JONES' Garage.—1916 Sun-Villiers, 2-stroke, 2-speed, electric lamps, horn, etc., quite as new: £35.—Broadway Muswell Hill, N.10.

JONES' Garage.—1917 Alldays Allon, 2-speed, handle-bars, control clutch, all lamps, horn, as new, unscratched: £42/10.—Broadway, Muswell Hill, N.10.

JONES' Garage.—3½ h.p. 1916 Abingdon, King Dick, T.T. model, as new, all lamps, a fast mount: £45.—Broadway, Muswell Hill, N.10.

JONES' Garage.—Norton Combination, lamps, horn, nice machine, fast: £85.—Broadway, Muswell Hill, N.10.

JONES' Garage will have all other makes as soon as the makers start supplying.—Broadway, Muswell Hill, N.10.

JONES' Garage, short bus ride from either Finsbury Park or Highgate Tube Railway.

JONES' Garage.—1916 semi-T.T. 3 h.p. Enfield, as new: £55.—Broadway, Muswell Hill, N.10.

JONES' Garage.—1914 Zenith-Gradua, 3½ h.p.: £45.—Broadway, Muswell Hill, N.10.

JONES' Garage.—1917 New Imperial-Jap, 2-speed, like new, all lamps, horn, etc.: £45.—Broadway, Muswell Hill, N.10.

JONES' Garage, short bus ride from Finsbury Park or Highgate Tube Station.

JONES' Garage will be pleased to give you fuller particulars of any machine or machines upon request.

JONES' Garage.—1914 4 h.p. Triumph and Coachbuilt Sidecar, 3-speed, new Dunlop tyres, new cylinder and piston, perfect: £65.—Broadway, Muswell Hill, N.10.

ISLE OF WIGHT Motor Cyclists should see Witham Bros, 133, High St., Newport, about their new monst. Earliest deliveries of Allon, A.J.S., Ariel, Clynco, Levis, Triumph, etc. Catalogues on request. Prompt repairs by skilled mechanics. Full range of tyres and accessories. [5109]

The Horse-power of Motor Cycles.

NOT once or twice only, but many times we have pointed out the necessity for some combined action and universal agreement on the matter of the horse-power rating of motor cycles. At the present time, although a certain amount of agreement exists with reference to one or two popular sizes, every manufacturer is a law unto himself, and consequently nominal horse-power bears no constant relation to engine capacity. It has become customary to designate an engine of 500 c.c., or thereabouts, $3\frac{1}{2}$ h.p., but one engine of 488 c.c. is commonly called 4 h.p.; another (a four-cylinder of 496 c.c.) is rated as 5 h.p. A certain twin engine of 430 c.c. has been used by several makers, some of whom call it 3 h.p., others $3\frac{1}{4}$ h.p. Engines up to 550 c.c. are frequently known as $3\frac{1}{2}$ h.p., but some years ago a 3 h.p. engine had a capacity of only 353 c.c. Many more instances could be given, but the foregoing will suffice to show how much confusion at present exists in the rating of nominal horse-power, and consequently in the minds of novices. For instance, we have been asked whether, in the event of a certain $3\frac{1}{2}$ h.p. engine (554 c.c.) proving to be insufficiently powerful for sidecar work in a given district, a 5 h.p. (496 c.c.) would be more suitable. This clearly shows the need for some recognised formula upon which makers shall base the nominal horse-power rating.

A Suggested Rating.

Now, for several years, we have insisted that a motor cycle in good tune should be capable of producing 1 h.p. for every 100 c.c. of its capacity, and we have suggested that makers should rate the horse-power of their motor cycles upon this basis, which has the great advantages of simplicity and accuracy. As time goes on and engines improve it may be desirable to reckon 1 h.p. per 80 or 90 c.c., but at the moment we think 100 c.c. will meet the case. Of course, we do not mean to imply that the

suggested rating gives a true estimate of the utmost power of which an engine is capable, and we do not think it desirable that the latter should be given as a figure denoting nominal horse-power, even if it can be maintained for a considerable time. It is quite possible for a 500 c.c. to show something like 11 h.p. on a brake test, but it is only very rarely that such a power output would be demanded of it on the road.

Some Existing Formulæ.

There are, of course, many horse-power formulæ in existence. Of these the R.A.C. and Poppe are simple, but quite absurdly inaccurate when applied to motor cycles. The inadequacy of the former, which is also known as the Treasury rating, was very clearly demonstrated in our columns at the time when it was proposed to tax motor cycles on a horse-power basis. With regard to the latter it is only necessary to point out that it gives the horse-power of the usual 500 c.c. single as 4.67 and that of a 425 c.c. twin, which is most obviously of less power, as 5.62. The formula generally known as the Dendy-Marshall, but which more than one engineer claims to have originated, is excellent for showing the utmost capacity of an engine, when used in that form which takes revolutions per minute into account. The Rüde and the Hospitalier, the latter being another formula taking account of "revs.," both give good results when the average running power is wanted, while the Lanchester and S.M.M.T. formulæ may be ruled out as being unnecessarily complicated.

In support of our often repeated suggestion we would urge its extreme simplicity, which is desirable in any case, but especially so if taxation by horse-power should again come to the fore. It should be remembered, too, that the A.C.U. for competition purposes—wisely we think—divides motor cycles into classes on their capacity alone, entirely ignoring the nominal horse-power given by the manufacturers.

Occasional Comments

by "Ixion"

Police Traps.

EVERYBODY admits that crime is on the increase, especially amongst juveniles, who have been relieved of salutary discipline by daddy's absence on active service. Yet this is the time selected by the police authorities to pester the small handful of motorists with a type of surveillance which was always silly and apt to be ridiculous in its incidence. One might as well instruct a fire brigade to patrol the streets watching where smokers threw their matches, and leaving an empty fire station to receive brigade calls. The average motorist frankly despises the legal speed limit, which is a piece of camouflage invented by dishonest politicians to smooth down ignorant prejudices. It was never intended to be enforced, and cannot be enforced. It leaves the public just where they always were—at the mercy of the commonsense of individual drivers, who generally know that 10 m.p.h. is quite as often legal but dangerous, as 30 m.p.h. is illegal but safe. This tongue-in-the-cheek legislation is now foolishly exploited by certain police areas to the neglect of far more urgent duties, and for the profit of local funds. It is high time that this obsolete regulation was replaced on the statute book by a "dangerous driving" regulation. In the meantime, authorities who exploit it show that they misinterpret their responsibilities.

Clean Run.

THERE was nothing spikier in creation than the 1914 type of aeroplane. Bits of wire and levers and kingposts and instrument fittings and turn-buckles and piping and exhaust pipes and other oddments bristled out of its every surface and corner and angle quite incredibly. Time went on, and wind tunnel research proved that efficiency demanded smooth surfaces and streamlined projections. It must have seemed a pretty hopeless task to smooth out the irregularities of a machine which resembled a game at spillikins more than anything else on earth; but it was done, as a glance at one of our latest fighters will reveal; they are like a winged swordsheath. Now motor cycles are also inconceivably bristly. They have no mechanical modesty, but blazon forth to the world their every part; in fact, I can never understand how their innate effrontery permits them to conceal their pistons. The handle-bar is a mass of clips and nuts and levers; the engine is covered with all manner of protruding details, and the latest countershaft gear boxes look like an engineer's scrap heap, silver-plated. None of these things matter where locomotive efficiency is concerned; our speeds hardly call for streamlining and varnished exteriors. But these chinks and crannies and corners are an intolerable nuisance to the type of owner who likes a clean machine. The cleaning of the average motor cycle after the briefest run in bad weather demands illimitable patience, illimitable paraffin, and a glorified outfit

of scrapers and brushes resembling a leviathan's manicure set. I dreamed last night of a motor cycle equipped with a streamlined gear box and crank case, forming a single unit, and topped by a polished aluminium cylinder block, as smooth as a flapper's cheek; whether it concealed water-cooling or formed the cowl of an air-cooled four-cylinder, my dream did not reveal. Motor cycles are not as bristly as they used to be; I once owned one which had five 6in. levers on the top tube (two carburetter, one ignition, one compression tap, one silencer cut-out), and if one leapt too far forrard in essaying a jump mount, the results were painful to a degree. We have left that sort of thing behind, but we are uncommonly slow in realising that quite 50% of our riders dislike wasting time, and yet prefer a clean mount.

Valve Spring Fastenings.

A CORRESPONDENT enquires whether our engines are likely to follow aero practice and drop the slotted stem and cotter method of securing the caps of valve springs. Most aero valves

Valve spring collar retaining device as used on aeroplane engines.

are fitted with a coned spring cap, which is pushed up against a pair of split cones by the spring: internal shoulders on the cones engage annular grooves in the head of the valve stem. This system avoids weakening of the valve stem by a slot and is easily refitted on overhead valves of generous size. Our valves do not break at the slot, and are usually somewhat inaccessible, especially when a spring-holding tool is in position. The ordinary slot and cotter is probably the best for side

m.o.v. especially in conjunction with such a neat little spring-holding gadget as the Triumph Co. supply.

Technical Policy.

I DARESAY readers have recognised that the genesis of a sound cycle car may have the most far-reaching effects in the whole motor cycling industry. In past years the British policy concentrated on the double-purpose machine. With the exception of a few lightweights most British machines were adaptable either to sidecar or solo work, and were, indeed, frankly constructed with that end in view. Now the group of firms associated with the A.B.C. Co. announce a fundamentally different policy. Conceiving that it is possible to produce a sound cycle car, they eliminate the heavy sidecar *de luxe*, and down come the c.c. and weight of their bicycle with a bang. Naturally so, since it is designed for a small and constant load. The question arises whether motor bicycles of 3½ h.p. to 8 h.p. would presently dis-

Occasional Comments.—

appear from other firms' catalogues if the cycle car should prove itself at a low price? The answer is probably in the affirmative, but there are a few caveats. For a sturdy youngster there is no solo sensation which quite comes up to road-eating on a real heavy, high-powered "hogbus" of 8 h.p. Again, some riders dislike "revs," and the small engine cannot offer high speed on a high gear. Finally, the cycle car is not merely a substitute for the sidecar outfit, but would deprive most of its owners of all solo riding—the man who formerly owned a bicycle and a sidecar could not always run to a bicycle and a cycle car. In case the cycle car makes good, a change of policy by motor cycle manufacturers seems probable, especially as cheap four-wheeled cycle cars would have far wider sales than any three-wheelers.

A Folding Prop.

A FEW months back a medico discoursed very interestingly in our columns about his ideal motor cycle. It struck me that on the whole he was trying to compress the Yankee ideals of complete equipment into the dimensions of a baby two-stroke, and that he would be lucky if his steed scaled much under 3 $\frac{1}{4}$ cwt. But I relished much his suggestion of a folding prop on the near side of the 'bus. Whenever we stop with a standard machine three alternatives confront us, and each is unpleasant. If there is a wall handy, we try to balance the jigger against it, which often necessitates buck-jumping 3 cwt. up a 6in. kerb. As we depart the machine begins to slide away, scrapes the levers off one end of the handle-bar, and then stabs its tank heavily with the inside grip. If the stop occurs in the country we discover a hump by the edge of the road

and balance the jigger against it. We turn away to light a pipe, and the footrest eats through to the base of the soft mud hump. The machine side-loops noisily into a ditch full of manure and nettles. Educated by such experiences we finally learn to use our stands.

The Unpuncturable Tyre.

MY note of February 27th on the Rapson tyre has provoked a letter from the inventor, who desires me to say that his tyre is a "pukka" pneumatic, from which I augur that it must be adapted for our use, no less than for the lordly motor car. I made a mistake in apostrophising him as the Napoleon of the motor industry, for the reference provided him with the excuse that Josephine was calling, just when his disclosures were getting really interesting. Anyhow, readers will be glad to know that the firms behind the production of the invention are a guarantee of its practicability, and Mr. Rapson may rest assured that, when he offers the world a tyre which cannot puncture, motor cyclists will necessarily be even more interested than car owners. Dear me. What times we live in. Zeppelins that rather enjoy being perforated by ten drums of "tracer." Pocket telephone receivers, on which you're to be rung up by wireless from Hong Kong whilst climbing Beggar's Roost. Dreadnoughts which can't be torpedoed. Tyres which don't puncture. If any big inventor is hunting round for some unsatisfied public need, let me say I am prepared to pay through the nose for a bottomless purse.

(Top) Passing through the village of Downes. (Bottom) Members at the Three Horse Shoes, Knockholt. Douglas, Matchless, Harley-Davidson, and Triumph outfits, also a Morgan, were among the makes represented.

THE 3 h.p. A.B.C.

Flat Twin Engine, 68.6 mm. \times 54 mm., 398.4 c.c.; Four-speed Gear Box, Gate Change, and Spring Frame.

The new spring frame 3 h.p. A.B.C., the engine of which is a flat twin fitted transversely in the frame. Many of the features are revolutionary in design, yet the ensemble is decidedly attractive.

SOME preliminary details regarding the A.B.C. post-war programme appeared in *The Motor Cycle* of November 28th, 1918, page 475. Since that date items in the 1919 programme have undergone some modification, and the engine and other parts have been considerably improved.

The first impression one receives of the new A.B.C. is that it is designed as a motor bicycle. It is no slavish copy of any existing design, but a bold attempt to construct a self-propelled two-wheeler on original lines, but with no suspicion of freakishness. The designer's ingenuity has had full play, and yet, with all its originality, there appears to be no reason why the machine should not be successful in every way.

Probably the first characteristic of the machine which strikes one is the lack of void spaces between wheels and frame and about the engine. It is a motor cycle designed around an engine gear unit rather than an over-developed bicycle fitted with an engine, and the result is most pleasing to the eye. It requires attention at one point, however, to make it conform to the ideals of a large coterie of all-weather riders. We refer to the mudguarding and the chain cover. We think the rear guard would be improved by the extension of the valance between the chain and the tyre, and that a totally enclosed chain would be better than the threequarter guard shown on the model illustrated.

When the early successful A.B.C. motor bicycles are recalled, and the immense experience in the construction of aero engines that the firm has had during the past four and a half years is taken into consideration, it is not surprising that the

new A.B.C. clearly shows how much the firm and its designer, Mr. Granville Bradshaw, have learnt during this period.

Mechanically-minded readers naturally turn first of all to the engine, or, rather, the power unit, for in the new A.B.C. the engine and gear box are in one. As previously announced, the cylinders are placed athwart the frame, but this does not render the machine unreasonably wide.

The former successful A.B.C. practice of using steel cylinders with cast iron heads has been retained. As the cylinder is of absolutely uniform

design, there are no unnecessary pieces of metal to cause hot spots and distortion. The hemispherical cylinder heads are held on to the steel cylinders by six bolts. The valves are of the overhead type, made of unbreakable steel, with volute springs in place of the more usual helical type.

At first sight, there is a tendency to regard such items as tappet rods and rockers as being of exceedingly light construction and possessing very small wearing parts, but it must be borne in mind that in the design of the new A.B.C. lightness, as much as power, has been taken into consideration, and efficiency has been the watchword of the firm. All

The power unit, showing position of the dynamo under the crown wheel casing.

The 3 h.p. A.B.C.—

moving parts, such as tappets, bearings, and rocker bearings, are bushed with phosphor bronze, and the rockers themselves work on a broad arrow-shaped bracket screwed on to the cylinder head. Needless to say, the tappet rods are adjustable.

The A.B.C. cylinder and detachable head. One long holding-down bolt is shown.

The small ends of the connecting rods are bushed to take the gudgeon pin, which also floats in the piston, and the big ends are provided with roller bearings kept in position by a split collar which is recessed to engage with the crank cheek, which prevents it from rotating on the crank pin. While these split collars are not a new feature in A.B.C. design, the method of holding them in position is quite novel. Ball-bearings are employed for the two-throw crankshaft. Die-cast aluminium pistons are adopted, having two rings at the top and a scraper ring, while the base of the piston is of slightly smaller diameter than the remainder, and is drilled with a series of holes, which relieves all oil pressure and prevents oil from being forced into the combustion heads.

At the bottom of the vertically divided crank case is a pressed steel oil sump, holding sufficient lubricant for 1,500 miles. Below this sump is situated a gear-type oil pump which is always immersed in oil. This pump forces lubricant through an

Aluminium piston with concave head.

oil-way in the crank case directly on to the connecting rod big ends, and the other working parts are lubricated by oil-mist. In the oil feed system, on the right-hand side of the crank case, there is a Rotherham oil indicator, by means of which the rider can ascertain that the oil is circulating properly.

The timing wheels are five in number, the topmost driving the magneto; next comes the driving pinion; then the camshaft pinion, which runs on ball bearings; next an intermediate wheel for reducing the speed of the oil pump, which revolves at one-sixth of engine speed;

and, finally, the oil pump wheel itself. The arrangement of the timing gear is an exceptionally pretty piece of design, and the neat little camshaft is a perfect car job in miniature.

The magneto is a special type C.A.V., and is situated on the top of the crank chamber in a most accessible position.

Its position, and the design of the engine, permit of extremely short high-tension wires being used; in fact, Mr. Bradshaw told us that he had considered the advisability of doing away with the insulated high-tension wire altogether, and having a single copper wire leading from the high-tension terminals to the plugs.

Clutch and Gear Box.

Forming part of the crank case casting is the flywheel housing, the flywheel embodying the clutch. This is of the self-contained inverted cone type and Ferodo lined. The clutch spring is of ample strength, so that no adjustment should be necessary, while sufficient leverage is provided on the control to render the clutch withdrawal an extremely easy matter. This is effected by means of a twist grip on the handle-bar. The clutch is operated by a long rod passing right through the hollow five-splined mainshaft of the gear box, and actuated at the rear end by a lever on the clutch control shaft. When the clutch member is out it is entirely free, and runs on the gearshaft only. The splined shaft runs

on roller bearings at its forward end, while the secondary-shaft is internally splined and also runs on roller bearings, and carries the clutch.

The gear box provides four speeds, and the gear wheels, it may be mentioned, are ten pitch, and are the same size as those employed on light cars. It is also interesting to note that the layshaft runs on ball bearings, while the final

Split collar on crank pin.

drive to the rear is by bevel, the bevel being in one piece with the splined shaft, and engaging with a substantial crown wheel running on two ball bearings in a casing behind the gear box. One end of this shaft carries the chain sprocket, while on the other end is a gear wheel running in oil, intended to drive the dynamo. The final drive from the sprocket to the rear wheel is by chain, the well-known A.B.C. "cush" drive being incorporated in the rear wheel sprocket. This is a system, it may be remembered, consisting of insulating the gear wheel from the shell attached to the hub by means of a series of large rubber buffers, which

Method of housing the power units. The ample front and under-shield is a commendable feature.

The 3 h.p. A.B.C.—

Showing the frame design and the front and rear springing system.

effectually take up the initial shocks of the engine, rendering the drive extremely smooth.

The change-speed lever works in a gate on the gear box and is of the rocking pattern, and similar to that found on Rolls-Royce and other first-class makes of cars. It enables the change-speed lever to be moved from side to side without the slightest effort, so that there is no danger of upsetting the rider's balance.

The carburetter is the standard A.B.C. pattern, and is warmed by means of a special jacket surrounding the branch from the main inlet pipe to the carburetter, which is connected by a small pipe to one of the exhaust ports. The position of this chamber is important, as it heats the mixture equally for each cylinder.

The crankshaft and connecting rods.

Since the oil supply is carried in the sump, the whole of the tank is available for petrol; so that the full capacity of well over two gallons can be devoted to the fuel. The mounting of the tank is ingenious. It is anchored rigidly at the rear while at the front it is carried on a light steel bracket cross-braced diagonally. This method of mounting, while ensuring a practically solid fixing, entirely relieves the tank of all frame stresses.

Frame Details.

The frame is a notable departure from standard practice. There is a single top tube, while the remaining members are duplicated, forming what may be termed "a double rectangular loop." The two main members are of sufficient width to accommodate the engine, and are so designed that in the case of a fall the engine is quite safe from damage. The forward and lower portions of the frame are filled in with sheet metal, so that the under portion of the engine is protected from mud—a most important matter—while the front extension protects the working parts of the engine and the rider. Air-ways are cut in suitable positions in

the tray, and are fitted with adjustable louvres, so that in the event of very bad weather being encountered, or necessity being found to pass a water splash, the draught may be cut off altogether, and the engine is then entirely protected. Even when these doors are closed, we are given to understand, unless the engine is driven to its fullest capacity, no overheating will ensue.

Underneath the bottom shield are two cross members, not shown in the illustrations, which serve to carry the power unit, and this can be removed by undoing four bolts. The rear portion of the frame naturally is sprung, and bears upon two roller bearings situated ten inches apart on the rear members of the frame. This arrangement gives great rigidity and lateral stability, while the roller bearings prevent wear at this point.

Springing System Minus Shackles.

Owing to the ingenious form of springing employed, no shackles are used. The springs are practically two quarter elliptical springs joined together at the thin end by the main leaf being common to both and forming the top of one set of spring leaves and the bottom of the other. At first sight, it would seem that the midway point must be weak, but since this is the point of flexure and there is no other stress at this point, such is not the case. There is no doubt that extreme flexibility is obtained, and the riding of the machine should be most comfortable.

Since the preliminary design of the 1919 A.B.C. was reproduced in *The Motor Cycle* of December 12th, 1918, some modifications have been made with regard to the spring fork. The spring is of the quarter elliptic type, and the thicker end is anchored to a special stay on the front axle, so as to do away with bending stresses on the head itself. All links and pins in the front fork work in bronze bushes. Adequate means is provided for lubrication, but in case of wear these parts can be replaced.

Instead of mounting the handle-bars in the usual manner, the A.B.C. handle-bar is carried in a special bracket forming part of the forks. This bracket allows of considerable adjustment, but does not allow the handle-bars to be twisted; consequently it is impossible for any accident to occur through slipping at this point.

All wires pass through the handle-bar, and the control is simple. For instance, as mentioned before, the left-hand grip works the clutch, beneath it is the exhaust lifter, while on the right bar is situated the front brake lever. The two other levers work the spark and throttle.

Internal expanding brakes are fitted to both wheels. Mention was made in previous articles of cone brakes, but it has been found that the internal expanding type is the most satisfactory from the constructor's point of view.

The Hubs and Brakes.

Even the hubs are designed by Mr. Bradshaw, and these are provided with a larger flange on one side than on the other, the larger flange being for the attachment of the brake drums, the bolts holding the drum on to the wheel being below the points of attachment of the spokes. The spindles in both wheels are withdrawable, so that if a tyre repair should be necessary either wheel can be easily removed.

Mention has previously been made of dynamo lighting. In this case, the dynamo will be carried below the crown wheel casing, and behind it there is just room for the battery.

A kick-starter will be provided for all models. On the undershield are mounted two aluminium plates upon which the driver's feet rest. Throughout the design points of convenience have been

Change-speed gate on the side of the gear box.

well studied, and every care has been exercised by the manufacturers to leave nothing undone for the rider's comfort.

An idea suggested to us by Mr. Bradshaw, which he may carry out, was the fitting of a toolbox underneath the crank case containing two drawers in which the tools are let into the solid wood, so that it is impossible for them to be damaged by rattling one against another.

The weight of the machine without fuel is 175 lb., and overseas purchasers will be interested to hear that the ground clearance is 6½ in.

The 1919 A.B.C. has now reached its final stage, and is ready to be handed over to the manufacturers to produce in quantities.

We cannot refrain from congratulating Mr. Bradshaw on the excellent design of the engine, and, indeed, of the whole machine, and wishing the Sopwith company success in its enterprise.

1919 Competitions — Olympia.

Interview with the General Manager of the Cycle and Motor Cycle Manufacturers' and Traders' Union.

.....
 No T.T. Race. Olympia Show, November 24th to 29th. The Question of the A.C.U. Six Days'.
 Prize Distribution Scheme for Clubs.

AS was only to be expected by all who are conversant with reconstruction difficulties, the manufacturers have definitely decided not to support a Tourist Trophy race this year.

This information was imparted last week to *The Motor Cycle* representative by Mr. Alf Bednell, the general manager of the Cycle and Motor Manufacturers' and Traders' Union.

It will be appreciated that conditions prevailing at the present time in the manufacturing world are such that the greatest effort is required to re-establish the industry in the motor cycle world, and that preparations for a T.T. race would retard the production of the new machines for which there is such a great demand. Many of the makers have not yet commenced delivery of even their pre-war models which they are reintroducing, and while these conditions prevail, the manufacturers naturally veto any suggestion to hold a T.T. race.

The Show.

Readers of *The Motor Cycle* will be pleased to learn that at a committee meeting of the Union held on Tuesday of last week it was decided to hold a show at Olympia from November 24th to November 29th inclusive. This gives a clear week between the closing of the car exhibition and the opening of the motor cycle show to enable the cars to be got out of Olympia and the motor cycle exhibits to be staged.

It has been decided to take over the S.M.M.T. scheme of stands and decorations, and to adapt them to the special requirements of the C. and M.C.M.T.U. show. This means that all stands will be uniform and in the hands of one contractor instead of the pre-war method of separate contractors for each exhibitor, which caused a great waste of labour—a question which must of necessity be closely considered this year.

International Exhibits.

Mr. Bednell advised us that the exhibition would be of an international character, goods of enemy origin only being barred. As hitherto, Olympia will be the only show at which will be shown representative motor cycles of the entire world, and no greater proof of British manufacturers' confidence in their products is needed to show that they do not fear foreign competition, since they invite their competitors in U.S.A. and the Continent to exhibit at the Union's own exhibition.

The Six Days Trial.

Although Mr. Bednell could tell us nothing authoritative concerning the attitude of the trade towards the proposed A.C.U. Six Days Trial for 1919, we gathered that while the makers do not think such a trial would be in any way conclusive, they would do their best to support the A.C.U., which they

hold in respect. If an A.C.U. trial is held, there is a feeling that it should be late in the year in order to permit them to enter their new models if possible. Hence, in all probability, the trial will be held in the late summer, but not later than September 29th, when summer time ends.

Quite a large percentage of makers are of opinion that the trial should be less than of a full week's duration, in order that the competitors would not have to be away for two week-ends as in the past. This would necessitate the trial being for about three days only, with one day for examination at the finish.

Standard Machines.

There also appears a decided tendency for the makers to favour a trial of standard machines with the gear ratios and sidecars usually sold by them instead of permitting the use of freak gear ratios, specially light sidecars, etc. This has frequently been advocated in *The Motor Cycle*, and is a view shared by the majority of our readers. But it must follow that, if standard machines are to be insisted upon, the course should not include freak hills which can only be climbed on freak gear ratios.

Prize Distribution.

Mr. Bednell further informed us that a competitions committee had been appointed to consider 1919 competitions, and that this committee is in communication with the A.C.U. on this matter. At the next meeting of the motor cycle section of the Union, the competitions committee will recommend that every encouragement be given to private clubs to hold local competitions confined to their members, and also that the pre-war Prize Distribution Scheme be resuscitated.

Altogether we were favourably impressed by the attitude of the Union on many matters affecting the rider, and no doubt there is a genuine desire on the part of the trade to improve the standing of the industry, both in the world of engineering and in the eyes of motor cyclists generally.

THE COST OF PETROL CONTROL.

THE question was asked in the House recently as to how many officers and servants there were in the Petrol Control Department, the amount of their salaries, and the total received from petrol licences during the year 1918. The reply was that the staff consisted of 438 persons whose salaries amounted to £39,620; in addition, ten civil servants were lent by other departments whose salaries totalled about £4,000 per annum. The motor spirit licence duty realised £278,091.

THE Whaley Two-stroke Engine.

An Engine-gear Unit to be Introduced by a Firm new to the Motor Cycle Industry.

A NEW engine is always interesting to the motor cyclist, and an engine the production of which brings into the motor world a firm of engine unit manufacturers new to the industry is of unusual interest. The designer of the engine described, Mr. R. S. Whaley, of Edgbaston, Birmingham, is already well known, having been connected with several of the leading motor cycle firms for many years past. He has evolved a simple two-stroke engine and gear unit, and a carburetter which will embody certain departures from accepted practice, but of which the final design is not completed. High-class accurate workmanship in the best of material will be an outstanding feature. This engine will be marketed as a complete unit suitable for building into even the smallest lightweight frames, and at a very reasonable price.

We are not permitted to divulge at the moment the name of the manufacturers of the engine, but they are an old-established firm, and have gained high standing in other branches of mechanical work, their plant being capable of production on a large scale.

The engine has a bore of 69 mm. and stroke of 78 mm., giving a capacity of 292 c.c. It is therefore slightly larger than the average two-stroke lightweight engine. Its nominal h.p. is 2½, but on the bench we are told an experimental engine developed a full 5 b.h.p.—a very promising showing for any engine of this capacity. The cylinder is cast with a domed top, and has fins of ample area, which will be finished to a clean thin outline. Transfer, inlet, and exhaust ports present no new features, except that a small baffle is formed at the bottom of the transfer passage to prevent oil being thrown up on to its walls.

A somewhat unique feature of the piston is the very narrow rings, of which there are three, in separate grooves at the top, each ring being only ⅛ in. wide, and similar to those used in aluminium pistons.

The deflector head is concave—a shape which is said considerably to assist the expulsion of the exhaust gas. The skirt is drilled as an aid to lubrication, and a small projection is cast

Sectional view of the engine. Note the leather universal joint coupling the magneto to mainshaft. To illustrate the deflector in section the piston head is shown separated from the skirt

General layout of the Whaley engine gear unit, showing chain case in position.

inside the piston head directly over the gudgeon pin, its function being to collect oil and drop it on to the little-end bearing. Another unusual feature of the piston is the gudgeon pin, which has three diameters, the largest of these being in one boss in the piston and the smallest in the other, the small end bearing working on the middle length. It is pinned at the smallest end. The connecting rod has a plain bearing split big-end, and the balanced

crankshaft is also on plain bearings.

Accessibility.

By removing the baseplate of the aluminium crank case, dividing the big end, and taking off the fly-wheel, chain and one oil pipe on the magneto side, the crankshaft, with the magneto and its platform, can be removed without taking the engine from the frame.

Another unique feature of the unit is the magneto drive. The detachable side plate of the crank case, which carries one of the main bearings, has cast integral with it a platform for the magneto, which is coupled directly to the crankshaft through a coupling which permits of easy adjustment when timing the engine. Whilst this arrangement necessitates the magneto projecting over the footboard, it is not in the way of the rider's feet so much as might be imagined. A neat

The two-speed gear box which incorporates a kick-starter and cork insert clutch.

The Whaley Two-stroke Engine.—

aluminium cover will be provided to prevent damage to the contact breaker. The saving in constructional cost by dispensing with chain drive and its cover plates is obvious.

Lubrication.

It is intended to use a pressure feed oil pump on the tank, and three leads are provided—one to the cylinder wall and one to each of the main bearings. Drilled oilways in the crankshaft lead to the big end bearing.

A neatly designed compression release valve is disposed at an angle in the cylinder head, and a by-pass tube is taken from it into the exhaust pipe to obviate the objectionable hissing which occurs when the valve is made to exhaust into the open air.

The Transmission.

A short chain transmits the drive from a sprocket bolted on the inner side of the flywheel to a two-speed gear box, and is effectively enclosed in a substantial cover which is formed to cover the flywheel. This chain case has a hinged side plate, the opening of which exposes a considerable portion of the chain for inspection.

The domed cylinder head with a release valve and plug.

Two-speed Gear, Clutch, and Kick Starter.

All joints of the gear box are formed so as to obviate leakage, as the aluminium casing is designed to give a big oil capacity, in order that the gears will run in an effective oil bath. The gear wheels are machined in Ubas steel, and heat treated, the layshaft gear wheels being in one unit with phosphor-bronze bushes, and revolving upon a Ubas spindle.

The method of operating the gears is well designed, permitting easy adaptation to any frame. A simple geared kick starter is provided, together with a light pulley for the final belt drive, and a clutch of the cork insert type following accepted practice.

We understand that an experimental engine has been running on the road for some considerable period, and has given complete satisfaction.

No doubt many motor cycle manufacturers will be interested in the possibilities of this new engine with a view to adopting it as the power unit for one of their future models; and whilst at the moment the production of this proposition is only commencing at the present time, it is hoped to put a fairly large number on the market in the very near future.

A NEW AUTOMATIC LUBRICATOR.

Drip Feed Device Controlled by the Throttle Lever.

A LUBRICATOR designed to supply oil to the engine in proportion to its speed and the work it is called upon to do is the invention of Mr. Robert J. Nash, of Herald Chambers, Martineau Street, Birmingham. It is a neat-looking device, somewhat resembling a miniature carburetter, intended to be fitted to the under side of the oil tank. It consists chiefly of a constant level reservoir containing a float, which regulates the supply from the tank by means of a ball valve.

In operation the oil is fed from the float chamber through a passage, having an adjustable orifice, to an airtight glass drip chamber, the upper end of which communicates, by a small bore tube, with the air intake of the carburetter; while at the lower end there is a small diameter passage opening into the end of a pipe which conducts the oil to the crank case.

The pressure reduction provided by the closed crank case of either a four or a two-stroke engine is in excess of that produced by the maximum flow of air through the carburetter; in consequence the oil feed has no tendency to do other

Nash's automatic lubricator in section showing the float chamber, and, at the top, the air suction pipe to the intake of the carburetter. The vertical tube at the bottom conveys the oil to the crank case.

than pass through the lower passage to the crank case. The orifices communicating with the carburetter and with the crank case pipe are so proportioned that the suction caused by the rising piston acting alone is only approximately sufficient to overcome the initial resistance of the oil feed, hence the value of the depression produced by the carburetter, as a ratio of the air flow, and therefore of engine speed, to regulate the proportion of the oil flow.

In action the suction of the air intake at the carburetter draws oil from its level in the feed passage to the small reservoir directly above the nozzle in the glass drip chamber; then the suction of the rising piston, aided by gravity, draws it through the small orifice in the floor of the drip chamber. A small needle valve, operated by a knurled nut, permits of adjustment of the drip similarly to the usual ordinary drip feed regulator.

One would assume, as the suction caused by the rising piston draws oil through this small passage, that the pressure when the piston descends would force it back again, or, at least in a two-stroke, the oil pipe would form a way of escape for the gas under compression in the crank case. In practice, however, this has not been found to be so, but, in any case, a small non-return valve in the lower end of the oil pipe would overcome this defect.

The body of the lubricator is of die-cast aluminium, with nickel-plated brass parts. The tank flange and the screwed parts carrying the device are of ample dimensions, and a simple cut-off valve is provided through the tank for use when the machine is not running. This latter does not appear to be entirely necessary, as the action of the float would automatically cut off supplies after a certain level in the chamber had been reached.

Alternative design of attachment to oil tank and drip arrangement.

Exterior of the Nash automatic lubricator.

THE BUYERS' GUIDE.

Current Prices and Delivery Dates for 1919 Motor Cycles.

SINCE we last published the Buyers' Guide in the issue of January 30th, there have been many additions to the list of makes, but very few alterations in the prices quoted. One British Excelsior two-stroke lightweight model is altered, and, instead of having a three-

speed counter-shaft gear with clutch at £62, a two-speed gear with clutch and kick-starter model is quoted at £60. The price of the Metro-Tyler is now £46, instead of £45, and the Velocette prices have been altered from £40 and £42 to £48 and £50. The Radco, on the other

hand, is now lower in price than first quoted, the single-gear model being £37 16s. instead of £42, quoted as an approximate figure. Interesting additions to the last list include the 3½ h.p. and 5-6 h.p. Rover and the Abingdon machines.

ROAD REPORTS.

Owing to the heavy R.A.F. lorries, part of the Westerham Road has subsided between Biggin Hill and the "Fox and Hounds." The road runs on the top of the chalk hills, and a warning board has been erected, urging drivers of traffic to keep to the centre of the road. The road has subsided several feet and further trouble is feared. Road-menders last month were breaking the

ice in the larger holes of the road with pickaxes, and filling with stones. A very rough and ready method!

Warrington-Preston.—Fair. But roads in the Wigan district are very bad.

Preston-Lancaster.—Excellent, except for one bad patch near Lancaster.

Lancaster-Kendal, *via* Milnthorpe.—Perfect nearly all the way. A little broken near Kendal and Milnthorpe.

Kendal to Newby Bridge, *via* Crook.—Good.

Newby Bridge-Ulverston.—Good, except for three or four bad patches.

Ulverston-Barrow.—Good, except in about six places, where the surface is in an appalling condition.

The Coventry-Birmingham road is good, except within the Coventry boundary and on Meriden Hill.

NOTES ON OBTAINING B.H.P.

How Horse-power can be Calculated from Indicated Diagrams and Other Data.

IN these notes it is proposed to show a method of working out the b.h.p. of a four-stroke petrol motor from the general dimensions of the engine and its indicator diagram. As it is clearer to select and fully work out an example than to deal in general terms, we will take an engine of the following dimensions:

Bore 3 in., stroke 4 in.

Area of piston head, 7 sq. in.

Maximum of r.p.m. permissible, 2,000.

r = radius of crank pin circle = $\frac{1}{2}$ ft.

l = length of connecting rod = $\frac{2}{3}$ ft.

x = ratio l/r = 4.

w = weight of reciprocating parts = $1\frac{1}{2}$ lb.

The indicator diagram is a graph showing the pressure in the cylinder throughout the cycle plotted against the position of the piston in its stroke, i.e., the volume of gas in the cylinder.

To obtain the diagram by actual test, involves the use of a special indicator, but if the maximum pressure of explosion, the compression pressure, and the pressure at the end of the working stroke are known, we can construct the diagram as the curves of compression and explosion follow equations which are approximately known. Fig. 1 represents the diagram obtained in this manner, the known pressures being taken as 300, 80, and 30 lb.-sq. in. respectively for this engine. For simplicity we shall not be far wrong in assuming the pressure during induction and exhaust as atmospheric (15 lb.-sq. in.) and the explosion as instantaneous, i.e., at constant volume. The first

Fig. 1.

Fig. 2.

step is to obtain the force on the gudgeon pin during the cycle, taking into account the atmospheric pressure on the crankshaft side of the piston, and the area of the piston. We therefore take a number of pressure values from the curves in fig. 1, deduct 15 lb.-sq. in. from each, and multiply the result by 7 (piston area). This gives us curves a and b (figs. 2 and 3), showing the force in lb. on the gudgeon pin due to the gases in the cylinder during compression and explosion respectively, the former being, of course, negative, as it tends to retard the engine. The next step is to ascertain the effect of the inertia of the reciprocating parts. If at any point in the stroke the angle traversed

by the crank from top dead centre is " α ," then at that point the force in lb. on the gudgeon pin due to inertia = $\frac{wv^2}{gr} \left(\cos \alpha + \frac{1}{x} \cos 2 \alpha \right)$

Where v = velocity of crank pin in ft.-sec., g = acceleration due to gravity = 32 ft.-sec.², and the other symbols have the meanings given above. In our case, $v = \pi \times \text{stroke} \times \text{revs. per sec.} = 35^2$ ft.-sec.: and therefore $\frac{wv^2}{gr} = \frac{1\frac{1}{2} \times 35^2}{32 \times \frac{1}{2}} = 344.5$.

Our formula may now be written $344.5 (\cos \alpha + \frac{1}{4} \cos 2 \alpha)$.

Then when $\alpha = 0^\circ$, inertia = $344.5 (1 + \frac{1}{4}) = 430.6$ lb. Again; when $\alpha = 180^\circ$, inertia = $344.5 (-1 + \frac{1}{4}) = -258.4$ lb.

And if $\alpha = 77^\circ$, $\cos \alpha = .2250$, $\frac{1}{4} \cos 2 \alpha = \frac{1}{4} \times -.8988 = -.2247$, and hence the inertia is zero.

By giving a number of intermediate values to α and working out the corresponding inertias, we get the inertia curves c and d (figs. 2 and 3), the inertia being taken as positive where it tends to accelerate and negative where it tends to retard the engine. (Note.—For this we have to obtain the position of the piston corresponding to each value of α , either by a formula or a graphical method.) By now adding the values at various points of the curves a and c , also b and d , being careful to note where positive and where negative, we get curves e and f , which represent the actual net force in lb. on the gudgeon pin for all points of the compression and explosion strokes.

Fig. 3.

Unfortunately, this force has to be transmitted through the connecting rod. Hence it is split up, part appearing as a force at right angles to the crank acting on the crank pin, called the *crank effort*, which does useful work; another part appearing at right angles to the line of stroke forms the *side thrust* of the piston against the cylinder, and again another part acting at

Fig. 4.

Notes on Obtaining B.H.P.—

right angles to the crank effort and forming the pressure on the bearings.

An easy graphical method of obtaining the first two forces is shown in fig. 4. On XX as the centre line of the engine we lay off the stroke AB, and dotted curve. At the correct distance and to scale we describe the crank pin circle. Then, for example, at the point D in the stroke, DE represents the net force in lb. on the gudgeon pin, CD being the connecting rod. Set off CF along the crank and DJ along XX, each to equal DE. Draw FG at 90° to XX, cutting CD produced at G, and draw JH at 90° to XX, cutting CD at H. Then to the scale of DE, FG represents the crank effort and JH the side thrust, in lb.

If we take a number of these force values from curves *e* and *f*, and present the results as in figs. 5-6, we get curves *g* and *h* showing the crank effort in lb. (and also torque, since crank effort \times length of crank = torque) and curves *i* and *j* showing the side thrust in lb., for all points of the compression and explosion strokes (fig. 6).

It will easily be seen that the crank efforts due to the inertia forces during exhaust and induction will balance out as far as torque taken over the whole cycle is concerned, but we cannot neglect their side thrust effect. We therefore apply inertia values from curves *c* and *d* to fig. 4, and so obtain the side thrust curves *k* and *l* which are shown in fig. 6.

Now we have all the particulars required. First, from crank effort curves *g* *h* we find that the average crank effort during compression and explosion is

Fig. 5.

Fig. 6.

375 lb., or, since the length of the crank is $\frac{1}{6}$ ft., and the crank effort is acting at right angles to the crank throughout, then average torque = $\frac{375}{12} \times 2 = \frac{187.5}{3}$ lb.-ft. (The average value is obtained by

taking a number of values from the curves, and dividing their sum by the number taken.) The work done by the torque per minute = $\frac{187.5}{3} \times 2\pi \times \frac{\text{r.p.m.}}{2} = 1,178,571 \div 3$ ft.-lb. (the torque being only available for one rev. out of two, we multiply by r.p.m. $\div 2$.)

Next, we utilise our "side thrust" curves to ascertain the losses due to piston friction, for friction is dependent on this thrust.

At this high speed, and with a small engine, the "coefficient of friction" might amount to .25, i.e., we assume retarding force on piston due to friction = side thrust $\times .25$. Now from our side thrust curves *i*, *j*, *k*, *l*, we find the average thrust during the cycle = 65 lb.

Therefore friction loss (due to piston) per minute = $65 \times .25 \times \text{stroke} \times \text{strokes per minute} = 16.25 \times \frac{65,000}{3} \times 4,000 = \frac{65,000}{3}$ ft.-lb.

So as not to inflict on the reader the process of determining the bearing and valve gear losses, we will assume that they amount to .6 of our piston friction loss.

Then total loss of work per minute = $1.6 \times \frac{65,000}{3} = \frac{104,000}{3}$ ft.-lb.

Now we have already determined work done by torque per minute = $\frac{1,178,571}{3}$ ft.-lb.

Hence useful work available from crankshaft = $\frac{1,178,571}{3} - \frac{104,000}{3} = \frac{1,074,571}{3}$ ft.-lb. per minute.

This is equivalent to $\frac{1,074,571}{3 \times 33,000} = 10.85$ b.h.p.

This power is high for the engine dimensions, it will be noted, because, for the sake of simplicity, the indicator diagram is drawn with no heat losses effect shown. Actually, a number of losses occur tending to reduce the gas pressure during the explosion stroke, and hence to reduce the power obtainable. "B. ENG."

The Benzole Position.

THE Automobile Association has issued a circular to its members from which the following is an extract: "While every possible means of relief is being vigorously sought, it is unpleasantly true that British benzole, every gallon of which should be used in Britain, is not being so used. Worse, vast quantities are being exported. This is a national calamity. Producers are not to blame. Distribution difficulties are acute; drums and tins are scarce. Co-ordination of supply is wanting. The National Benzole Association has been formed; its leaders are earnest business men. They tell us plainly that home-produced benzole shall be conserved to the use of British motorists if organised

British motoring will do its share. A standard specification has been prepared; all the responsible benzole producers will conform. It is at once our national duty and to our common interest to use benzole. Distribution is a knotty problem. It is being solved. Meanwhile, let us all make a start in however small a way. Buy British benzole always through your local A.A. agent. We can help you—we will help him. Buy benzole in fifty-gallon drums and keep it twenty feet from a dwelling place. The regulations are not difficult to comply with. Alternatively, get the local A.A. agent to store it for you. A large supply of fifty-gallon drums has been secured by the A.A. which can be hired."

An Example of French Design.

A Novel Adaptation of the Unit System of Construction.

OF more than passing interest is the motor cycle design submitted as an "ideal" by M. Henri Boursiac, of Rouen, which we illustrate on this page. The machine embodies many attractive features, including a spring steering pillar, spring frame, unit engine and gear, and side-by-side twin engine placed at an angle of about 36° from the vertical. The appearance of the machine is distinctive, but quite neat, and the spring frame does not involve any unsightly appendages.

The spring fork is somewhat similar to that of the Triumph, but in addition a vertical movement is provided by a substantial helical spring enclosed within the steering head, while for the rear springing the back fork stays are hinged just under the saddle and retained in the normal position by a telescopic spring-loaded stay from the bottom bracket. This construction, having four fairly distant points of attachment to the main frame, should overcome the lateral play bogey to a large extent. At the same time it necessitates special construction of the final drive.

A frame of the duplex type is embodied, and forms a cradle for the housing of the unit system and gear box. Other items in the cycle part of the specification include adjustable handle-bars incorporating twist-grip controls, an expanding brake on the front wheel, and a friction disc brake on the rear wheel. The front brake is operated by a lever on the handle-bar and the rear brake by the usual pedal.

A French reader's ideal design, embodying an inclined twin-cylinder engine with an overhead camshaft and a three-speed gear box integral with the engine.

It is intended that the side-by-side two-cylinder engine of 70 mm. x 80 mm. bore and stroke be built as a unit with the gear assembly, and ready access to all parts obtained by means of quickly detachable covers. The cylinders are set at an angle of about 36° from the vertical, and are provided with detachable heads which embody the valve seats, supports for the overhead camshaft casing, and pairs of lugs for the valve rocker spindles. Valve guides are screwed into this casting, and the valves inserted from the inside.

Plan view of the engine and gear box with the inspection cover of the latter removed.

The camshaft is shown as being driven by a vertical shaft between the two cylinders from a bevel on a cross shaft, which in turn is driven through bevels by the crankshaft. Both driving shaft and camshaft are enclosed in neat cases.

Under the exhaust rocker is an eccentric arrangement which acts as an "exhaust lifter." Roller bearing big ends are provided, working on the two-throw 180° crankshaft, which is drilled to form oil ducts.

Forced feed lubrication is employed, operated by a reciprocating pump situated at the lower end of the magneto driving shaft, which latter is rotated by a

Section of the engine and three-speed gear box. The extension of the oil pump shaft forms the magneto driving spindle.

The adjustable carburettor in section

An Example of French Design.—

bevel gearing from the crankshaft. The circulated oil returns to the large sump from which it is drawn by the pump through a filter. Contrary to usual practice, the neatly enclosed magneto and dynamo are intended to be situated on top of the tank and driven by the aforementioned shaft.

Two flywheels are shown—one at each end of the crankshaft which runs in three ample bearings. The drive is by bevel to a substantial multiple-plate clutch, the outer portion of which is in one with the primary gear box pinion, which latter is bored to receive the splined secondary shaft. The gear arrangement is of the usual six-wheel type with three sliding dog clutches, providing three speeds, with direct drive on top. A kick-starter operates through the layshaft.

A pair of gears at the end of the main shaft sets the final drive to one side. This carries the shaft out far enough to clear the rear wheel without excessive angle on the universal joint. The shaft between the gear box and the final bevel should be flexible owing to its being tubular and split down one side, as shown in the sketch on this page.

The designer has also evolved a carburetter intended primarily for this machine, but it appears to have possibilities for use on any other type of engine. Reference to the section will show that the instrument consists of the usual bottom-feed float chamber with a passage leading to the jet opening into the throttle barrel. Opposite the jet, in a special chamber, is a kind of spring-loaded piston with an extension which forms an air throttle. To this extension is attached a

needle which regulates the jet opening. The action is as follows: Opening the throttle causes a depression in the barrel or jet chamber and in the cylinder piston chamber. This causes the piston to be raised, more or less as the regulating needle is adjusted, and the air throttle is opened, at

the same time the jet orifice is increased by the lift of the needle. The whole action, therefore, is automatic, and the occasional regulation to suit climatic conditions may be made by the milled adjusting screw in the piston chamber.

So far this machine exists only on paper, but there are so many desirable features which will appeal to the majority of motor cyclists that we would welcome its realisation as a concrete fact.

Engine and Gear Box Lubrication.

Some Extracts from a Paper read before the I.A.E.

THE recent paper read by Capt. G. W. A. Brown before the Institution of Automobile Engineers, entitled "The Lubrication of Motor Cars," contains one or two points of interest to the motor cyclist. The first concerns the physical characteristics of engine lubricating oil, showing the effects of use in a petrol engine on its composition and properties. Capt. Brown said:

"It is usual practice in engine lubrication to fill the sump with a given quantity of oil, which remains in use up to two or three thousand miles' running. The longer the oil is used the thicker and darker it becomes, and, in order to ascertain the degree of deterioration caused by long periods of running, analyses were taken from—

"(a) A standard proprietary brand of lubricating oil.

"(b) The same oil after 100 hours' running in an aviation engine under full load.

"As a slight reduction is shown in the coefficient of friction, it is reasonable to suppose that this will continue to increase with the age of the oil. The original lubricating oil was of a yellow-green colour and free from sediment, whilst, after 100 hours' running, it became deep black. On examination, this oil was found to contain a considerable quantity of carbon specks or particles in suspension. These particles, magnified fifty diameters, gave a dimension of 0.001 mm., and were so fine as to pass all the usual methods of filtering. We were able, however, to separate the carbon specks by filtering through 3% fuller's earth, or with animal charcoal. The solid carbon particles so extracted amounted to 0.1%, carry-

ing also some traces of finely divided iron and copper. Samples of oil were tested on a Thurston machine, and the figures given prove the theory that the specific gravity is entirely independent of the viscosity, as, after use, the specific gravity has increased, while the viscosity has decreased."

Gear box lubricating methods were also criticised and suggestions made. The author went on to say that "A test of a gear box was undertaken by the National Physical Laboratory which gave the efficiency of the direct drive as being only 74% when the box was full of oil, while, when a quarter full, the value was 97.5%. It is evident that, had grease been the lubricant, the efficiency would have been lower still.

"A method of oiling the wheels of a gear box by making each dip into a trough in which oil is maintained at a constant level by a pump is suggested.

"It has always been the author's practice to put only sufficient oil in the gear boxes of racing cars to enable the teeth of the largest wheel alone to dip, but the best method would appear to be to cause a jet of oil to play upon the intersection of the gears on the side of engagement. In this design, white metal bearings are fitted for the shafts, and they are oiled under pressure; it is the author's experience that these are preferable to ball or roller bearings, making, as they do, a quieter and sweeter-running gear box, without diminishing efficiency. In any case, it seems an unnecessary refinement to fit ball bearings to a device which, as usually lubricated, is more fitted for determining the mechanical equivalent of heat than anything else."

CURRENT MATTER

Times to Light Lamps.

GREENWICH TIME.

Mar. 13th	...	6.28 p.m.
" 15th	...	6.31 "
" 17th	...	6.35 "
" 19th	...	6.38 "

New Registration Letters for London.

The London County Council has added LW to the seventeen other index marks now in use for automobile registration.

The M.C.C. Smoking Concert.

At this smoking concert, which is to be held at the Queen's Hall on March 21st, a collection will be made towards the funds of the St. Dunstan's Hostel for blinded soldiers. It is hoped that a substantial sum will be raised for this very worthy institution.

The Roads.

A recent memorandum by the Road Board to the Reconstruction Committee places, as a conservative estimate, the figure of £37,000,000, which must be expended at once on reconstruction of roads and bridges, apart from the question of deferred maintenance, which it is estimated will involve a similar outlay.

The Industrial Reconstruction Council.

The sixth lecture of the series arranged by the Industrial Reconstruction Council will be held in the Saddlers' Hall, Cheap-side, E.C.2, on Wednesday, March 19th. The chair will be taken at 4.30 by the Rt. Hon. the Lord Mayor of London, Sir Horace Marshall, LL.D., and a lecture, entitled "The Functions of Government in Relation to Education," will be delivered by the Rt. Hon. H. A. L. Fisher, M.P., President of the Board of Education. Applications for tickets should be made to the secretary, I.R.C., 2 and 4, Tudor Street, E.C.4.

Motor Cycle Design.

The paper on current motor cycle design by Mr. D. S. Heather, which was read before the Institution of Automobile Engineers, created a great deal of interest among motor cycle manufacturers. A good deal was said in the discussion to the effect that many of the points raised by the author had already received attention, but there appeared to be an admission that as manufacturers had found a ready market for the whole of their output they were disinclined to make drastic alterations. It is hoped that the makers and designers will take a stronger line in the discussion of the next paper, to be read at Birmingham on March 20th, which will deal with the design of the engine of the sidecar machine.

Special Spring Number on April 3rd.

Three weeks hence the annual spring number of *The Motor Cycle*—an issue keenly anticipated in pre-war days—will be published. Features of an attractive nature appealing to all tastes are in hand.

Looking Ahead.

There are makers who, at the present time, are making up the balance of their pre-war stock, proceeding with all speed on their real 1919 models, are experimenting with their 1920 machines, and have on paper the nucleus of their 1921 models.

Our Stocks of Petrol.

On February 24th it was reported that there were twenty million gallons of petrol imported solely by the Government, apart from aviation spirit and motor transport spirit. There are, moreover, additional stocks of petrol purchased by traders since the Government ceased to be the sole importers, so there is no question of shortage now. How much longer shall we be burdened with the Petrol Control Department, its wretched coupons, and the miserable super-tax?

Died on Service.

We regret to have to record the death of Mr. Ernest Parkes, son of Mr. Thomas Parkes, one of the directors of the Sun Cycle and Fittings Company, Ltd. Mr. Ernest Parkes was a member of the Birmingham M.C.C., and, prior to the war, took part in a considerable number of competitions.

Special Features.

1919 COMPETITIONS — OLYMPIA.

A FOUR-CYLINDER MOTOR CYCLE
BUILT BY ITS DESIGNER.
NOTES ON OBTAINING B.H.P.

U.S. Service Machines.

According to a Washington (D.C.) report, it is estimated that 34,800 motor cycles are used by the U.S. Army.

The Next Motor Show.

In connection with the November Motor Show at Olympia, the S.M.M.T. has decided that, whilst the Exhibition will be fully international, no goods of enemy origin will be allowed to be shown. This decision is comprehensive, and means not only that no German or Austrian cars will be allowed to be exhibited, but that no tyres, parts, accessories, or fittings of any kind, from enemy countries will be permitted.

A Motor Cycle Stolen.

Between 5.30 and 6.15 p.m. on Tuesday, the 4th inst., a 1919 8 h.p. Sunbeam combination, finished in black and gold, registered number AU 1773, the property of Dr. Davies, St. Thomas's Hospital, was stolen from outside the Hospital enclosure, in spite of the fact that the hospital porter had been asked to keep an eye on it. Any information with regard to this machine should be communicated to Dr. Davies, St. Thomas's Hospital, Albert Embankment, London, S.E.1.

AN OPPORTUNITY FOR MUNICIPAL AUTHORITIES.

8 h.p. Sunbeam ambulances from the French front to be offered for sale at Aldridge on the 19th inst.

A Scooter T.T.

Considering that there are only a few motor scooters in this country, *The Daily Mail's* announcement that a race for scooters is being arranged, appears to be rather absurd.

Calcium Carbide.

The Minister of Munitions has announced that the Calcium Carbide Order of 1917 has been suspended. It is, therefore, now permissible for traders to deal freely in carbide without a permit.

Ariel Prices.

At the moment of going to press, we are advised of an advance in Ariel prices over those shown in the "Buyers' Guide" this week. The $3\frac{1}{2}$ h.p. model is now £85, the sidecar outfit £115. The price of the 5.6 h.p. combination is £130.

A Motor Cyclist-car Designer.

The announcement of a new British sporting car to be designed by Captain W. O. Bentley, M.B.E., R.A.F., was made in last week's *Autocar*. Captain Bentley will be recalled as one of three brothers Bentley, all one-time enthusiastic motor cyclists, who occupied prominent positions in the competition world some years ago.

New Models in "The Motor Cycle."

Continuing our many first descriptions of new model motor cycles, we are this week able to introduce the new 3 h.p. A.B.C., a motor cycle, the advent of which has been eagerly awaited by thousands of riders. The designer, Mr. Granville E. Bradshaw, is also responsible for the Dragonfly aero engine, a radial type nine-cylinder engine, of over 300 h.p., one of the latest engines adopted for the British Air Service.

Where are the Motor Thieves?

A well-known Coventry motor cyclist, who is somewhat absent-minded, relates a surprising experience. Attending a meeting in Birmingham, he left his Powerplus propped up against the kerb, and forgot it. He returned to Coventry by train, and it was the next morning before he remembered his machine. Naturally he rushed back to Birmingham by the first available train. To his astonishment, the machine was precisely where he had left it.

The A.J.S.

Through a printer's error, an illustration of the 1919 A.J.S. given in last week's issue was described as a spring frame model. This is anticipating matters somewhat, but a 1920 spring frame A.J.S. is not improbable.

An Endrick Cycle Car.

A three-wheeler on novel lines will be put on the market shortly by the Endrick Engineering Co., formerly of Olton, Warwickshire, but now of Crawley, Sussex.

A Three Days Trial.

This year's "six" days reliability trials may whittle down to a three days event. It may prove the only really important competitive event in 1919, and it is expected that by early September manufacturers' post-war models will be ready for entry.

Annual Spring Number, April 3rd.

The Annual Spring Number of "THE MOTOR CYCLE," so appreciated before the war, will be revived on April 3rd. The issue for this date will be greatly enlarged, and will contain a number of special articles appealing to every motor cyclist.

Horse-power Rating.

In our leading article the recommendation is made that motor cycle engines be rated upon their capacity, 100 cubic centimetres to represent 1 h.p. The present nominal horse-power rating of engines is unsatisfactory, not to say confusing, to the novice.

Despatch Riders and their Mounts.

Maj.-Gen. Sir A. R. Crofton Atkins, K.C.B., C.M.G., Ministry of Supply, has replied to the letter sent by Mr. T. W. Loughborough, secretary of the Central Office Motor Cycle Reserve Committee. He says the suggestion put forward that "special provision should be made to enable the motor cycle despatch riders of any branch of the service to purchase, on demobilisation, the motor cycles they have been using on duty," will have sympathetic consideration.

THE DISPOSAL OF ARMY MOTOR CYCLES.

Two hundred motor cycles will be sold at the Royal Agricultural Hall, Islington, to-morrow, Friday; while five 8 h.p. Sunbeam ambulance sidecars will be offered at Aldridge's, St. Martin's Lane, on Wednesday, the 19th.

The Ministry of Munitions has now made considerable progress in connection with the arrangements for selling surplus war material.

Mr. F. G. Kellaway, M.P., chairman of the Surplus Government Property Disposal Board, has already prepared the general plan of action, and during the next few months the public will have exceptional opportunities for securing a great deal of useful material.

A Special Salvage Committee has been set up, which will deal particularly with the matter of the scientific utilisation of what might otherwise appear to be "scrap" of little or no value.

Many applications are being received from ex-service men who wish to obtain motor bicycles, etc. In this connection it must be pointed out that, except where material is put up to public auction, the Ministry will not be able to act as retailers to private individuals. It is hoped, however, that the various associations which exist, and which are looking after the interests of discharged men, will put themselves in communication with the Ministry.

Brig.-Gen. J. G. Weir, C.M.G.

A dinner was given on March 6th by the officers past and present of the Technical Department (Air Ministry) in honour of Brigadier-General J. G. Weir, C.M.G., who is retiring from the position of Controller of the Technical Department.

Imports and Exports.

The increase in the value of the imports in motor cycles (for the most part under special licence) for February over January is about 800%. The relative values for the three years are tabulated below, and show a distinct increase this year over 1918. As regards exports, the main tendency is to increase, as the value for February, 1919, is nearly three times that of the previous month, and shows an approximate increase of 50% over the figure for February last year. Progress is evidently in the right direction, and as many firms are rapidly getting into their stride we may expect continuous big increases throughout the year, dependent a great deal on the growth of home demand.

IMPORTS.

		1917	1918	1919
Motor	Cycles	..	£15,264	£10
Parts	£13,514	£5,663

Gear control side of the A.B.C. The integral engine-gear unit is completely guarded from mud by permanent shields of ample size. (For description see pages 242 to 244.)

A NEW FOUR-WHEELED RUNABOUT.

Enclosed Chain-cum-belt
Transmission—Variable
Pulley—Seat-starter.

IT is evident that there are many new and ingenious cycle cars coming to the front at the present time. One of these, here described, has been built by Messrs. Jones and Marchant, of 1, Baker Street, Weybridge. It is not yet on the market, but its designers and builders are open to receive offers for its manufacture from any firms capable of taking it up.

It possesses several notable features, including a rack and pinion starter, and a modified form of expanding pulley gear. The motive power is a 6-h.p. J.A.P. engine; the frame is of ash, and is suspended on four quarter elliptic springs. The drive is by chain to the countershaft, and thence to the rear axle by belt. On the countershaft is an expanding pulley actuated by two large face-cams, the shaft being mounted eccentrically on discs to which the cams are attached.

The Jones and Marchant cycle car.

By movement of the change-speed lever, the discs are rotated and the cams press against the sides of the pulley. This presses them inwards, thus raising the gear, the belt line remaining unaltered. Drawing the lever back enables the belt itself to expand the pulley, and so give a lower gear. Naturally the distance between the rear belt rim varies, but while an equal tension is preserved on the belt the tension on the driving chain is altered.

Expanding pulley mechanism.

To get over this difficulty an idler sprocket has been conveniently mounted on part of the mechanism, and is so arranged that it takes up the slackness in the chain as the gear lever is pushed forward. There is also a plate clutch carried on the engine shaft.

Other Details.

One of the accompanying illustrations gives a diagrammatic view of the gear, the idler sprocket, and also the rack and pinion kick starter which works admirably.

It will be seen from the semi-bird's-eye view of the vehicle that the engine and transmission are entirely enclosed. This view also shows the hammock seats, the petrol tank at the rear, and the handle for the rack and pinion starter.

The back axle is solid, no differential being fitted. The steering is ingenious, as the worm is carried inside the steering column and is adjustable.

It will also be noticed that there is a hand brake on the countershaft, while the rear brake is applied on to the V of the pulley, which is situated on the rear axle.

The car has proved itself to be excellently sprung, to have a good turn of speed, and, we are told, to be capable of climbing practically any hill.

Provided the belt and pulleys are of good size, there appears to be no reason why a reasonable measure of success may not be obtained.

Diagrammatic view of the gear.

Plan view of the cycle car, showing its boat-like outlines

ROAD CONTROL.

IN reply to the opposition and criticism being raised in the House of Commons to the new Transport Bill by members who consider that the development of roads will be prejudiced if they are placed under an authority influenced by railway interests, the Government reply is said to be to the effect that the control of roads will be a distinct branch of the Ministry, and no official partial to railways will intervene between it and the Minister. This "reply" has appeared in the daily press, and no reference is made to the fact that one of the chief objections to the proposed appointment of Sir Eric Geddes,

late manager of the North Eastern Railway, as the Minister of Ways and Communications.

"If a district needs opening up," runs a newspaper report, "this Minister will consult his different overseers and determine whether light railways, tramcars, or motor vehicle service is best. Having powers to run any of them, he may, for instance, say that motor omnibuses shall be put on a certain rural route, part of the necessary improvement of the roads being borne by the State, and if the subsequent traffic justifies it, he may institute a light railway. Such im-

partial decisions in the merits of each case would be impossible if roads and railways were under separate control."

Once more we would remind our readers of the fate of the canals after they came under the influence of railway interests. The opposition to the proposed Bill is not entirely confined to motoring interests, in which connection Mr. Bonar Law stated in the House last week that, in view of the many representations he had received, he had decided to postpone the taking of the Ways and Communications Bill until next Monday. It is said that Sir Edward Carson may lead the opposition.

CLUB NEWS.

Carlyle (Chelsea) M.C.C.

Mr. I. Lafferty, the secretary, informs us that some confusion apparently exists between the name of this club and that of a West-end institution of the same name. The name "Carlyle" is associated with the parish of Chelsea, and was adopted by this club in 1903.

Finsbury Park C. and M.C.

The opening meeting will take place on March 15th, when tea will be served at 5.30 p.m., followed by a lantern exhibition of club interest. Members and prospective members intending to be present are requested to notify the hon. secretary, Mr. J. Evans, 33, Springdale Road, N.16, whether they require a place reserved for tea or for the entertainment. The venue is the Red Lion Hotel, Barnet.

York and District M.C.

At the annual dinner and general meeting held on the 26th ult., the officials were elected and great enthusiasm manifested by members of the club. The opening run has been fixed for April 9th, to Farndale. Mr. C. S. Russell offered a gold medal or cup to be won by a non-trade member of either sex, who gains the highest number of marks during the year. Marks are allotted at the rate of one for attendance, one for punctuality, and one for cleanliness of machine. The hon. secretary is Mr. G. A. Reed, 6, Blake Street, York.

Future Events.

- Mar. 16.—N.M.C.F.U., Sheffield. Run to Blythe.
 Mar. 16.—N.M.C.F.U., Birmingham. Opening Run to Stonebridge.
 Mar. 23.—N.M.C.F.U., Sheffield. Run to Castleton.
 Mar. 30.—N.M.C.F.U., Sheffield. Run to Matlock.
 April 5.—Birmingham M.C.C. Opening Run.
 April 6.—The M.C.C. Opening Run to Hatfield.
 April 6.—Woolwich, Plumstead M.C. Non-stop Trial from Knockholt to Lamberhurst and Back.
 April 9.—York and District M.C. Opening Run to Farndale.
 April 13.—Liverpool M.C.C. Opening Run.
 April 18.—Darlington B and M.C. Opening Run.
 April 21.—Birmingham M.C.C. Easter Trials.
 April 21.—Dublin M.C.C. Dunlop Cup Trial.
 May 4.—N.M.C.F.U., Sheffield. Reliability Run to Knutsford.
 June 9.—Dublin M.C.C. Whit-Monday Trial.
 June (end of).—Dublin M.C.C. Twenty-four Hours' Reliability Trial.
 Aug. 2 and 4.—Dublin M.C.C. Trial.

Rochester, Chatham, and District M.C.C.

It is intended to hold a meeting, with the purpose of reforming this club, early in April. The hon. secretary is Surgeon Lt. S. White, R.N.V.R., 3, South Avenue, Rochester.

Club for Ryton and Blaydon (Durham).

It is proposed to form a club in the Ryton and Blaydon districts, and a meeting is to be held shortly with this object in view. The secretary *pro tem.* is Mr. A. Forster, 11, Ivy Avenue, Ryton-on-Tyne.

N.M.C.F.U. (Birmingham).

A run to Stonebridge has been fixed for the 16th inst., starting from the Swan Hotel, Yardley, at 11 a.m. On arrival at Stonebridge, the quarterly general meeting will be held, and the hon. secretary will give the General Council meeting report. The Summer Outings and Competitions Sub-committee will state its programme.

N.M.C.F.U. (Sheffield).

Additional runs to those already advertised have been arranged for March 23rd and 30th to Castleton and Matlock respectively. A reliability trial has been fixed for May 4th to Knutsford. Solo machines to average 20 m.p.h., and passenger machines 18 m.p.h. Mr. L. B. Henderson, A.M.I.A.E., has given a gold medal for the winner, and second and third prizes will be awarded. An additional prize for the best performance of lightweights will be given. The secretary is Mr. W. Wright, 48, Hinde Street, Firth Park, Sheffield.

We shall be pleased to hear again from secretaries and others regarding existing and proposed clubs, their programmes, and any other interesting particulars. We are prepared to assist with advice and publicity those desirous of establishing clubs.

In last week's issue we illustrated a motor cyclist's picnic party in the open during the first week-end of March. Sheffield riders, however, were not favoured with such mild weather. The riders depicted are members of the Sheffield N.M.C.F.U., who have learned that the motor cycle is not a machine for summer only.

The Eternal Question—What shall we Wear?

Further Notes on Attire for Feminine Motor Cyclists.

MISS GARDENER'S article on the question of clothing, which was published in our issue for February 6th, has evoked considerable interest among our lady readers. The number of letters we have received on this subject indicates that the motor cycle no longer is regarded by the fair sex simply as a vehicle of pleasure, and that many ladies are now using their machines throughout the year. This being so, the question of appropriate clothing is of greater importance to them than to those who merely ride for pleasure, as the latter, as a rule, are not all-weather motor cyclists.

The short contributions given below, from other lady motor cyclists, are selected from correspondence received since the article appeared.

Mrs. E. G. Cochrane, whose photograph we reproduce on this page, writes as follows:

"I was greatly interested in your article 'What shall we Wear?' by Miss E. M. Gardener, and, for the benefit of other lady motor cyclists, give my experiences with regard to the vexed question of clothing.

"For ordinary weather I wear a sporting Norfolk jacket, fitted with a fur collar, which is very serviceable when turned up for riding at night.

"After trying all sorts of queer outfits, in the hope that I might find something efficient, I have come to the conclusion that there is nothing to beat Bedford cord riding breeches for good hard wear, appearance, and comfort. Puttees are certainly clumsy and difficult, nay, almost impossible, for a lady to put on properly, and so I have discarded them, substituting instead a pair of warm cycling stockings, worn over ordinary thick ones. In wet weather I wear a long mackintosh waterproof overall over the Norfolk coat, and also top boots, which seem rather heavy, but are really necessary. For ordinary weather I find thick golf shoes sufficient.

"My cap is made after the fashion of the R.A.F. lady-drivers hat, and is kept in position by pressure from the goggles. A pair of fur-lined gauntlet gloves completes the costume for riding; these latter I have found absolutely essential. One gets chilled to the bone through wind rushing up one's sleeves when wearing ordinary gloves.

"I always carry with me a short skirt, buttoning up in front and at the back, which I slip on for walking on arrival at my destination. The whole costume, with the exception of the breeches and overall, is made of shower-proof material, and is sufficient to keep out ordinary rain, it being only necessary to wear the waterproof during a really heavy downpour.

"I have used this costume on all occasions for a couple of years, and it gives every satisfaction. During very cold weather, I wear underneath the costume, in addition to ordinary clothing, a Cardigan jacket, and also a woollen scarf."

A second letter is from a lady who gave up motor cycling on account of the difficulties of dressing neatly:

"Although Miss Gardener seems to have gone a long way to solve the problem of 'What shall we Wear?' there is still room for some hard-thinking tailor to introduce a

A serviceable costume worn by Mrs. E. G. Cochrane. The skirt can be quickly removed for riding.

costume that shall be complete in itself, and not an adaptation of various garments in which one is ashamed to be seen with or without one's machine.

"I gave up motor cycling for this very reason. I rode only in the summer, but, notwithstanding, I shrank from the attention I attracted when off the saddle. For the present, I am content to be a sidecar passenger until (1) a suitable costume is offered to lady motor cyclists, and (2) a motor cycle is designed that shall protect the rider from mud. With the help of *The Motor Cycle*, both these things will eventuate."

"M.D.," a Surrey school girl, gives her experiences in the following entertaining letter:

"I was very interested in the article in your pages on 'What shall we Wear?' I

have found this a difficult problem, and have not really solved it. Being a somewhat youthful rider (I got my machine for my fourteenth birthday two years ago), I do not, of course, wear terribly long skirts.

"I use the bicycle to convey me to the station every morning, as I go to school by train, so, of course, I have to wear my ordinary school clothes and cannot—like Miss Gardener—wear breeches, etc.

"I find it quite easy to ride in a skirt, and see no reason why any lady should not, unless, of course, she wears a narrow one. When I leave home, I generally wear a tweed costume, school regulation navy blue felt hat, a tweed overcoat, and over this an old showerproof coat—very oily and muddy—which I discard at the station.

"I had difficulty with footwear, however, as I could not arrive in town (where the streets were almost dry) splashed up to my knees in mud, but this was solved by a friend, who kindly gave me a pair of field boots, which I change at the station.

"Like Miss Gardener, I also experience difficulty with headgear, and generally arrive at the station with my hat clenched between my teeth (I am afraid this accounts for the colds I get, especially in wet weather). Behold me, then, a flying female figure, hat between teeth (it's nasty when the dye runs), a khaki coat, and trench boots, hastening to the station at the last possible minute. I run the bicycle into the shed and emerge with navy blue hat, costume, and spotlessly clean shoes (I carry my shoes tied to the belt of my coat).

"I wish somebody would send a few suggestions for one who has to arrive at school respectably clad, and as if she had never seen a motor bicycle or muddy road in her life.

"At first I found I was always getting my coat caught in the kick starter, but have solved that by having the offending mechanism removed. I was taught to take a running start—the clutch would not work, so the starter was never of much service.

"I should be so glad if any reader could give me any advice on this subject of dress, as it will be seen from the above I must look like nothing on earth.

"About gloves, thanks to an airman, I find that silk gloves worn inside gauntlets are the best."

Doubtless there are many other members of the fair sex who have had some experience in these matters of which they would not object to give others the benefit. Particularly must this be the case among members and ex-members of the Forces who have had much riding to do in all kinds of weather.

A Four-cylinder Mount built by its Designer.

An Engine with Overhead Valves, Camshafts, and Other Unique Features.

The four-cylinder motor cycle is rapidly growing in favour. As a high-powered machine for all purposes it is eminently suitable. We give below particulars of a machine built to the designer's own ideals, many of which will doubtless find echo in the mind of the enthusiastic amateur. Incidentally, it is not proposed to put this machine on the market.

WE recently had the pleasure of inspecting a machine of promising design, built by Mr. R. G. Baird, Nottingham, solely for his own use. This machine embodies, among other features, a four-cylinder engine of 750 c.c. capacity with overhead camshafts. Nothing has been scamped, and every detail most carefully thought out, and equally well executed.

The frame is of substantial design, with extra heavy Brampton Biflex spring forks and quarter-elliptic leaf springing at the rear. As will be seen from the illustration, the rear springing is very neat, the springs being bolted to a bracket below the saddle, the thin ends of the springs sliding between rollers secured to the triangular support which carries the rear spindle. The pivoting spindle is of specially stout dimensions, and supplied with a lubricator feeding the oil into grooves. The construction should be capable of resisting a great deal of side stress—the weak point of many spring frame machines.

General Design.

A duplex tubular cradle carries the engine, and the whole can be dropped out of the frame by undoing four bolts. The only weak point of this construction appears to be in the use of right-angled and T lugs, which take the weight of the engine. The straight top tube slopes up to the steering head, which is of ample size to take upper and lower Timken taper roller bearings on which the steering fork works.

A neat-looking tank is used for petrol only, and will hold two and three-quarter gallons. Attached to the off side of it is the change speed quadrant, as

shown. The mudguards are exceptionally wide, and the front one is provided with a valance. The rear guard is secured to the heavy gauge carrier, and moves up and down with the wheel, maintaining 1½ in. clearance. The wheels are con-

structed with voiturette rims to take 700×85 mm. tyres. The wheel hubs run on Skefko ball bearings, and the rear wheel, in addition, has a double-thrust ball bearing. Adequate lubrication of these parts is ensured by the provision of large grease caps on the hubs, the grease serving largely to exclude mud. 9 in. brake drums for the internal expanding brakes are attached to the spokes, the rear brake being worked by pedal and the front by a Bowden control. The wheelbase is 63 in., the ground clearance 3½ in., and the saddle height 32 in. when the machine is unloaded.

There are many features in the engine construction worthy of note, and no pains have been spared to make the transmission silent, efficient, and lasting.

The Engine.

The cylinders are of 55 and 80 mm. bore and stroke respectively, giving a total capacity of 760 c.c. The lower end of each is spigoted into the crank case, and held down by four studs in the usual manner. Two openings at 60° are provided in the combustion head to receive the valve cages. Another hole is tapped to take the sparking plug, also at an angle. Lugs are provided at the tops of the cylinders for attachment of the camshaft case supporting bolts.

Special high tensile nickel-chrome steel is used for the valves, which have a split cone spring-plate retaining arrangement approximating to aero engine practice. The effective valve diameter is 25 mm., and the lift 8 mm. Width of the seat is 2 mm. at an angle of 30°. The stem is 7.14 mm. thick, and undercut to take the cone cotter. The valve cage is made of cast iron, with ports in the sides to

Section of the engine, showing the method of operating the valves.

A Four-cylinder Mount built by its Designer.—

The extremely neat clutch withdrawal mechanism operating through helices.

correspond with the inlets or exhaust pipe outlets as the case may be; the whole is retained by a gastight sleeve nut. The valves are operated by two overhead camshafts, which are driven by spiral gears from the half-time shaft. This construction disposes of the necessity for rockers and pivots, the cams acting directly on square-section adjustable tappets, which in turn bear on the valve stems.

The valve timing is as follows: Inlet valve opens 10° late and closes 45° late; exhaust valve opens 46° early and closes 6° late.

Each camshaft is an alloy steel rod, on which are tightly fitted the separate cams, which are pinned through and separated by tubular distance pieces. The shafts are hollow, running on ball bearings, and forming ducts, into which oil is pumped by the main gear-type oil pump, the oil escaping through small holes drilled from the cam faces through to the duct. The surplus oil flows into the camshaft case and returns to the sump by way of spiral grooves cut in the vertical shafts, which, while rotating, have a slight pumping effect. The flow of oil into the camshaft can be regulated by a threaded piece on the end of the casing where the oil pipe is connected.

Forced Lubrication.

The pistons are of "point five" carbon steel turned from the bar, with flat heads and only two rings. No strengthening ribs were considered necessary, and the weight consequently was kept low.

Tubular connecting rods are used, and serve as oil ducts to the gudgeon pins, which have phosphor-bronze bearings, the big end bearings being of white metal without the usual brass shell.

A substantial five-bearing crankshaft is employed, drilled throughout for forced lubrication to all bearings. The main bearings are plain white metal in aluminium housings attached to the upper half of the crank case in car engine fashion. A flange is turned on the rear end, which is drilled and tapped to take the shanks of the countersunk set pins, which hold the flywheel to the crankshaft. No balance weights are fitted to the crank webs. The oil is fed to the crankshaft bearings from a pipe with branches to each of the main bearings. In order to obtain the offset or *désaxé* effect, the shaft is set 10 mm. off centre, i.e., one-eighth the stroke to one side.

The crank case follows car practice, in that it is divided horizontally, but there is no tray for splash lubrication, and a deep sump is provided below the big ends, in which the whole oil supply, amounting

to three-quarters of a gallon, is stored. One wall of the upper half of the case embodies the oil lead to the main bearings, and baffles cover the cylinder openings, just leaving room for the connecting rods to oscillate. A large sized combined oiler and breather is provided with a special oil retaining cap. Attached to the forward end of the lower half of the crank case is the gear-type oil pump, leading from which are the two supply pipes to the crankshaft and camshaft respectively.

Bolted to a plate over the gear box is the magneto, which is driven by enclosed roller chain from the off side camshaft, and attention to detail is shown by the fact that the shaft spindle on the chain cover carrying the half coupling is on ball bearings so that no strain is put on the magneto shaft bearings. As the magneto is of a type that is liable to lose magnetism through its shaft, half the coupling is made of brass. The coupling consists of two discs, one with sixteen and the other with seventeen holes to take the coupling bolts, so that very fine ignition timing adjustments can be made.

The Plate Clutch.

A Claudel-Hobson carburetter is used, and the induction pipe takes the form of a double O to prevent surging and rebound of the gases at high speeds.

The flywheel is turned from the solid, and incorporates a Ferodo-lined flat plate clutch. The plate has a central boss, which is broached to slide on four keys arranged around the mainshaft, and six helical springs hold a circular plate member (faced with a ring of Ferodo fabric) against it, and so press it against a further fabric ring attached to a circular cover plate on the other side. The clutch release mechanism consists of six levers pivoted on bosses attached to the cover plate, provided with adjusting screws, which bear on studs through the inner lined plate. The operating mechanism is attached to the forward end of

the gear box, and works through a four-start quick-thread in a boss on the lever end. The pressure is taken by ball thrust bearings, so that a minimum of effort is required to withdraw the clutch. The whole assembly (minus flywheel) only weighs $3\frac{1}{4}$ lb. The gear box is a three-speed, six-wheel type, sliding gear arrangement, operated through forks which move along rods inside the box. As the shaft drive has to be taken to

(Left) The substantial construction of the rear ball bearing universal joint is shown by this section.

(Right) The easily detachable valve and cage assembly which facilitates inspection of the valves.

one side, the direct drive is through the secondary-shaft, with equal-sized gears, the reduction of 4.6 to 1 being obtained through the worm gearing. Both shafts are on ball bearings, with washers and pads to prevent oil leakage. The other two ratios are 6.44 to 1 and 11.6 to 1. This unit weighs $22\frac{1}{2}$ lb.

Immediately behind is the sliding universal joint, and another joint connects the cardan-shaft to the worm gear, which consists of a four-start straight type steel worm, polished on the thread and supported on ball bearings each side, and having thrust bearings to take the end pressure. The worm wheel is of phosphor-bronze, and the whole is enclosed in an oiltight casing. The side thrust due to the worm is taken in the rear wheel by double thrust ball races.

Induction side of the Baird four-cylinder power unit.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Herford Street, Coventry, and must be accompanied by the writer's name and address.

MOTOR CYCLES FOR THE MAIMED.

Sir,—In reply to Devereuse H. Whyte's enquiry, the 3½ h.p. Sunbeam has no right foot controls. All controls, including clutch, are on the handle-bar, and the foot brake is operated by the left foot. WALTER D. MALLET.

THE THREE-JET BINKS CARBURETTER

Sir,—With reference to the discussion in your paper upon the "dead spot" in the Binks three-jet carburetter, I should like to state that I found a remedy for this by slightly chamfering the upper edge of the air-hole for the second jet on the side nearer to the engine.

The "dead spot" was only between the first and second jets, the opening on to the main jet being perfectly smooth.

Hoping this may assist other users of this fine instrument, Sheerness. H.C.

THE MOTOR CYCLISTS' PARLIAMENT.

Sir,—Such a spirited appeal as Maj. Axford's should surely arouse the rank and file of motor cyclists to take an interest in the A.C.U. and their own welfare.

There certainly is a vagueness in the minds of many motor cyclists as to the vocation of the A.C.U., but surely it is clear to every thinking motor cyclist that a body really representative of his fraternity and working for its best interests is vitally necessary. Organisation is essential in these times; the last four years have demonstrated that, however worthy a purpose, unity of action is vital to its accomplishment. There will undoubtedly be an aftermath of the war in the form of legislative restriction, road problems, and similar handicaps to motor cycling. As there is obviously no possibility of the motor cyclist overcoming these in his individual capacity, one would think that the average rider would be concerned enough to find out what the A.C.U. is, and then accord it his support.

The details of the constitution of the A.C.U. quoted by your contributor should convince motor cyclists that the management of the Union is established on about as sound lines as it could be.

Major Axford's remarks regarding committee nominations are particularly interesting. The fact that the management and financial control of the A.C.U. is vested solely in the committee makes the question as to who shall serve thereon one of vital importance. The committee, indeed, practically constitutes the motor cyclists' parliament, and as such its *personnel* is a matter of concern to every rider. One can hardly exaggerate the desirability of having a committee of real motor cyclists of fighting temperament.

There is no lack of thoroughly practical and representative motor cyclists at the present day. As a body no section of the people did better service in the war than motor cyclists. Among those who bore a strenuous part in the conflict, in khaki or out of it, are many who have learnt the requirements of motor cyclists from A to Z; and their experiences with motor cycles under all conditions qualify them to speak and act for the best interests of the fraternity. It is men of this type whom we want on the A.C.U. committee—experienced, clear-headed, aggressive counsellors, who will give qualified, consistent, and disinterested service for the safeguarding and advancement of motor cycling interests.

The trouble is, I am afraid, that the average clubman has not the qualification for determining who is really a representative man to send to the A.C.U. committee. The danger Major Axford speaks of regarding the man whose only qualification is a genial personality is very prevalent in this connection. Geniality is a most acceptable charac-

teristic in these days, but it is quite a mistake for local clubmen to nominate a representative to the A.C.U. just because he is a good fellow.

We all hope after the stress of the past few years for an era of motor cycling that will in some degree compensate for our endurance. But everything will not be plain sailing in the immediate future, and it certainly behoves every animated motor cyclist to find out what the A.C.U. is doing, to give it what support he can, and to use any influence he may possess to ensure that right men constitute its committee—the motor cyclists' parliament.

OSCAR C. SEYD.

THE A.C.U. COMMITTEE.

Sir,—Maj. Axford's article in the last issue of *The Motor Cycle* was extremely interesting, but I imagine the club—and individual members, too—are still in the dark as regards the names of the "fighters" they should nominate for election.

My knowledge of the men who have controlled the policy of the A.C.U. in the past, and my faith in the future of the Union, leads me to suggest certain names as those of men likely to help forward actively the fighting programme that we must get the Union to carry out. In the past, certain men have represented both the club and the private members, which means that they have robbed one or the other of their allotted representation. I have not been able to complete my list of club nominees, but so long as the club do not, when filling up the gaps, nominate the candidates I have suggested as representing the private members on the R.A.C. this mistake can be avoided.

Suggested Club Nominations.	Suggested Candidates to represent Individual Members.	Suggested R.A.C. Nominees.

E. B. WARE.

[It will be generally agreed that only energetic workers be nominated on the A.C.U. committees. Mr. Ware's lists contain the names of many such enthusiasts, in every way qualified to represent riders in the motor cyclists' parliament; but if we may offer comment, the addition of a stronger representation from the provinces (Birmingham, Manchester, Sheffield, Bristol, North of England, etc.) is necessary. In the past too many provincial motor cyclists have regarded the A.C.U. more or less as a London institution—an impression which that body must remove entirely if the support of the majority of motor cyclists is to be secured. We fear that Mr. Ware's suggested representatives, if elected, would not entirely remove that impression.—ED.]

TO KEEP THE HANDS WARM.

Sir,—My riding has been like that of your correspondent, Miss Gardener, in that at certain times I have had a journey to do, no matter what the weather, and although the ride has not been for many miles during the war, and never for joy-rides, I have suffered much from cold hands until this winter. I had presented to me a pair of gloves made of kid, the outside of the fingers and backs of the hands covered with lamb skin with the wool on. There is a good gauntlet over the sleeve. When the handles of the machine are grasped, only the wool is exposed to the weather. I had a drive recently in 20° of frost, yet my hands were quite warm. A soldier on leave carefully examined my gloves, and he has "bnilt" a pair. He had some thick kid gloves as foundation, and two dressed hare skins. He has covered them on the backs and made some gauntlets. They are as good as mine for warmth and keeping out the rain and snow. Personally, I consider them ideal.

W. J. BELDERSON.

ADVANTAGES OF A TWO-STROKE.

Sir,—As a constant reader of your interesting paper, may I say that I was amazed by Mr. F. W. Varney's statements in your issue of February 6th re his 2½ h.p. Levis? While readily admitting that the Levis is an exceptionally powerful machine, I must say that I think Mr. Varney must have his tongue in his cheek, when he states that his machine is capable of taking three passengers in a coach-built sidecar up the "dreaded hills," Sir William, Mam Tor, etc. Surely if these statements were justified fully by performance, Messrs. Butterfields would announce them in their advertisements? May I add that I should be interested to hear more from Mr. Varney about this truly remarkable machine?

C. W. ORFORD.

Sir,—Having only recently landed in England from Macedonia, and not having had the pleasure of seeing *The Motor Cycle* lately, I have missed your correspondent's (Mr. Varney's) remarks about his admirable 2½ h.p. Levis. It must be a wonderful machine if it can do all that is reported in the letters of other correspondents in the issue for February 20th.

Mr. A. A. Smith and his Regal two-stroke.

In reply to "Enquirer," I have pleasure in telling him that he need have no anxiety about the power of a 2½ h.p. two-stroke engine for sidecar work; and as a satisfied owner of a Regal-Peco combination, plus a Sturmey-Archer three-speed hub, I have yet to meet the hill I cannot climb with at least two passengers. I have driven from Birmingham to the Isle of Wight and back with three up (about 28 stone), and averaged fifty miles to the gallon on that tour, which speaks well for economy. I average 80 m.p.g. solo.

I can safely say the Peco is a no-trouble engine, and after 5,000 miles it shows no sign of wear or loss of power—no doubt due to the excellent oiling system (drip feed) employed.

I would urge "Enquirer" to see to it that he gets a full 2½ h.p. unit, i.e., 75×79 mm. bore and stroke, 349 c.c., and be satisfied with *nothing less*. Not being a speed merchant, he will, I feel sure, be well content, although, riding solo, he could obtain anything up to 40 m.p.h., should the fit take him. Most of my riding has been with sidecar and passenger.

I have pleasure in enclosing a photograph of myself and trusty friend.

A. A. SMITH.

IS A T.T. RACE POSSIBLE?

Sir,—Surely, seeing that the Isle of Man people are anxious to have races in the Island this year, a motor bicycle race at any rate can be held, provided the A.C.U. or other suitable body will undertake the organisation.

The fact that the trade is unable to participate is no reason why the race should not be held. I am quite certain that if you asked in your paper for the names of amateurs willing to enter, provided the entrance fee did not exceed, say, £5, you would get a large number.

If Senior and Junior races were arranged on the lines of the 1914 races, I imagine you would easily get one hundred or more entries, and a sufficient sum would thus be raised to enable the races to pay expenses, and very probably a little bit over.

Of course, with no trade support the races would have to be run on a far less elaborate scale than in 1914, but, provided the safety of competitors and public is assured by necessary barriers and flagging, etc., we should have to get along without elaborate stands, filling-up depots, etc.

As regards machines, there will by June or thereabouts be a fairly wide choice of both 500 c.c. and 350 c.c. makes available; makers' standard or amateur faking only permitted.

Without the crack trade riders and tuners and factory assistance, average speeds would be a little below 1914, but a good sporting race should result.

From a racing point of view the course was always rough, and if it is a little rougher still this year I fail to see that it matters. All the better test for man and bicycle.

There are plenty of sportsmen in Britain, both would-be riders and spectators, so why not test the possibilities at any rate a little later on when more of the boys are back?

VIVIAN OLSSON.

REAR LIGHTS ON CYCLES.

Sir,—Signatures to a petition against the compulsory rear lighting of cycles are being canvassed for in this district (Stafford), where many hundreds of cycles are in daily use.

On questioning two or three of the more responsible signatories they gave me as their reason for signing this petition that they "find the rear light a nuisance to fiddle with and keep alight; that's all."

Do these people realise how often the little red glow has saved a life, to say nothing about the comfort it has given to the drivers of fast moving traffic? If so, what can they care for the safety and comfort of the majority of road users?

This red light has shown out of the gloom ahead when vision has been temporarily "blurred" by on-coming head lights, and has prevented on many occasions a smash on overtaking a cycle user. This is a real danger; how very real can only be judged by a motorist.

I cycle daily (being three miles away from my business), and, whatever the law may be, none of the five cycles in my household will be used after dark without a rear light, as my greatest "shocks" on the road have been caused by rear lightless cycles.

If successful, these petitioners would force on to the road thousands of glaring seachlights—the motorist's safeguard—a nuisance in traffic as much to those who would thus be compelled to use them as to the general public, particularly cyclists; and, of course, other slow moving traffic would follow up with more petitions.

Where, sir, should we eventually retrograde to?

I maintain the conditions of war did none other than accentuate the necessity for the law as to rear lights, and it would be a homicidal Act which would repeal it.

I have been a cyclist for thirty-five years, a motor cyclist (about 17,000 miles) for eight years (without accident), and a special constable for over four years, so I think my experience and opinion are not unworthy of record.

Please peg away for sound judgment to prevail in this matter.

W. J. SHEPHERD.

RUSTLESS STEEL FOR MOTOR CYCLES.

Sir,—Referring to Mr. Walford's letter in your issue of Feb. 20th, may I point out that the comparison drawn by him between Stainless steel and B.N.D. is somewhat analogous to the expression of an opinion that a piece of coal is larger than a brown paper parcel. Both these steels can, in one condition of heat treatment, give lower tensile strengths than 40 tons, if desired, just as they can both be treated to give over 90 tons tensile.

After all, however, other factors are of more importance than maximum stress, from the motor manufacturers' point of view, and the general mechanical properties of Stainless make it a valuable material for many applications, apart even from those where its freedom from corrosion renders its adoption almost indispensable.

The fact that Stainless steel has very largely replaced tungsten steel in the valves of aero engines, where efficiency alone is the deciding factor, is definite proof of its superiority as a valve steel for high duty internal combustion engines.

THOS. FIRTH AND SONS, LTD.,

R. B. BILLINGHURST.

ELECTRIC LIGHTING BY BATTERIES.

Sir,—In a recent issue of *The Motor Cycle* appears a letter from "Practical Engineer" regarding battery lighting, which I cannot pass unanswered.

"Practical Engineer's" criticisms are not borne out by fact. It may interest him to hear that 4 volt Hellesen dry cells have been used in connection with certain instruments used for war purposes, and although the work put on them has been far greater than a bell circuit would do, they have stood up to this work for more than three years, and then have been used for bell ringing, and, to the best of my knowledge, are still in use.

A few years back I installed a complete set of Messrs. Hunt and Co.'s electric lamps and Hellesen batteries on my motor cycle, using bulbs of the following candle-power: head lamp 3; tail lamp 1.5. My average period of night riding was four to five hours per week, generally using my lamps for about one hour and a half at a stretch. With this use the Hellesen cell lasted nearly fifteen months, and was then put into use for bell ringing and other purposes.

As for "Practical Engineer's" statement that dry batteries are generally used to supply a current measured in milliamperes, I should not care to have my mill-ampère meter placed in most circuits where dry batteries are used.

In conclusion, I can strongly recommend dry batteries for lighting on a motor cycle when the lamps are only used at intermittent times, and for, say, not longer than one hour and a half at a stretch. Then if a bulb consuming about .6 or .8 ampère is used in the head lamp and the smallest lamp obtainable for the voltage (4 or 6 volts), a satisfactory lighting system will be obtained. I have no interest in Messrs. Hunt and Co. C. R. RUSSELL, A.A.I.E.E.

PULLEY GRIP.

Sir,—The article in your issue of Feb. 20th on the new Grado pulley draws my attention to a point that I have often wondered about. You say "The outer flange continuously tends to close in on to the inner flange, thus gripping the belt in whichever position it may be." Does it? You then proceed, "If the controlling mechanism is freed, the pulley will gradually close. . . ." That is the point. It is obvious that the whole pressure generated by the tendency of the flange to move inwards is exerted against the control rod, and not on the belt. Look at it another way: in the case of a pulley with fixed flanges, the pressure at any moment between the belt and the flanges depends on (1) the turning effort of the pulley at the moment and (2) the initial tension of the belt (assuming the usual angles for belt and flanges, 28°, I believe). That is, the pressure of the belt against the pulley equals the pressure of the pulley against the belt. If the latter alone were to increase, the belt would have to rise in the pulley until the balance of pressures was restored again. Therefore, it seems to me that we cannot increase the "grip" (i.e. pressure) of the flange on the belt without causing the belt to rise: this does not happen on the Grado as the flange is prevented from moving by the control rod. The only means of increasing the pressure between the belt on the flanges is to increase the turning effort of the pulley or the initial tension of the belt.

If my reasoning is faulty, perhaps some "high brow" in statics will correct me. I may say I have used a Grado pulley for a considerable period, and I find my theory borne out in practice. If a belt is in good condition it grips when slack on a Grado, but the same belt grips equally well when slack on a fixed pulley. When the belt is hard or glazed (whether leather or rubber), it is the very devil on either pulley. Hoping you can find room for this, and congratulating you on the continued excellence of *The Motor Cycle* (I have read it for twelve years).

GRADUATE.

STEAM MOTOR CYCLES.

Sir,—May I be allowed to trespass on your space to answer the queries of "Slide Valve," Western N.Y., U.S.A.?

My address is St. James, Stratford-on-Avon. I should be very pleased to accept his offer of advice and literature on the subject of steam cars.

"Slide Valve" questions my sanity in placing the engine in the rear of the cycle car. It is not so inaccessible as he imagines. I think he was confused over the word "housing"—"bedding" would have been a better word. The engine could be "bedded" on, not in the rear of the chassis, and be covered with a dustproof bonnet. With the engine at the rear a short chain drive could be employed, as in the Carden cycle car.

Transmission could not be simpler. I should strongly advise those who intend making a steam cycle car to construct the complete chassis, etc., themselves, but purchase the power plant from such factories that make a speciality of small steam units. It does not pay for the average man to experiment in these plants.

Finally, if the steam plant is placed in the rear the safety factor is increased, because a hefty boiler plate could be placed at the back of the driver's seat, so that if anything did go "bust" it would not "bust" the occupants of the car, who would be protected by the boiler plate.

(REV.) T. BAYDEN SINGLETON, B.A.

THE CONTROL OF AEROPLANE ENGINES.

Sir,—I quite agree with Mr. Butt that it is difficult to generalise about aero engines, but this is almost the only accurate statement in his letter.

As to oil pressure building up to excess on the high-pressure system of a cold engine, I will quote from some notes circulated to units in the field by the G.O.C.:

"If the engine is opened out while cold, the pressure set up will be enormous, and will probably cause serious damage. The correct pressure, i.e., for a specified engine, is 45 lb. per square inch: when the engine is cold, the pressure will naturally be much higher."

Mr. Butt has possibly never seen oil systems warmed by conduction during engine stoppages, because his experience has been subsequent to the use of heating devices which obviated this nuisance. Nevertheless, the Allied Governments and contractors issued urgent instructions for this method to be adopted as late as the winter of 1917.

It is true that every engine has its own variations of r.p.m. It is also true that, given a suitable propeller and a properly maintained engine, each engine has a maximum speed, above which it cannot safely be run *continuously*, and a higher maximum which is just safe in a brief spurt. Many engines are wrecked because their pilots regard these specified maxima as mere hot air.

These and other matters were necessarily handled sketchily, owing to limits of space. TORQUE.

BOOKS FOR MOTOR CYCLISTS

MOTOR CYCLES AND HOW TO MANAGE THEM.

The recognised standard text book of the motor cycle: deals with all types of machines and with every part of the machine. 400 illustrations. Price 2/6 net. By post, 2/10.

HINTS AND TIPS FOR MOTOR CYCLISTS.

A valuable collection of useful "wrinkles" and items of information concerning the running, management, and repair of motor cycles. Price 2/- net. By post, 2/3.

TRACING TROUBLES.

Motor Cycle Faults, Their Identification, and Their Remedies Fully Explained. Price 2/- net. By post, 2/2.

Obtainable by post (remittance with order) from

ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4
or of leading Booksellers and Railway Bookstalls.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Pre-ignition.

? My two-stroke is not running so well as it used to do. It starts away all right, but after a few miles it suddenly stops firing, then, just as the machine is coming to a standstill, the engine fires for a few yards and repeats the performance. The trouble is less pronounced on low gear than on high. I have cleaned the carburetter, jet, and plugs, but can effect no improvement. —A.J.

The trouble is probably due to the plug, and we should recommend you to try changing it. Possibly an improvement might be effected by using a smaller jet. We presume that you have seen that the magneto is in order.

A Worn Tappet Guide

? I have lately purchased a 2½ h.p. Brown motor cycle, and should be glad if you could help me (1.) When the back wheel is turned the exhaust valve tappet makes a clanking noise, and can be rocked from side to side. Is this as it should be? (2.) I had the machine running the other day and volumes of smoke came from the exhaust pipe and the carburetter joint. When the engine was accelerated it gave several jerks before it settled down and slowly accelerated. (3.) When I removed the sparking plug it was sooted up. (4.) I have great difficulty in starting, although there is plenty of petrol reaching the engine. Once the engine is warm, however, it starts easily enough, but takes time to get going. (5.) The machine is fitted with a long exhaust pipe but has no silencer. Is this correct? (6.) What is the age at which a driving licence can be obtained? (7.) Can I get the machine registered for a number without having a licence? —J.M.

(1.) Evidently, the exhaust valve tappet is worn or the bearing needs rebushing. (2.) The difficulty here is too much oil. (3.) The trouble is due to bad petrol. (4.) A long exhaust pipe is satisfactory provided the machine is reasonably quiet. If, however, it is noisy there should be an expansion chamber fitted as close to the exhaust outlet as possible. (5.) Fourteen years of age. (6.) This question is not clear; but if you are asking if you may register a machine for which you hold no registration or no driving licence the answer is in the affirmative, but as soon as the machine is registered you will be asked for a local taxation licence, which must be taken within twenty-one days of your ownership of the machine.

Rocker Spring.

? There is a long spring and a short one on the contact breaker of my magneto, and the short one is broken. I am told it makes no difference. Why should a spring be put on if it is no use? —J.W.

The spring to which you refer merely prevents the contact breaker rocker from coming off its pivot, and does not affect the working electrically.

Loss of Power.

? I have a 1912 Triumph, which ran well until the end of last summer, when it would only run a mile or so, and then gradually lost power and petered out. I had the cylinder reground, new piston, gudgeon pin, rings, and crank case bearings, also connecting rod ends rebushed, and the magneto repaired. Compression is good, carburetter acts well—in fact, everything so far as I can see is in good order, but still the engine has no kick in it. It has always thrown oil about a great deal, especially between the pulley and the crank case, and although supposed to have had new bearings fitted, is just as bad. (1.) What is wrong with the engine? (2.) How can I remedy the slinging about of oil? —G.H.A.

(1.) If you have satisfied yourself that there is a good spark, that the carburetter is working properly, and that there is good compression, there can only be one other solution, and that is that the

timing of either the valves or spark is wrong. We are inclined to think that the pinion on the engine-shaft has worked round and thrown the timing out. You should check the valve timing for this, and afterwards the ignition. (2.) If the rebushing of the bearing is ineffectual in retaining the oil you will have to have a felt washer fitted inside the crank case, but first of all make sure that the crank case air release is quite clear and working properly.

Fuel Mixtures

? (1.) Please tell me if the mixing of one pint of methylated spirits and one gallon of petrol with a two-gallon tin of paraffin, making 3 gallons 1 pint of fuel, would be a suitable mixture for sidcar work. (2.) Will this fuel injure the bearings or cause pre-ignition on a 1914 Indian? (3.) Is methylated spirit suitable for a motor cycle? —A.N.P.

(1.) The mixture, if you leave out the methylated spirits, would be satisfactory, but not so good as petrol or benzole. The machine would probably not start on this mixture, and you would require a hot air intake to be fitted. It might also necessitate the engine being started on pure petrol. (2.) The fuel would not injure the bearings, but would not be so clear running as petrol, would probably cause more carbon deposit, and a greater tendency to knock. (3.) Methylated spirits (or alcohol alone) are not suitable for use in an engine not specially designed for the purpose.

One of the repair shops for British Army motor cycles in Italy. The work of clearing up is gradually being effected on this front, and a few of the workshops have already been dismantled

Sidecar Brake.

? Is it practicable to attach a brake to a sidecar wheel, and what type would be most suitable?—W.H.L.

A sidecar brake is not advisable, unless it can be compensated so as to act together with the machine brake, and this is a difficult proposition. If you have a good front brake of a band or B.S.A. type, that should be sufficient in conjunction with the rear brake. A lever-controlled brake with retaining notches is highly desirable on the heavy outfits.

Protecting the Belt Ends.

? (1.) I have a 5 h.p. twin with sidecar, all belt driven. I recently bought a new lin. belt, and after a sixty-five mile run found that the rubber covering had torn away from the sides at the belt end for a good inch. The belt, of course, had stretched, but was then not over-slack. I may say that the same thing occurred with the old belt, but it had run over 800 miles before it happened. I have only just recently had the engine pulley skimmed up, and it is perfectly true and smooth. The belt pulley is a shade slack, but not excessively (Sturmev-Archer three-speed hub gear), and also runs quite truly. Is there any sort of belt and protector which could be used to prevent this? I thought of cutting out of $\frac{1}{4}$ in. thick rubber a piece shaped  and facing the end of the belt with it. Do you consider this the best thing to prevent the side ends of the belt from tearing away? (2.) When travelling on the level or on a decline, as soon as the speed reaches 30 m.p.h. the engine develops a loud vibratory rattle, and seems as though it was over-running itself, just as if the pistons were unable to keep up to the speed of the machine. The rattle stops as soon as I throttle the engine down to below 30 m.p.h. The rattle does not develop when the machine is pulling up a long steady incline or a hill. The engine otherwise runs splendidly. I obtained sixty-five miles out of one and a quarter gallons of petrol, including several restarts. The engine is free from carbon deposit. There is little side shake in the engine pulley, but I am assured that it is not sufficient to affect the even running of the engine. I may say that there has been rather more than the correct space between the tappets and the valve stems, and I am having the stems lengthened so that I can adjust them correctly. Is it possible for this to be the cause of the trouble?—R.C.T.

(1.) You can get a satisfactory belt end protector from most accessory dealers. Your idea seems to be quite good, but the worst of it is that a 5 h.p. twin is really rather too powerful for belt transmission with a sidecar, chain drive being much better. (2.) What you complain of is an engine "period" due to the particular manner in which the engine is balanced. The difficulty might be overcome by having the balance of the engine altered in accordance with the directions given in our pamphlet on balancing. The tappet adjustment would in no way cause the trouble.

Knocking.

? I am having some trouble with my 1914 $\frac{3}{4}$ h.p. Centaur motor bicycle. It has just been rebushed, and has had new piston rings fitted, but knocks, and will stop on a slight hill when on high gear, and sometimes when changed to high on the level, but when put on low it will rev. again merrily. I shall be grateful if you can tell me the cause of the knocking and loss of power, and the remedy. It will not take hills now which it used to take on high gear with no effort.—A.E.L.

It seems very likely that the knock is due to the new bearings and piston rings being rather a tight fit. Run the engine for about two hundred miles, well within its power, and use plenty of lubricating oil, and if the engine shows any signs of slowing up while running during this distance, stop immediately so as to avoid a seizure. If the engine does not improve, it will have to be taken down and each bearing carefully examined to see if there is any tightness anywhere. Also check the timing in case this may have been altered.

IMPORTANT NOTICE.**GOODS MADE IN GERMANY.**

The proprietors of this journal, being fully in accord with the recommendation agreed upon at the Paris Econom'c Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication

ILIFFE & SONS LTD.

Alteration of Price.

? A few weeks ago I purchased a new machine of a prominent make from the makers' London office. I paid the firm £60, roughly half the cost of the machine, and received a typewritten bill stating the full cost of the machine, with a receipt for £60 attached, as the machine was not ready for delivery. I arranged to pay the balance when it is. Since I purchased the machine the price has been raised, and on enquiry at the office as to how I stood I was told by the manager that I should be required to pay the extra amount, the manager showing me one of the firm's catalogues, in which they stated that they held themselves at liberty to alter their prices at any time. It seems to me that this would only apply to prices in a catalogue, but not to a machine already purchased at a certain price, and on which a deposit had been paid. How do I stand legally as regards the machine?—H.C.D.

Unless it can be shown that you purchased on the conditions in the catalogue, the firm you refer to have no power to increase the price, but must deliver in accordance with the receipt for the amount paid on account. The catalogue may have been brought into the matter in various ways. For instance, there may be a printed intimation on the receipt itself that the purchase is subject to the terms set out in the catalogue, or there

may have been correspondence between you and the firm, and their letters may have shown that they were selling on the terms set out in that catalogue.

Uneven Firing.

? (1.) My machine is a 5-6 h.p. Indian, which I have just had overhauled. After a priming it will start on the stand at the first turn over, and fires quite evenly. But when I try it on the road I have to run with it ever so far before it starts, and then it only fires on the front cylinder till I get going at a good speed, and then the engine fires quite evenly again. (2.) What mileage should I get from a gallon of petrol? (3.) How many miles an hour do you think I could obtain? I might state I use the machine solo.—J.G.

(1.) It very frequently occurs that when a motor cycle is overhauled the carburetter and inlet pipe joints are not made airtight. If this is the case, you would find that the machine would behave in exactly the manner described in your letter. See that all unions are absolutely tight, that your magneto is in good order, that the carbon brushes are clean and are making good contact, and that the platinum point surfaces are bright, and we think you will then find that the machine will start easily and fire regularly. (2.) About seventy miles to the gallon. (3.) About fifty miles an hour if in good order.

EXPERIENCES WANTED.

"H.J.T." (Boxmoor).—Ixion sidecar-ette or Lévis or other small two-stroke or four-stroke and light sidecar.

"J.P.H." (Masselbrough).—Scott and Binks carburettors on Scott motor cycle using (1) Petrol, (2) benzole, and (3) paraffin, with special reference to m.p.g., slow running, power, and frequency of decarbonisation.

RECOMMENDED ROUTES.**EAST CROYDON TO CHESTER.—R.C.**

East Croydon, Croydon Road, cross Mitcham Common, Mitcham, Merton, Kingston Road, Raynes Park, Kingston, Teddington, Hounslow, Heston, Southall; here you are on the main Oxford Road, which follow through Beaconsfield, High Wycombe, West Wycombe, Stokenchurch, Wheatley; here turn right and go through Islip, Bletchington, Over Kiddington, Enstone, Chipping Norton, Broadway, Evesham, Worcester, Kidderminster, Bridgnorth, Wellington, Whitchurch, Chester.

SCARBOROUGH TO BETTWS-Y-COED.—E.H.B.

Scarborough, Pickering, Holmsley, Thirsk, Ripon, Ripley, Blubberhouses, Skipton, Gisburn, Citheroe, Whalley, Preston, Tarleton, Rufford, Ormskirk, Liverpool, by ferry to Birkenhead, Hawarden, Mold, Ruthin, Cerrig-y-Druoid, Pentre Voelas, Bettws-y-Coed. Approximately 210 miles. This route avoids as much traffic as possible, but entails a very hilly road to Skipton. The most direct route would be through a large manufacturing area, many towns, and much traffic.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged; when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

RIDER TROWARD and Co., 31, High St., Hampstead.—Orders now being booked for earliest delivery of the new A.B.C. [2254]

CROW Bros., High St., Guildford, have contracted largely for the new A.B.C. Order now for earliest delivery. [5298]

JONES' Garage—We are in a position to accept orders for A.B.C. motor cycles; deposits optional; delivery April or May.—Broadway, Muswell Hill, N. [0991]

WE are now booking orders for earliest deliveries of A.B.C. motor cycles. Secure an early delivery by placing your order with us now.—Dawells' Garage, Wigan. Tel.: 328. [X3219]

A.B.C.—We are now taking orders for earliest deliveries, which commence about May; book early to be in time.—P. Ellis and Co., 360, Lillie Rd., Fulham, London, S.W.6. [5373]

A.B.C.—Earliest possible deliveries given. Write to us for specification and full particulars.—The Talbot Garage, Ltd., Mersey Sq., Stockport. Tel.: 500. Distributing agents for Lancashire and Cheshire. [0990]

Abingdon.

ABINGDON and Sidecar, smart turnout; £38.—Hall, next to Green Man, High Rd., Whetstone, N.20 [5340]

MOTOR CYCLES FOR SALE.

Abingdon.

ABINGDON King Dick, 1914, 3½ h.p., 3-speed, tyres good, lamps and horn; £30 for quick sale.—Martin's Motor Works, Sidmouth. [5525]

A.J.S.

CROW Bros., Guildford.—A.J.S. Agents since 1912. Write us for your requirements. [9777]

A.J.S. 1915 4 h.p. Combination, only 4 months' use; £100.—Martin's Motor Works, Sidmouth. [5526]

1919 A.J.S. Combinations—Write Merrick's Stores, 174, Listerhills Rd., Bradford. Phone: 2439. [X2430]

A.J.S. Combination, 6 h.p., 2-speed, all chain, excellent condition, stored during war; £60.—53, Brixton Rd., S.W. [5296]

RIDER TROWARD and Co., 31, High St., Hampstead.—Orders now being booked for earliest delivery of the new A.J.S. [2255]

1918 A.J.S. 6 h.p. War Office Combination and all accessories; nearest £130 secures.—Melrose, Boughton Park, Worcester. [X5525]

A.J.S. 6 h.p. 1917 Combination de Luxe, complete, lamps, speedometer, hood and wind screen, as new.—A. Henderson, Westward Ho. [X5396]

A.J.S.—For quick deliveries try the sole Leicester-shire agent, Will Chapman, 113, Belgrave Rd., Leicester, the first appointed A.J.S. agent. [3531]

2½ h.p. 1916 A.J.S., 3 speeds, kick starter, recently overhauled at works (cost £29), absolutely as new and complete; £78.—Cross, Jeweller, Rotherham. [X5573]

3½ h.p. A.J.S., 3-speed, clutch, been re-enamelled, plated, and overhauled at cost of £16; £44; new appearance.—15, Birchwood Rd., West Byfleet. [5395]

A.J.S. 1918 Military Model Combination, hood, screen, lamps, spare wheel, splendid order, complete; £145.—Elce and Co., 15-16, Bishopsgate Av., Canonville St., E.C. [0551]

1918 6 h.p. A.J.S., military model, delivered Dec., done 650 miles, fitted lamps, etc., either separate or with coach sidecar to suit; what offers?—Walton, Dawson Sq., Burnley. [X5468]

A.J.S.—For the earliest possible deliveries of 1919 models, specifications, and super service, try the A.J.S. Specialists, The Walsall Garage, Wolverhampton St., Walsall. Phone: 444. [4663]

A.J.S. Spares, prompt delivery.—Cyril Williams, Chapel Ash Depot, Wolverhampton. Tel.: [9189]

Alldays

ALLON, 2½ h.p., 2-stroke, 2 speeds, perfect; £32.—211, Garratt Lane, Wandsworth. [5601]

1917 Allon, perfect condition; £28/10.—Guy, 59, Bathurst Mews, Sussex Sq., Paddington. [5566]

ALLDAYS Allon, 2½ h.p., 2-speed, 1916, had little wear, but shabby; £35.—3, Park St., Wellington, Salop. [X5444]

ALLDAYS-MATCHLESS, 4½ h.p., 3 speeds, countershaft, sidecar; £55.—211, Garratt Lane, Wandsworth. [5608]

ALLDAYS Allon, in stock, 1915 2-speed and 1916 2-speed hand clutch—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green, N. [5448]

RIDER TROWARD and Co., 31, High St., Hampstead.—Orders now being booked for earliest delivery 2-speed and clutch Allons, £58; also De Luxe models, with kick start, £65. [2258]

Ariel.

CROW Bros., High St., Guildford, Ariel agents since 1913, have 1919 models in stock. [5299]

ARIEL, 3½ h.p. and 6-7 h.p.; early deliveries.—F. Speakman, Ariel Expert, 7, Rochdale Rd., Harpurhey, Manchester. [5269]

ARIEL, 3½ h.p., 1912, variable gear, decompressor, lamps, tool 2 tanks, spare valves, good tyres, smart, last used 1914; £26/10.—66, High St., Chatham. [5570]

ARIEL, 1915, 3-speed, 3½ h.p., with coachbuilt sidecar, countershaft gear, clutch, decompressor, lamp, horn, speedometer, electric rear lamp, splendid running order, only done 5,000 miles; £57/10.—1, The Crescent, Nottingham Rd., Melton Mowbray. [X5505]

RIDER TROWARD and Co., 31, High St., Hampstead.—New 3½ h.p. 3-speed Ariel in stock, £80. Orders being booked for earliest delivery 5-6 h.p. combination. [2257]

Arno.

ARNO, 3½ h.p., splendid condition, Philipson governor pulley, Stewart speedometer, acetylene lighting set, Dunlop tyres and belt; £32, bargain.—88, Rosebank Avenue, Sudbury Hill, Middlesex. [5497]

Auto-Wheels.

UTO-WHEEL, Model de Luxe, complete, perfect running order, equal to new.—Akrill, 18, Market Place, Eberley. [X4856]

MOTOR CYCLES FOR SALE.

Auto-Wheels.

AUTO-WHEEL, little used, £8/8; another, £10/10; exchanges.—Geo. Smith, Motor Cycle Depot, Clapham Junction (opp. Arding and Hobbs). [X5404]

AUTO-WHEEL, good hill-climber, attached strong B.S.A. bicycle, all in good running order, also spares; what offers?—Box L9,774, c/o The Motor Cycle. [X5456]

WALL Auto-Wheel, Amac carburettor, mag., decompressor, little used, and in first-rate condition, runs well on benzol; £10.—Smith, 55, S. Norwood Hill, S.E.25. [X5552]

AUTO-WHEEL, complete, new condition, perfect running order, guaranteed; can be seen by appointment; price £12/12, 6s offers.—Craig, 231, Grove Terrace, Whitworth, Rochdale. [X5392]

Bat.

BAT-J.A.P. 8hp. 3-speed 1915 Combination, perfect condition.—Box 3,059, c/o The Motor Cycle. [X5516]

BAT Motor Cycle, 3-speed Armstrong, U.K. mag., Watatwa belt, sidecar chassis, with tyres, engine requires repairs; £10, or offers.—W. H. Bront, Sunnyside, Hatch Ride, Crowthorne, Berks. [X5541]

Blackburne.

CROW Bros., High St., Guildford, are old Blackburne agents, and can give early deliveries. [X5300]

JONES' Garage.—We can accept orders for all models of Blackburne motor cycles; delivery expected in April; deposits optional.—Broadway, Muswell Hill. [X0992]

Bradbury.

BRADBURY, 4hp., free engine; £28; any trial.—272, Green St., Upton Park, E. [X5631]

BRADBURY 4hp. Combination, free engine, pedal start; £28.—29, St. Leonard's St., Bromley-by-Bow. [X5537]

BRADBURY 4hp. Combination, 2-speed free engine gear box, lamps, speedometer, spares; £45.—1, Ward's Ter., Broad Lane, Tottenham. [X5713]

BRADBURY and Sidecar, fine condition, 4hp., 2-speed, clutch; bargain, £55; bought car.—Corawell, Shoreham, Sevoinks, Kent. [X5306]

BRADBURY, 3½hp., 2-speed, and sidecar, thorough mechanical condition, Dunlops, front nearly new, back little wear; seen Saturdays and Sundays, by appointment preferred; £55, or near.—11, Gilton Rd., Sydenham, S.E.26. [X5514]

BRADBURY, 4hp., new cylinder, piston, complete, B. and B., P. and H. lamp, good belt; £17; Humber, 3½hp., 1911, new tyres, Senespray, good condition, not ridden last 3 years, horn, lamp, etc., £21.—Kirby, Snitterby, Kirtton-Lindsey, Lincs. [X5506]

BRADBURY 6hp. Combination, believed 1915, 3-speed countershaft, handle-bar clutch, kick starter, Lucas horn, lamps, tools, excellent condition, engine just overhauled and rebushed, new chain, good tyres; £80; seen evenings or week-ends.—Challis, 11, Allmarthing Lane, Wandsworth. [X5638]

Brough.

BROUGH, 3½hp., 2-speed countershaft, flat twin; price £60.—27a, Ashchurch Grove, Shepherd's Bush. [X5531]

DAN GUY, Weymouth.—1916 3½hp. Brough, 2-speed gear, overhauled by makers; guaranteed condition, £55. [X5686]

BROUGH—A limited number of 5-6hp. flat twin combinations; delivery in April.—G. W. Wilkin and Co., sole agents Sheffield and district, Hunters Bar, Sheffield. [X5612]

B.S.A.

B.S.A., 3-speed, 1919 models in stock.—Reys, 378, Euston Rd. [X2972]

NEW B.S.A.'s in stock; immediate delivery Model K.—Alexander, Agent, Wallasey Village. [X506]

B.S.A., 3-speed, kick starter, countershaft model; £58.—Clapham (Motors), King George St., Greenwich. [X5527]

1914 B.S.A., unscratched, with lamps; 35 gns.; ride away.—Wright, 113, Blair St., Poplar, London. [X5463]

B.S.A., 3½hp., 2-speed, clutch, chain-cum-belt; £33.—Earls, The Vale, Hampstead. Phone: 3287 Hamp. [X5679]

B.S.A., 1916, chain-cum-belt, and coachbuilt sidecar, excellent condition, any trial; 65 gns.—Tew, Petersfield. [X5467]

B.S.A. Clutch Model Combine, 2 lamps, speedometer, in excellent condition and tyres, any trial; £45.—38, Upham Park Rd., Chiswick. [X5461]

4½hp. B.S.A. Combination, 3-speed countershaft, all chain, lamps, speedometer, etc., late model; £75.—Thorpe, Whitehorse Rd., Thornton Heath, S.E. [X5516]

THE PROOF OF THE PUDDING!

From *The Motor Cycle*,
March 6th., 1919.

Makers and Prompt Service.

SIR,—In your issue of February 13th I noticed that "G.R." was worried by the fact that he wanted to cancel his order for a machine, and the firm he ordered it from refused to cancel it. I should like first to state my experience in that direction.

Two months ago I ordered a Big 4 Norton sidecar from Messrs. Godfrey's, Ltd., to be delivered this February. Only thirty days ago I discovered that I should have to cancel the order, as I have to go out East. I wrote Messrs. Godfrey's, and asked if they would cancel the order, and explained why. By return of post I received a very courteous letter and also a cheque for £5, the deposit I paid in December. This difference in treatment, I think, well illustrates the difference in firms. I do not know from which firm "G.R." ordered his machine, but I think I know where he will go for another machine when he wants one. I was treated exceptionally well by Messrs. Godfrey's, and I have no interest in the firm whatever, except that of a prospective customer. When possible I shall go straight to them for my machine.

W. T. VIZER-HARMER (Lieut.).

The above is
authentic proof—
if proof be needed
—that Godfrey's
always study the
interests of their
customers.

Write for full lists of new
machines for which we
can accept orders.

Armstrong and Sturmey-Archer

GEAR REPAIRS

in

4

HOURS.

We have every Armstrong and Sturmey-Archer part actually in stock. We can repair your gear in four hours with tested parts exactly as we are supplying to the British and Allied Governments and guarantee them.

RECOMMENDED BY
THE
STURMEY-ARCHER Co

E. C. Neil, Esq., Pease Hill Farm, Ripley, writes:

"I have broken my compound cage and have been advised by the Sturmey-Archer Co. to write to you."

S. Hoole, Esq., Offerton Grange, Sunderland, writes:

"In March last you repaired my Armstrong gear and it has given me every satisfaction since—no trouble whatever."

H. O. O. Rubbin, Esq., Stocken Hall, Stretton, Oakham, writes:

"I may say that the hub which you repaired for me early last year has never given any trouble since."

We claim the following to be a RECORD IN GEAR REPAIRS.

Coworth Park, Sunningdale, Berks, 14/12/16.

Dear Sirs,—I must thank you very much for repairing my gear while I waited. To fit new parts and assemble gear complete into wheel, after same has been completely dismantled, in about **thirty minutes**, speaks very well for your tools, workmen, and organisation. I have since tested the gear and found it perfect.

Yours faithfully, W. H. BROOKS.

Make a note of address. If you have gear troubles, write, wire, 'phone, or call.

Send wheels to Hounslow, L. & S.W. Ry., clearly labelled with sender's name. Nearest station for callers, Heston—HOUNSLOW District Railway.

COUNTY ENGINEERING Co.

64, STAINES ROAD, HOUNSLOW, LONDON, W.

Wires: "Threespeed." 'Phone: Hounslow 322.

Cast off the Fetters!

IT is very difficult at the present time for those not in the heart of the movement to gauge the widespread influence of the motor industries on the national life.

The time has now come when those who so loudly decried the value of motor vehicles to our existence as a nation are feeling the loss of the support of the opinion of an uninformed public. The daily press has had the truth forced home to it by the indisputable value of motor vehicles in war, and it is beginning to acknowledge their invaluable aid in times of peace. And even those papers whose former attitude with regard to motor cycles was one of opposition based on ignorant prejudice are beginning to take a more enlightened interest in this most useful means of locomotion, though in some cases their interest seems to take the form of somewhat enthusiastic reference to the more freakish examples of motor cycle construction.

To consider the question purely from the viewpoint of the motor cycle, in gauging the probable state of future markets for these machines, we must take into account the numerous fresh sources of potential motor cyclists, such as those of both sexes, who have been introduced to the petrol engine in the Services, and home transport organisation. Many are the schools of motoring which have sprung into being, but there is a more potent recruiter of good opinion than these. For four long years the public has had dinning into its mind by ear and eye, by hearsay and observation, that this is the mechanical age, and that the supreme and most useful mechanism to all alike is the internal combustion engine—whether it be adapted to the R.A.F., lady driver's mount, the officers' car, the aeroplane, the caterpillar tractor, or the tank. And the result is that the public have begun to think about it, and later will recognise the possibilities of its future, if they have not done so already. Then it is but a step to pondering over the possible benefit to the

individual. How can he take advantage of it? "The motor trade has a big future," he says, "I'm too old to dabble with it now myself, but I'll put my boy into it."

War-time Appreciations.

Then there is the man who has donned khaki. In battered France and muddled Flanders he has come into daily contact with the automobile in some form or another—in fact, his life has often depended on it. Moreover, *The Autocar* Schools in neutral countries for interned men of the Forces have evidenced the popularity of the subject. The Government has even gone so far as to arrange for training in mechanical transport subjects; classes have been founded in most of our big cities, both at home and in the colonies, and the leading firms have wisely developed training systems in their own factories. The latest news is that the Government is considering the granting of State assistance towards the training of young engineers.

All these things are true and recognised, yet in an enlightened and supposedly progressive country the man who makes these things possible is the man selected for the imposition of the most unfair, ridiculous, and old-fashioned legislation ever tolerated. Is it not time to end it? Soon *millions* will depend upon the evergrowing industry for a livelihood. If they are not to be disappointed the industry must be unhampered. To-day is the time when unity of action is extolled. The trade and the public are united by mutual representatives to secure a measure of reformation in many things concerning motordom as a whole. Let them make a clean sweep! and hack and cut with resistless energy till the manufacturers and the people are free of every impeding fetter. Then, and not till then, can we look forward to a future of commercial success which will not only benefit the man who produces motor vehicles and the man who uses them, but all without class or distinction—and that is true prosperity.

The A.C.U.

I READ Major S. R. Axford's article on the A.C.U. with much interest. Its commonsense, its enthusiasm, and its optimism were all very taking. What strikes me about the A.C.U. is that it necessarily appears before the public in a white sheet, because it has a past of sorts to live down. In the old days its main work was the organisation and control of competitions, in which the bulk of riders were not interested. It signally—though perhaps inevitably—failed to protect us from the rapacity of petrol trusts, the persecution of any police authorities who chanced to be malicious, and the callous cynicism of Parliament. The consequence was that the average provincial motor cyclist was bored stiff with the A.C.U. and its claims. At the annual meeting of his club he got on his hind legs and pointed out that the club got no very obvious *quid pro quo* in return for its affiliation fees; practically every club secretary had to stand this racket, and defence of the A.C.U. was not too easy. Personally, I always felt that it accomplished just about as much as was possible in the way of political and public action, whilst its trials were tolerably well run, and such shortcomings as they exhibited were due rather to the power of the trade than to the weakness of the committee or officials. After all, the R.A.C. is an infinitely more powerful body, and was equally helpless in the face of police traps, asinine speed limits, petrol profiteering, and other injustices under which private motorists labour. Still, the fact remained that the benefits were rather nebulous, the subscriptions tangible, and the value of membership not easily demonstrable.

The officials have done wisely in working out one benefit which touches every potential member—the “get you home” scheme. If on the top of that they can offer the provincial member a little genuine assistance in legal matters, they are sure of a membership which will give them a real position as our representatives, and also furnish the sinews of war. Afterwards, in conjunction with the R.A.C. (which also seems to be waking up) and the Parliamentary motor-ing committee, they may manage to procure us rather better treatment at the hands of the law and the police and the fuel syndicates. If these ideals are to materialise, the A.C.U. needs three things: (1) A “live” committee, (2) a thumping membership, and (3) plenty of money. Let us all back it up; and if it lets us down again, we will deal faithfully with it in say, two years' time.

Club Rooms.

I ALWAYS wonder that so few towns boast a club room for motor cyclists, and the A.C.U. may see its way to organise such rooms. If you are a Mason or a Forester or an Oddfellow or a commercial traveller or a bookie, you are never at a loss for a pleasant evening in a strange town. If you are a motor cyclist, you arrive in a strange place, and there is

nothing to be done except to soak in a local bar, or give the promenading shop girls a treat, or wander dolefully about gazing at church spires until it gets dark and cold and you return to your inn. The pity of it is that you are probably quite red-hot about your hobby, and bursting with ideas after an aggravating day in bad weather with a dud mount or a topping run on a good one. Hidden somewhere in the town are umpteen other fellows, all equally keen, and enjoying nothing better than an evening's “shop.” But you cannot get together anyhow. Now the rent and furnishing of a room are not expensive. You can often hire such a room over a garage, with a telephone handy to ring up the club secretary. I am not thinking of the cosy quarters, complete with bar, which such clubs as the Edinburgh M.C.C. run; for something much simpler would fill the bill.

Propaganda Work.

OR take propaganda work. During last winter the Aeronautical Society ran a series of magnificent lectures on various aspects of aviation in some of the leading munition centres. Motor cycling clubs usually languish a little in winter time, as many riders are fair weather birds. The old A.C.U. membership included dozens of men who were capable lecturers: some of them were racy *raconteurs*, some were technical experts, etc., etc. At small expense the A.C.U. could provide most of the provincial clubs with a monthly lecture during the “off” months. The army has made us all more “clubbable” than we used to be. There is an infinite variety of topics to select from. Lots of the provincial riders never go to the shows or the Six Days or the T.T., and would appreciate a lively talk on them from a man who is an authority. The D.R. and M.T. men from various fields of war could furnish excellent evenings' entertainments. There is no reason why aviation and submarine work should not be dragged in—they touch mechanical interests which are akin to our own. Plenty of men would tackle such jobs for railway fare and hospitality without fees. To put it in a nutshell, the A.C.U. can never do justice to its political duties unless it has the clubs and the individual riders behind it: and it cannot gather them in merely by organising a couple of annual competitions, writing dignified letters of protest to the Home Secretary, and towing lame dogs to the nearest garage free of charge.

Tiny Carburetters.

I HAVE often wished that some technical expert would publicly discuss the design of microscopic carburetters. I am merely a practical rider, and wholly unqualified for handling the subject. But all my road experience suggests that wee carburetters are peculiarly liable to “flood.” If I buy a car with a gasometer type of carburetter, I know it will never flood till the needle wears. If I buy a motor cycle of 500-1,000 c.c. I may get occasional flooding as the

Occasional Comments.—

result of vibration, e.g., when a semi-balanced engine is doing 2,000 r.p.m. on a low gear; in the course of time the needle will wear: there is (probably) no filter, and flooding will occasionally result from dirt on the needle valve seating. Nevertheless, flooding will be the exception, not the rule. But if I buy a tiny two-stroke with a float chamber section resembling a penny, I am sure to experience a great deal of flooding, even with a perfectly pointed needle and a clean seating: how far it is due to the vibration of an engine which has a wart on its piston, how far it is ascribable to small petrol flow and quick float action, how far the blame should be put upon other factors is unknown to me.

A New Competitor ?

TO-DAY I realised with a start that the costlier motor cycle outfits, the cycle cars, and the cheaper cars may soon have to reckon with a formidable rival. I was shown a photograph of a "private owner's" aeroplane. It differed widely from the £800 machines with 80 h.p. engines which certain newspapers, which have gone off the deep end on civilian aviation, have depicted. It was a tiny monoplane fitted with a flat twin motor cycle engine, and reminded one, in its general conception and dimensions, of the quaint little turf-hopper on which Santos Dumont used to scuttle round aerodromes in the days of Cody and the Hon. C. S. Rolls. This aeroplane is going into early production to sell at £200, even in these days of expensive materials and high wages. Nor is it made by Henry Ford. Moreover, the price includes a kit of likely spares.

From the expenses of such a purchase to a side-car's annual bill may be a far cry at the moment. But things move fast. This is a far simpler production job than the Ford car, which has been sold in its country of origin at £75, and may be sold at less some day. The crux of extensive landing and rising grounds may be solved. Garage is simple. Here is a possible picture:

A man of Ford's mental calibre concentrates on the popular aeroplane, and sells it at £75 eventually. It uses four gallons of fuel per hour, and covers a hundred miles. You take off and alight on sidings

abutting on the new high-speed motor roads, which must arrive sooner or later. To store the 'bus, you unhook the wings, and halve a jointed fuselage, packing the whole concern in a space little larger than a cycle shed.

Industry is certainly heading towards giant production by super-manufacturers, and squeezing out the small-minded and inefficient men.

The Farmer's Motor Cycle.

I SPENT my last leave in an agricultural county, where the average acreage held by each farmer is well under a hundred, and even the profiteers do not run to motor cars. At the same time the local transport system is just about as prehistoric as survives anywhere in Great Britain. The anti-joyride restrictions were then in force, and I travelled from 8 a.m. to 7 p.m. in a variety of conveyances invented by Noah in order to spend an hour with a man who lived precisely nineteen miles away. When I had blown off steam on my return, I enquired what transport the residents employed. The local motor cycles were all of the British twin-cylinder s.c. variety. I interviewed several intelligent owners, and they taught me some new swears which would have brought unction to my soul at the end of my own thirty-eight miles in eleven hours. First and foremost, they cursed nickel plating more heartily than a mediæval inquisitionist ever cursed a Protestant. Not because it rusted. They cared nothing for appearances. But because it prevented the bicycle from selling when they tired of the old mount, and hours in pouring rain under hedges had turned its bar, hubs, bolts, etc., a speckly saffron. Secondly, they cursed the sidecar, its shape, dimensions, finish, splinterability, dintability, everything about it. And no wonder, for they had used these fine Coventry-built coachwork sidecars to carry calves, pigs, lime, manure, seed potatoes, firewood, sulky bits of binders and harrows, and other impedimenta. Sidecar designers, please note that the agricultural sidecar must be roomy, afford a comfortable seat for the best girl or wife on gala days, and yet accommodate the maximum load of farmhouse cargo on demand. Whether it can be done with one body, or whether two rapidly interchangeable bodies are needed, deponent knoweth not.

BAFFLING THE MOTOR CYCLE THIEF.

Owing to the large number of Government cars and motor cycles lately stolen, all drivers are supplied with a padlock and chain, which has to be used whenever the machine is left unattended. The motor cycle to which a W.R.A.F. is seen fixing the lock is a P. and M

IMPROVING THE MOTOR CYCLE.

The Best Solo Machine Specification in the Suggestions Competition invited in Connection with our "Which Type" Referendum.

THE suggestions for improvements in details of motor cycle design received in connection with the "which type" referendum are many and varied, and range from mudguarding to valve operation, many readers putting forward similar ideas, so that the segregation of the winners has been more than a little difficult. The chosen suggestions, however, embody most of the principal features asked for by the majority in addition to fresh ideas. The winner of the solo class is Capt. R. de H. Haig, R.A.F., Chattis Hill, near Stockbridge, whose specification is as follows:

FRAME.—Treated with real anti-rust dull black finish, nuts coppered and nickel-plated or black. Straight tubes as on the A.J.S. Long steering head; great attention paid to angle of rake, as this affects skidding tremendously. Good sized oil holes to steering head bearings.

WHEELS.—Both wheels quick detachable, interchangeable if possible; if not, P. and M. type front, Lea-Francis type back; very heavy gauge spokes, as on James; Rudge type spokes; Roman rims; at least two security bolts; if satisfactory, Sankey type wheels, are preferable.

BRAKES.—Rim type front and back, carefully designed as on Lea-Francis.

HUBS.—Must be mudproof and should have no oilers and have roller bearings or self-aligning ball bearings.

STANDS.—Back stand extra strong, spring up; must not interfere with wheel removal; front stand under engine, and act as undershield, as on Lea-Francis.

MUDGUARDS.—Front guard as on Enfield, only much stronger at supports and packed to prevent rattling; all bolts locked up with locknuts or

patent nuts. It should have non-drip edges and plenty of clearance; back mudguard with valances all round, but must give in. at least each side of tyre clearance, and be quickly detachable as on Enfield; both guards galvanised or anti-rust treated; back mudguard should have an extra stay at rear end.

FORKS.—Brampton biflex type, with long bushed bearings adjustable to take up side play, screw-down lubricators of a good size.

HANDLE-BARS.—Adjustable, as on Indian, different patterns provided to suit customers.

CHAIN CASES.—Quick detachable, Lea-Francis front case clips for both cases, and of stouter construction.

TANK.—N.U.T. type, rounded with straps, I.O.M. T.T. Rudge filler caps, petrol filter inside cap and in petrol pipe.

TOOL KIT.—Carried on top of carrier in flat wooden box, with recesses to take each tool.

FOOTRESTS.—Or boards, optional; both should be adjustable. Triumph rests are very good. There should be a splashguard like the A.J.S. on footboards.

SADDLE.—Leaf spring Brooks.

SPRINGING.—Some form of rear spring is essential. Saddle pillar or front down tube used as oil reservoir, as on the Scott. All bolts should be keyed as on Triumph, and where possible like the Scott cylinder holding-down bolts.

BACK WHEEL ADJUSTMENT.—By push bolts instead of pull, and of ample size.

ENGINE.—Outside flywheel V twin, flat or single, detachable cylinder heads, as on Blackburne, split or roller big end bearings, roller or self-aligning ball mainshaft bearings, force feed oil to all bearings from sump below crank case (the sump fed by birdfeed from oil tank), oil level indicator on side of tank, quickly adjustable tappets *à la* Isle of Man B.S.A., flange joints on induction pipe, which should

Details mentioned by Capt. R. de H. Haig in his specification as being very desirable features

- (1) The Rudge spring-up stand.
- (2) The Lea-Francis front brake.
- (3) Royal Enfield front guard.
- (4) Oil tank on seat tube.
- (5) Lea-Francis front chain guard.
- (6) N.U.T. tank.
- (7) Lea-Francis rear brake.

Improving the Motor Cycle.—

have a hot air muff, side-by-side valves with bolted down valve cap for both valves (three or four bolts). Exhaust pipe should be kept in place by clip joints. Magneto behind engine *à la* Clyno, chain-driven, and in same chamber as timing pinions. This chamber should be separate from crank case proper, and running in an oil bath.

The Indian adjustable handle-bars.

Crank case release of diaphragm type, and sufficiently large to maintain partial vacuum in crank case. Driving pinion on crank-shaft fitted as in White and Poppe engine, *i.e.*, dogs on pinion engage in recesses in shoulder on shaft and kept *in situ*

by a nut on the end of the shaft. Gudgeon pins should be held by spring washer, as in B.S.A.

PISTON.—Aluminium, and deeply recessed. Exhaust valve lifter should be an internal cam, as on Triumph, and, above all, a clean crank case. As far as possible, no cheese-headed screws. If the conventional internal flywheels are used, crank pin should be keyed, cone and nut on driving side, cone and nut on timing side. Further, holes should be drilled

through both flywheels opposite crank pin, and taking standard engine bolt for truing.

GEAR BOX.—Drive from engine by silent chain, to rear wheel by oversize chain. Gear box adjustable by eccentric method as on Lea-Francis, so that gear adjustments would not be altered. Gear levers *à la* 3½ h.p. twin James or like Triumph. Clutch control *à la* Sunbeam, *i.e.*, very light on handle-bar, three or four gears, all bearings to be ball bearings mounted in brass bushes when the gear housing is aluminium.

CLUTCH.—To be dry plate with easily adjustable spring tension. Kick starter to have internal teeth.

Finally, all Bowden controls should be easily detachable *in toto* from machine; this can be done by judicious saw cuts in terminals. They should be internal in handle-bar. All levers should give a straight pull as on Amac controls. The H.T. wires should be led through ebonite tubes to plugs. There should not be more than three sizes of nuts or bolt heads—say ¼ in., ⅜ in., ½ in., and of the same standard threads.

Magneto chain case integral with the crank case, as in the Star motor cycle.

Selective Clutch Gears for Lightweight.

An Appeal for Simplicity and Foolproofness.

THE writer is very much in favour of selective clutch gears on the lines of the P. and M. and Enfield for lightweight machines, and certainly it seems that a heavy gear box is out of place, apart from the question of cost, on these little mounts. In the first place, the essence of the lightweight is foolproofness and simplicity, and the selective clutch gear affords the most foolproof transmission possible. When old it is not good for the heavier types of vehicles, and it works at its best and sweetest when not overloaded; so that its wearing properties are practically indefinite when it is applied to this type of mount.

A gear box, besides being costly, adds complications, and robs the machine of its essential simplicity. For it to work satisfactorily a friction clutch must be used in addition, which means an additional unit and an additional control. The lightweight clutch must be small and light, and small clutches are not always very good. If the clutch is dispensed with the transmission is far from being foolproof, and the machine far from what might be desired in the way of controllability. I have possessed lightweights having the "simple" dog-clutch change, which were more difficult to handle than a 40 h.p. car, and similarly I have seen such machines in the hands of inexperienced riders perform all sorts of acrobatic feats, such as rearing up vertically on their hind wheels. It is surprising what the gear boxes will put up with, though such abuse is painful to experience and behold.

A lightweight machine should be such that any novice, who has had no previous experience, can handle it straight away without difficulty. I am in favour of the chain-cum-belt drive on these light mounts on account of its sweetness, cleanliness, and simplicity, and with a selective clutch gear it makes an excellent combination; but there is no reason why, given a good selective clutch gear, an all-chain drive should not be employed without the necessity for a shock absorber. At all events, a cush hub is all that is required for damping out the snatch should chains be employed, and the all-chain Levis with Enfield transmission system is a sweeter running mount than many of its belt-driven comrades; whereas, given an absolutely positive drive, as when a gear box is employed, some additional shock absorber is required, its need being felt chiefly when starting up from cold.

Effective Flywheel Weight.

Again, these small engines are apt to attain terrific revs. almost in the fraction of a second when the load is suddenly relieved by placing the lever in the free position, and one proceeds through traffic with the engine alternately racing and konking unless it is well tuned. This kind of thing is very rough on a gear box, whereas a selective clutch gear, judiciously handled, can be so manipulated as to keep a progressive load on the engine. Also, since the engagement of the gear is always more or less progressive, stresses on engine and machine are lightened.

CHINOOK.

CURRENT CHAT

Times to Light Lamps.

GREENWICH TIME

Mar. 20th	6.40 p.m.
" 22nd	6.44 "
" 24th	6.48 "
" 26th	6.50 "

Police Activity.

We are advised that the police are particularly active on the roads in the neighbourhood of Wanstead and Woodford, Essex.

Auto-wheel Car Races.

The proposed (?) T.T. for scooters has its parallel at Palm Beach, Florida, where American society ladies race with small four wheel "cycle cars" propelled by auto-wheels. These little vehicles are known as "Smith Flyers."

The Industrial Reconstruction Council.

A conference on "Industry and Educational Reconstruction" will be held under the auspices of the Industrial Reconstruction Council on Tuesday, March 25th, at 6 p.m., in the Hall of the Institute of Journalists, 2 and 4, Tudor Street, E.C.4. The chair will be taken by Mr. W. Peter Rylands, of Messrs. Ryland Brothers, Ltd., Warrington, and the opening address will be given by Mr. F. W. Sander-son, M.A., headmaster of Oundle School. Questions and discussions will follow. No tickets are necessary.

An Old Boys' Association.

An Old Boys' Association, for members of the R.N.A.S. Armoured Car Section, has been formed, and any motor cyclist who joined this force, and who would care to become a member, is requested to communicate with the Secretary, Mr. J. A. Johnson, 74, Queen's Avenue, Finchley, N.3. It is hoped to hold social meetings in London and in any provincial town where it is justified by the membership, and it is further proposed that the association should have a benevolent function.

A Case of Overloading.

The following is an extract from a reader's letter, which is an excellent advertisement for the machine he favours, but which refers to a rather prevalent practice of overloading which we do not support:

"I have a 1914 $3\frac{1}{2}$ h.p. three-speed Rover, to which I have attached a single-seated sidecar. My usual load is my wife, myself, and two children age nine and six years. The machine has taken the four of us, with the addition of three gallon tins of petrol and 36 lb. of luggage, to North Wales several times on top gear with an occasional drop into second."

A Super Scooter.

We have information that an improved motor scooter is to be placed on the market. This will be built in England in large quantities, and sold at a moderate price. The producers hope to have 200 ready by the middle of May, and to turn out something like 5,000 during the present year. The scooter will have a $2\frac{1}{2}$ h.p. two-stroke engine, a two-speed gear, chain drive, and 20in. wheels. The frame will be of very novel construction, and a seat will be provided. Further information will be published in our pages when the various patents have been accepted.

A Motor Cycle Trial in Australia.

News is just to hand concerning the Sydney-Melbourne Inter-state Motor Cycle Trial. Only three machines went through the trial without loss of points, and one of these was a $3\frac{1}{2}$ h.p. standard Zenith, ridden by Mr. V. R. Blackett. This machine reached Sydney in the early part of 1914, and is a standard type without clutch or kick-starter. Blackett had to compete against the very latest and most powerful American productions. It was the first to enter all controls and first to arrive in Melbourne.

Blackett has already attained a great deal of fame in Australia as a long distance rider who is able to effect a low petrol consumption on his machine. The official record throughout the whole trial shows that the machine averaged 110 miles to the gallon.

Blackett was also successful in gaining the prize for the most meritorious per-

V. R. Blackett, who made a splendid performance in the Sydney-Melbourne trial, averaging 115 m.p.g. and losing no marks.

Special Features.

"REVS." AND THE SINGLE.
IMPROVING THE MOTOR CYCLE.
A SPRING FRAME ATTACHMENT.

formance and the prize for the machine arriving in the best condition.

At the conclusion of the trial Mr. Blackett returned home, reaching his destination without any hitch, which means that he travelled 1,600 miles with very little rest and under very trying conditions.

Henry Ford Again.

The New York correspondent for the *Express* says that Mr. Henry Ford intends to retire from his factories and to manufacture a new type of cheap motor car to sell for £50. Edsel Ford, who makes the announcement, says that two sites for the new plant are under consideration at Hamilton, Ont., Canada, and Troy, N.Y.

The £50 car, according to Edsel Ford, will appeal especially to people going to and from work, who are now able to take only infrequent leisure trips. He says it will embody lightness with increased strength, and the reduced cost will be due to several new inventions. This rumour, however, is not substantiated by the Ford Motor Co. in this country.

B.S.A.

Popularity

and why—

B.S.A. CATALOGUE
FREE ON REQUEST

GUARANTEED INTERCHANGEABILITY.

No feature of B.S.A. Motor Bicycles is better known, and certainly none is more deservedly popular, than that of B.S.A. Interchangeability. First adopted many years ago in the manufacture of army rifles, interchangeability was soon rigidly enforced in all B.S.A. Productions. Every part is gauged at each stage of manufacture, and in the event of the detection of even so slight a variation as a thousandth of an inch the part is at once rejected. The advantages accruing from the guaranteed interchangeability of every B.S.A. Part are overwhelming, not the least important being that, in case of loss or damage, any replacement parts that may be necessary are certain to be exact duplicates.

6 h.p. Enfield sidecar outfits are now 120 gns., the 8 h.p. model is 2 gns. extra. With dynamo lighting the prices are 140 gns. for the 6 h.p. and 142 gns. for the 8 h.p. model.

War Tax.

The extra war tax of 6d. per gallon on petrol appears likely to remain until the Budget requirements for the year are under consideration. In the meantime the R.A.C. and other motoring bodies are making every endeavour to have the burden removed.

Why Stand Up?

Are we to arrive at the genuine lightweight motor cycle *via* the scooter? We feel convinced that those who now show enthusiasm for the motor scooter will sooner or later—most probably sooner (!)—demand a seat. It would be quite a sensible demand too! Having obtained a sitting position, we have the lightweight motor bicycle.

A.C.U. General Meeting.

A large attendance is expected at the Digbeth Institute on Saturday next, for the A.C.U. meetings. At 2.30 the Annual General Meeting will elect a president and vice-presidents, and receive the annual report of the union and balance sheet for the past year. At 3.30 there will be the annual meeting of individual members, to elect twelve individual members to serve on the committee for the ensuing year, and at 4.30 there will be a meeting, open to all interested in motor cycling, when Mr. E. S. Shrapnell-Smith, C.B.E., Major Axford, O.B.E., and others will speak.

The Channel Tunnel.

Nearly a hundred years ago the making of a Channel tunnel was discussed, and now once more an intense interest has been focussed on the project. All the plans are ready for the work to commence immediately, and only the Government's consent is needed. France has always supported the idea; and, had it not been for the military opposition in this country, the tunnel would by now have been an accomplished fact. It is highly improbable that a roadway for motor vehicles will be constructed at the same time; but even so the advantages to be gained, from the motorist's point of view, are too manifest for discussion on the subject. That a vast and new touring ground will be available without an irksome sea passage is one advantage—though probably a minor one—that will appeal to motor cyclists.

N.M.C.F.U. (Coventry).

A meet and run has been arranged for March 22nd, with a view to attending the A.C.U. General Meeting at Birmingham. There are now 1,400 members of this branch.

Public Schools M.C.C.

A meeting will be held at the R.A.C. on Wednesday evening, the 26th inst., to revive the Public Schools M.C.C., and all motor cyclists interested are cordially invited to attend.

A.C.U. TO EXCLUDE FOUR-WHEELERS.

DECISION OF THE GOVERNING BODIES.

At a meeting of the R.A.C. and A.C.U. Joint Committee, held on Monday of this week, it was decided that in future "MOTOR VEHICLES WITH THREE WHEELS OR LESS SHALL BE DEEMED TO BE MOTOR CYCLES ALL OTHER MOTOR VEHICLES SHALL BE DEEMED TO BE 'MOTOR CARS'."

Representatives of the A.C.U. Competitions Committee, who have special interest in four-wheel cycle cars and light cars, are to be invited to attend the R.A.C. Competitions Committee meetings with a view to assisting in the organisation of light car trials

Drivers' Precautions on Westerham Road.

We are told that drivers of the motor 'buses on the Westerham Road are strapped to their seats because of the vibration set up by the large holes in the road. Two of the largest holes are known to the passengers as the Salt Box and Biggin Hill bumps. Both bumps indicate stopping points.

L.M.C. Prices.

The prices of the 1919 L.M.C. motor cycles are £85 for the 4½ h.p. and £95 for the 6-7 h.p. twin.

One-strokes?

We frequently receive "designs" for double-acting two-stroke engines which are described as "one-strokes."

"Bush" Newsome back again.

Capt. C. T. Newsome, the ex-Rover exponent, is demobilised and has deserted the motor cycle industry. He has now an appointment with the Rover Car Co.

'The Engine of the Sidecar Machine.'

To-night (Thursday, March 20th), Mr. Eric Caudwell will read a paper on "The Engine of the Sidecar Machine" before the Institution of Automobile Engineers, at the Chamber of Commerce, New Street, Birmingham.

A Sale of Army Motor Cycles

There will be a further sale of Army motor cycles held by Aldridges (Messrs. W. and S. Freeman), St. Martin's Lane, London, W.C.1, at the Gilbey Hall, adjoining the Royal Agricultural Hall, Islington, entrance in Barford Street, beginning at 10.30 a.m. on Friday next.

The Slough Motor Depot

There is a possibility of the great Slough Army Motor Depot scheme being modified. It will be remembered that £1,700,000 was to be spent in the project. A great deal of this has already been spent, to say nothing of the waste that has taken place.

The New Transport Bill.

The opposition that the dock and harbour officials are making against the Government's proposal to place the Minister of Ways and Communications in authority over their administration is having more effect than the agitation by the motoring interests against the inclusion of road control under the new Ministry. So says *The Daily Mail*. How such a conclusion was formed, however, is difficult to understand, for the agitation of the motor world could not possibly have been more whole-hearted than it has been.

The peace model Grifon, exhibited at the Lyons Show. It is a lightweight twin, which does not appear to compare favourably with the latest British machines, and has all-belt drive and pedalling gear. It will be noted that no silencers are fitted.

A SPRING FRAME ATTACHMENT.

A Device to Convert Existing Rigid Frame Machines.

AT the moment, we can recall no firm specialising in converting conventional machines into spring frame mounts, and in view of the insistent demand for spring frames, owing to the condition of the roads at the present time, there appears no doubt that such a concern would receive support, provided the device they offered were efficient and the price moderate.

Over twelve months ago we illustrated a design for a rear springing attachment which was the invention of Mr. J. Warner, a Coventry engineer, but, owing to the war, nothing has been done in the way of marketing the device until recently. The arrangement, however, is not new. It has, in fact, been in regular use during the past three years on a Triumph machine, used both solo and with sidecar, and the fact that the invention has undergone very little alteration since we last saw it goes to show that its sponsors are satisfied with its performance.

Rigidity of Frame Retained.

As will be seen from the illustrations, the most outstanding features of the device are the double back stay and the single coil spring underneath the saddle. The rigidity of the frame itself is in no way lessened by the alterations which are necessary to fit the attachment. Probably a "spring wheel" is a more apt term to describe it than "spring frame," as the pivoting point is at the outer ends of the stays. The usual stay ends are replaced by two special members, in which swivel a pair of links that are continued normally in a straight line, and carry the wheel spindle at their middle,

The attachment fitted to a Triumph solo machine.

while an extra pair of stays are pivoted at their extreme ends. These stays normally are parallel with the rigid stays, and at the top, bridging the wheel, is a yoke, which is connected to a second link system placed immediately beneath the saddle and controlled by an adjustable spring. This upper link system consists of two plates or bars, which are attached to the yoke through a sleeve by means of a shaft which works on phosphor bronze

loads, such as when a sidecar is fitted or a pillion passenger carried, or both.

A company has been formed, to be known as Vowels, Ltd., with works at Mount Street, Coventry. This firm will undertake to make conversions. Where a machine is fitted with detachable "chain" stays it is only necessary to detach these and the rear stays for the necessary alterations to be made, otherwise the complete frame would have to be sent to have new stays fitted.

We understand that the price for the conversion is quite moderate, and that the workmanship will be guaranteed.

AMERICAN T.T.

AN American T.T. race is on the boards, and several interesting suggestions are put forward by readers of the U.S. papers. One idea appears to be to hold a race in each State on a course of six to twelve miles, including a "long" hill. It is proposed to have no fewer than five classes (sidecars, heavy solos, mediumweights, lightweights, and "specials"). Presumably, the winners of the State races would meet to find the winner of the trophy.

Events of this character no doubt would stimulate interest during the whole of the summer season, and would give a greater number a chance to participate than in a single event.

An alternative suggestion is to hold a single race more on the lines of the International T.T., and a part of the Lincoln Highway is mentioned as a suitable course. Standard machines are favoured by the majority of the T.T. enthusiasts, who would bar eight-valve motors and other special racing machines.

The guard, saddle, and carrier removed to reveal the details of the Warner device.

The Warner spring frame attachment.

bushes, and are similarly attached to the rigid stays. Besides their two main connections, the two links are also connected by a bolt which forms a bridge, placed midway between the yoke and the rigid stays. On this bridge is fixed a spring, the top of which is adjustably fixed to the frame members. This is adjustable, and by means of a finger on the lower rigid stay it is possible to ascertain whether the tension is correct for various

THE BRITISH GOVERNMENT

during the war claimed the whole output of our works and enforced on us the renunciation of our extensive relations with the French and Italian Governments. The performance of

THE TRUSTY

TRIUMPH

under strenuous active service conditions proved to our authorities that the TRIUMPH could be relied on to get there despite the wrecked roads, bad weather, and many handicaps of war-worn country.

Its easy start and quick get-away made it pre-eminently a machine for despatch running, while its bursts of speed and reserve power were certainly instrumental in saving the lives of our D.R.'s.

Our new models will retain all the merits of the war model, and be built to stand the same strenuous tests.

Nearly 2,000 Triumph agents in the British Isles are at your service. Why not have a chat with your nearest? He can give you all particulars and prices.

HERMES (Mercury)

HERMES, the god of merchandise and the messenger of the gods, according to Greek mythology, would also be the guardian deity of Motor Transport had such existed in those distant ages. He was the personification of rapidity of movement, and that is what the motor stands for to-day. The modern association with

WOOD - MILNE TYRES

will appeal to all motorists. On the Allied fronts these tyres have established a unique record and played a big part in the rapidity of movement, so essential to our victory. And in the Peace activities on which we are entering, car owners desirous of efficient service will find them the ideal tyre equipment.

3 1/2 H.P. TWIN HUMBER.

"REVS." AND THE SINGLE.

The Engine Speeds of Record Breakers on the Track.

THAT mystic symbol "r.p.m." does not always mean power. Because an engine is capable of high speeds, it is not necessarily a powerful one. The small internal combustion engine such as is used on a motor cycle depends upon its speed, it is true, but the limit of maximum power is reached before the maximum speed is attained. Hence "revs." do not always mean power, because most engines capable of, say, 5,000 r.p.m. reach their maximum power at a little over 3,000 r.p.m., after which the power falls off rapidly; in fact, the power at 3,000 r.p.m. may be 100% higher than at 5,000 r.p.m.

Should an engine on the track attain a higher revolution speed than that at which it gives its maximum power, this is proof that it is under-geared, the ideal ratio being that which will allow the engine to reach the speed which has been proved to be the top of the power curve, but not to exceed it.

One Advantage of the Flat Twin.

The ability to "rev." is cited as one of the greatest advantages of the flat twin. It is clear that the better mechanical balance of this engine allows of a higher rate of revolution, but, unless this high speed can be used to advantage, the rider gains nothing so far as power is concerned.

Certain it is, there is a limit beyond which poppet valves will not function properly. According to some authorities this limit is reached between 3,800 and 4,000 r.p.m.; hence one of the main reasons why the power curve falls off long before the maximum "revs." are obtained.

It is well known that a single-cylinder will develop more power than a number of smaller cylinders totalling the same capacity, because of the losses in friction and thermal efficiency, and it would appear that, until the higher revving ability of the flat twin can be used to full advantage, the single is bound to hold its present position both as the power unit of a general utility machine and as the propellant for the speed machine.

The power curves of 1914 and 1915 single-cylinder Harley-Davidson 4 h.p. models with 84.1 x 101.6 mm. cylinder, 564.9 c.c. capacity.

Although the flat twin is a higher revving engine than the single, the latter is capable of very high speeds, as has been frequently proved "on the bench," in which connection it may surprise the average reader to know that our greatest racing exponents

and tuners do not attach such great importance to bench tests as is generally supposed. I am told that many engines which beat all records "on the bench" prove inferior on the track to engines which have not given such good results on the dynamometer.

After all, it is in actual performance on the road or track where the real merit of an engine is demonstrated; therefore, the number of revolutions attained

A "graph" prepared by Mr. G. Funck, A.M.I.A.E., to show h.p. at various mean effective pressures.

on the track by engines of record-breaking machines is of far greater importance than the maximum revs. obtained on the bench, but, undoubtedly, both are interesting.

The gear ratio used on the Norton by O'Donovan during his last record, when he covered a kilo. at a speed of nearly 83 m.p.h., was $3\frac{1}{16}$ to 1. This gives an engine of 4,000 r.p.m. It may be assumed that, running under the more ideal conditions of a bench test, the revs. would jump up considerably, and that over 5,000 r.p.m. would be obtained.

Particulars regarding the highest revs. attained by the $3\frac{1}{2}$ h.p. Norton engine running free are not obtainable, but, under load on the track, Mr. Norton tells me that 4,200 has been attained very frequently, without allowing for belt slip or wheel spinning. The power developed at this speed, at which the peak of the curve is reached, is approximately 16 h.p.

High "Revs." with Sidecar.

The larger Norton engine will reach a similar number of revs. under load, but the power curve begins to fall just a little earlier. 3,880 r.p.m., without allowing for belt and wheel slip, has been obtained with a sidecar, over an officially timed distance at a flexibility hill-climb, which called for a fast run with a 6 to 1 gear. The speed was 49.8 m.p.h. I

"Revs." and the Single.—

recall that a $3\frac{1}{2}$ h.p. Triumph with sidecar, tuned for a "speed burst," actually maintained a speed of 70 m.p.h. for a quarter of a mile, with and against the wind. The gear ratio was $5\frac{1}{2}$ to 1. Therefore,

The power curve of the 500 c.c. Rudge single.

the engine speed was 4,980 r.p.m. This particular machine was a Stanley-tuned Triumph, used by J. Cocker. These speeds were obtained during comparatively short periods, but the hour records obtained by Stanley in 1913 show that singles are capable of high revs. for longer runs.

For example, the hour record for engines not exceeding 350 c.c. is still held by a Singer single, having a bore and stroke of 75×79 mm. respectively. This little machine covered 62 miles 1,199 yards in the hour (62.68 m.p.h.), which represented an average engine speed of 3,950 r.p.m., as the gear ratio was $4\frac{7}{8}$ to 1.

It is interesting to compare some of the speeds of the various types of engines which hold or have held records in this class, and for this purpose the following schedule is appended:

DOUGLAS (flat twin)	Flying km.	30.8 secs.	72.63 m.p.h.
SINGER (single)	1 hour	62 mls. 1,199 yds.	62.68 m.p.h.
NUT-J.A.P. (V twin)	100 miles	1h. 36m. 7s.	62.42 m.p.h.
MARTIN-J.A.P. (single)	Flying km.	32.76 secs.	68.28 m.p.h.

True, the flat twin scores with a half-minute run at 72.63 m.p.h., but one can better compare the respective performances of the V twin and the single in the longer runs. The flat twin does not hold any long duration records, whereas the single and the V twin, both artificially balanced as compared with the flat twin, kept up their revs. for an hour and an hour and a half respectively.

350 c.c.—5,000 r.p.m.—13 h.p.

The gear ratio used by Bailey on the Douglas when he broke the flying km. record is not available, but on test the engine proved to be capable of 6,500 r.p.m., the peak of the curve being in the neighbourhood of 5,000 when the power developed was said to be about 13 h.p. This particular engine was a special racing Douglas fitted with steel cylinders made by the A.B.C. company.

In the 500 c.c. class no V twins have held important records, and at the present time the single-cylinder holds all of them. For a short time the A.B.C. held the flying kilo. and the flying mile, but these were quickly recaptured by a Norton single. In this class we have more particulars concerning gear ratios, and,

consequently, engine speeds also. Below are given some of the record speeds, together with the gear ratios:

NORTON (single)	Flying km.	82.85 m.p.h.	$3\frac{1}{4}$ to 1	4,000 r.p.m.
A.B.C. (flat twin)	Flying km.	80.47 m.p.h.	$3\frac{3}{4}$ to 1	3,770 r.p.m.
SINGER (single)	1 hour	67.44 m.p.h.	$3\frac{1}{2}$ to 1	3,120 r.p.m.

From the above it will be seen that in the 500 c.c. class, under record-breaking loads, the single's revs. were higher than those of the flat twin.

What are the highest speeds attained by a reciprocating engine of the motor cycle type is not on record, but it is stated that the 250 c.c. A.B.C. running light attained a speed of 8,000 r.p.m., and this it seems would probably be the world's record. On test this little engine, which weighed 14 lb. without magneto and carburetter, developed 2 h.p. at 2,000 r.p.m., 3 h.p. at 3,000 r.p.m., and 4 h.p. at 4,000 r.p.m. That 5 h.p. was not obtained at 5,000 revs. goes to show that the peak of the power curve was somewhere in the neighbourhood of 4,000 r.p.m., hence the revs. above this speed only served to demonstrate the perfect balance of the small flat twin.

500 c.c.—3,700 r.p.m.—10 h.p.

Perhaps the nearest approach to the revs. obtained by the little A.B.C. of which definite information is available was that obtained by Messrs. F. E. Baker, Ltd., with a certain Precision single, which attained 6,000 r.p.m. on the test bench, but the top of the power curve was 3,700, while a Green-Precision single developed slightly more power, *i.e.*, 10 h.p., at much lower speeds.

The highest recorded revs. of a Rudge 500 c.c. single were 5,000 r.p.m., when the power at the peak of the curve (3,600 r.p.m.) was 10.9 h.p. According to a Rudge publication, the 750 c.c. single has attained a speed of 4,000 r.p.m.

To summarise, it is permissible to conjecture that the maximum speed at which any internal combustion engine will give power proportionate to the revs. is in the neighbourhood of 5,000 r.p.m., and that only the flat twin has been able to do this owing to its superior balance. It has yet to be proved, however, which type of engine is best able to maintain its speed and power for long periods. At the present time the single leads on the point of records, and no doubt there will be keen contest between these two types in the future.

VEDETTE.

UNSIGHTLY ADVERTISEMENT HOARDINGS.

The Derry House, Wolston, Warwickshire, a landmark known to thousands of motor cyclists. Several manufacturers advise us with regret that this quaint little cottage may shortly be disfigured with hoardings—a regrettable act in view of the constant appeals to improve our villages and preserve the beauty of the landscape.

VALUE FOR MONEY

10/- ANNUAL
SUBSCRIPTION TO THE **A.C.U.**

brings you the following **FREE** Benefits:

FREE "GET-YOU-HOME" SCHEME, whereby in case of accident or breakdown on the road your machine is taken to the nearest garage and a car is placed at your disposal to drive you and your passenger home or to the nearest Railway Station, FREE Legal Advice and Defence on all matters motorcycling, FREE Assistance of the R.A.C. Road Guides, FREE Use of a Reading Room at the R.A.C., FREE Assistance in Touring and Foreign Travel, SPECIAL INSURANCE FACILITIES, etc., etc.

The Auto-Cycle Union is recognised as the champion of every cause which has the welfare of motorcycling interests at heart, and the annual membership subscription of 10/- is in no sense proportionate to the numerous practical advantages the member derives. A.C.U. members are entitled to Special Benefits which cannot be obtained from any other motorcycling association, and it is in the direct interest of every motorcyclist to join the A.C.U. without delay.

ROAD IMPRESSIONS of the NEW A.B.C.

By B.H. DAVIES

J. L. Emerson—who broke records on A.B.C. machines before the war—riding the new model up Box Hill.

A Lightweight which in its Performance will Rival a Heavy High-powered Machine.

VERY seldom does the jaded journalist, who is perpetually sampling new machines on the road, encounter a mount which impresses him as fundamentally "different" from the ordinary run of motor cycles. I have had several such experiences—the first $2\frac{3}{4}$ h.p. Triumph, with its engine built into the frame instead of gummed on: the original Douglas, the pioneer of flat twins: the Scott: the 1914 A.B.C. with its perfect springing. Last Thursday I marked down a fresh milestone on the road of progress after I had sampled the paces of the 1919 3 h.p. A.B.C. As it is fundamentally "different," I am going to analyse its gait in some detail, but, by way of summary, I shall say that it is not a motor cycle at all: it is a two-wheeled car. Let me make this plain. When you drive a car, you forget all about your engine—if it is a good one—until you need full power on a speed burst or a freak hill. On the average pre-war motor cycle you *could not* forget the engine. But the new A.B.C. has no "period," and is silenced right down to a low hum. Unless you are an engineer, you forget it is there: and you float along the road, conscious rather of motion than of the mechanism which is responsible for the motion. These psychological effects are due to several detail excellences, which are emphasised later in these notes—the absence of any effort to balance or steer, the car-like insulation, as well as the smooth quietness of the engine.

The second dent which the machine made in my brain was due to its lightness. When I read the specification in last week's *Motor Cycle*, and saw the weight given as 175 lb., I grinned an unbelieving grin. But I was wrong. The machine is far and away the lightest complete specification I have ever handled. It is a cross-breed between the Morris-Oxford light car and J. S. Holroyd's famous $1\frac{1}{4}$ h.p. Motosacoche. I do not know how to put its *nuances* better than that. I have previously bestridden a few (a very few) machines which felt more like cars than motor bicycles:

but I can say without hesitation that I never tackled one which was not a welter-weight: and this is a high-bred bantam.

Powers of Acceleration.

A *game* bantam, I ought to have said. A fear-nothing last ditcher. Let me particularise. Between ourselves I have known the engine—or its first cousin—for years, seen the tiny fellows revving incredibly as they operated blowers or dynamos for the W.O. So I knew it could rev, and I knew it could *keep* cool. But my colleague "Ixion" is always wringing his grimy hands over flat twins, because he says that they either rev or tug a high gear: but that one and the same sample never does both. Well, he is wrong. The gear ratios of this fellow are 5.2, 7, 10.25, and 13.5.

First I tested the acceleration on the $10\frac{1}{2}$ gear, and nearly did a back loop over the carrier. Nothing to be amazed at in this—most flat twins can "jump" if you slam the throttle open on a 10 to 1 gear, though this engine does it on the gilt-edged scale—*à la* four-cylinder Henderson: you must not be rash in giving it gas with one hand on the bar. Next, at about 20 m.p.h., I changed up rather suddenly on to the 7 gear. "Now she's going to be sticky!" I prophesied. Not a bit of it. I got another terrific "jump," and the Brooklands D.F.P. just astern had to hustle itself to keep in touch with my dust. This shook my cynicism. I slowed back to 20 m.p.h., put in the 5.2 gear, and slammed everything on again. Ye gods! I had no speedometer, so I cannot be precise. I should estimate the machine was up to 55 m.p.h. in a very brief patch, and the helmsman of an Alpine Rolls ahead confirmed the guess. Well, I knew what "Ixion's" next croak would be, and the hilly, twisty streets of Leatherhead were not far off. I got the engine as hot as I could by some crazy sprints on bottom and second: then I put on top gear, and

Road Impressions of the New A.B.C.—

tackled the winding slopes at a positive creep with the throttle shut right down. The game little bantam burbled manfully up. So here we have a tiny flat twin which can be driven on the throttle instead of on the gear lever, which can rev, accelerate, and slow climb on all its gears, and has a range of approximately 10-60 m.p.h. on top. Good enough, eh?

An Unrehearsed Test.

It is an insult to ask whether the machine can climb. I estimate it can haul a sidecar up any main road hill. I saw Jack Emerson drive it on third gear up the steep grass slope of Box Hill behind the Burford Bridge Hotel. He tried and tried to get the back tyre to bite on another grass slope and on a wet chalk path, both graded at quite 1 in 3: but the moisture was against him. Incidentally, he made a comically unpremeditated test of what the man in the street considers (quite falsely) to be a snag in this machine. Emerson was trying to climb a greasy chalk path with a grade of 1 in 3 or worse. The path resembled a trench after a bombardment, and the tyre would not bite on the wet chalk. So we lifted the machine out of the trench and Emerson made a clutch start in the grass of the parapet. Suddenly his tyre bit and chucked Emerson and the jigger down into the trench. Machine and rider rolled over and over, and the wet chalk faithfully marked every point of contact for identification purposes. Nothing was bent or dented, and not one solitary portion of the power unit was even touched.

The machine I rode is one of the hand-made experimental batch—not a Sopwith production mount: and a number of oddments are still under attention. The slow running is to be perfected. A stop is to be added to the clutch. Experiments are to be made with stiffer springs for heavy riders. But I have no hesitation in saying that if the production machines are no better than the sample I tested, they will nevertheless create a *furor*. A genuinely powerful, genuinely comfortable, high-speed touring mount at 175 lb. is a welcome novelty.

The Latest in Lubrication.

Turning to features of less novelty, I think the lubrication and the springing represent the chief interests. We have had plenty of motor cycle engines with automatic lubrication, though we have not before had one which can do 1,500 miles on one filling: and, generally speaking, the more automatic a lubrication system has been the shorter the life of the bearings,

because small, overloaded, phosphor-bronze bushes demand more than lubrication—they insist on oil-cooling. But here we have a hot-stuff engine which receives no fresh oil for a month of hard riding in summer (the pump circulates the whole supply once every three minutes). How will it stand up? Only time can show, but I have no doubts. I maltreated the little engine shamelessly, but I could not wring a conk or even a warm smell from it. The secret is obvious. The vital bearings are all either rollers or ball. Both types actually run best in a *dry* state theoretically. They are lubricated in practice as a preventive against rust, which is their deadliest enemy; in no other way can you keep moisture away from them.

Springing and its Limitations.

As regards the springing, I must differentiate between ordinary roads and very bad roads. On normal surfaces, good, bad, or indifferent, the idea of springs simply does not occur to you. With a spring fork and a rigid main frame, one is perpetually thinking, "Quite a good fork, this!" or "Ugh! that was some pot-hole," or "They have remade this road." On the little A.B.C. the normal motion is so smooth that the speed or the scenery absorbs attention, and such things as road and springs pass into oblivion. But on a really bad road the spell is undoubtedly broken. For example, there are 6in. pot-holes on the road from Hersham to Esher, which the River Mole floods at intervals; and the springing cannot damp out such holes as these. I doubt whether any springing could, for even the back axle of a Rolls thumps horribly over them. I am loth to quote this as a criticism on the machine, for I do not dream that any vehicles can float over such atrocious going.

Control is extremely simple. The gear box works as silently as on any £1,000 car. The two hub brakes are smooth and powerful. The clutch (under left grip) has ample leverage. The ignition may be left fully advanced all day. The throttle lever has rather too big an arc to be convenient for finger range, but is, of course, preferable to two levers. The steering is quite admirably planned: I did my best to provoke a "speedman's wobble," but could not get it.

Altogether, the firm is to be congratulated at having stepped right into the front rank at the first attempt, and that, with a machine of comprehensive originality, with no plagiarism from the successes of the older competitors. If the new A.B.C. proves as durable as it is unquestionably superfine, a magnificent future awaits it.

[A detailed and fully illustrated description of the A.B.C. appeared in last week's issue. —Ed.]

The writer astride the new 3 h.p. A.B.C.

North Middlesex Wireless Club.

As most members of the above club are motor cyclists, Mr. E. M. Savage, the hon. secretary, asks us to invite old members to communicate with him at Nithsdale, Eversley Park Road, Winchmore Hill, N.21.

Essex M.C.

At the annual general meeting, recently held, it was decided that a dinner should be arranged as soon as possible, and this will be held either the last Saturday in March or the first Saturday in April. The time and place will be announced later. All members on the books at August, 1914, who have served in His Majesty's Forces will receive a free invitation. The opening run will take place on April 13th; the venue will be announced in due course. It has been decided that advantage shall be taken of affiliating members to the A.C.U. The hon. secretary, Mr. D. S. Kapadia, Algers Road, Loughton, Essex, will be pleased to hear from intending members.

York and District M.C.C.

At the first committee meeting held recently the following events were fixed: April 9th, opening run to Farndale, tea at Kirby Moorside; April 21st, run to Fountains Abbey; May 7th, slow hill-climb at Garroby; May 17th, paper-chase; May 21st, reliability trial, Greenhow climb, etc.; June 7th, help London-Edinburgh Trial at York; Whit-Monday, June 9th, run to Scarborough; Wednesday, June 25th, Garroby hill-climb; Saturday, June 28th, run to Bridlington.

Coventry and Warwickshire M.C.

A special meeting of the committee was held at 19, Hertford Street, Coventry, on March 11th, when a preliminary list of fixtures for club members was drawn up for 1919. Mr. M. F. W. Sampson was elected honorary secretary. It is not proposed to hold any open events this year, but a strong social and sporting programme will be submitted for approval at the annual general meeting for the benefit of members only. The annual general meeting was fixed for March 28th at "The Towers," Warwick Road, Coventry, at 8 p.m., when it is hoped that a large attendance of members and prospective members will meet. The entrance fee is abolished for the first fifty new members, and the annual subscription has been fixed at 10s. for all members.

The opening run will take place on Saturday, April 5th, when a speed judging competition will be held on a circular course. Forms of membership may be obtained from the hon. secretary, 19, Hertford Street, Coventry.

Future Events.

- Mar. 22.—A.C.U. General Meeting, Digbeth Institute, Birmingham.
 Mar. 22.—N.M.C.F.U., Coventry. Run to Birmingham to attend A.C.U. Meeting.
 Mar. 23.—Woolwich, Plumstead, and District M.C. Run to Winchelsea Camp.
 Mar. 23.—N.M.C.F.U., Sheffield. Run to Castleton.
 Mar. 23.—N.M.C.F.U., Leeds. Run to York and Harrogate.
 Mar. 27.—N.M.C.F.U., Leeds. Whist Drive and Dance.
 Mar. 30.—N.M.C.F.U., Sheffield. Run to Matlock.
 Mar. 30.—Woolwich, Plumstead, and District M.C. Hill-climb.
 April 5.—Birmingham M.C.C. Opening Run to Stratford-on-Avon.
 April 6.—The M.C.C. Opening Run to Hatfield.
 April 6.—Woolwich, Plumstead, and District M.C. Non-stop Trial from Knockholt to Lamberhurst and Back.
 April 9.—York and District M.C. Opening Run to Farndale.
 April 13.—Liverpool M.C. Opening Run.
 April 13.—Essex M.C. Opening Run.
 April 18.—Darlington B. and M.C. Opening Run.
 April 21.—Birmingham M.C.C. Open Reliability Trial for Victory Cup.
 April 21.—Dublin M.C.C. Dunlop Cup Trial.
 April 21.—York and District M.C. Easter Run to Fountains Abbey.
 May 3.—Birmingham M.C.C. Social Tour.
 May 4.—N.M.C.F.U., Sheffield. Reliability Run to Knutsford.
 May 7.—York and District M.C. Slow Hill-climb at Garroby.
 May 17.—York and District M.C. Paper-chase.
 May 21.—York and District M.C. Reliability Trial.
 May 24.—Birmingham M.C.C. Social Touring Trial. Week-end to Llangollen.
 June 9.—Dublin M.C.C. Whit-Monday Trial.
 June (end of).—Dublin M.C.C. Twenty-four Hours' Reliability Trial.
 Aug. 2 and 4.—Dublin M.C.C. Trial.

The B.M.C.R.C.

At the recent meeting of the committee of the British Motor Cycle Racing Club it was decided to pursue a vigorous programme for 1919. It was determined not to wait until Brooklands track was repaired, but in the event of this not being done during the summer, efforts would be made to hold speed trials elsewhere, at such places as Rhyl, Bournemouth, Southend, and Doncaster.

Hull M.C.C.

Mr. Fred Hall, 1, Margaret Street, Hull, is working energetically to organise this club, and invites all motor cyclists in the Hull district who are interested to call upon him any day between 9 a.m. and 7.30 p.m. Mr. Hall hopes to call a meeting shortly.

Abersychan (Mon.) M.C.C.

At a meeting of motor cyclists held at Abersychan on March 8th it was decided to form a motor cycle club. Mr. W. H. Oliver, Crown House, Abersychan, who was appointed hon. secretary *pro tem.*, will be pleased to hear from any motor cyclists in the district who are interested in the movement.

Woolwich, Plumstead, and District M.C.

A preliminary fixture list has been arranged, which includes a hill-climb on the 30th of this month an Easter tour to N. Wales, fifty miles non-stop trial, also in April, open trial for Matchless cup in May, team trial in June, inter-team trial in August, etc. The secretary is Mr. F. J. Ellis, 3, Nightingale Place, Woolwich, S.E.18.

The Motor Cycling Club.

An excellent programme has been arranged for the M.C.C. concert, which is to take place at 7.30 to-morrow (Friday) evening, at the large Queen's Hall. Tickets are free, and may be obtained from the secretary, Mr. Southcomb May, 15, Endsleigh Gardens, London, N.W.1., or from the Editor, *The Motor Cycle*, 20, Tudor Street, London, E.C.4. Ladies are invited. The seating accommodation will be upstairs, and also in the central hall, at tables seating eight or twelve people. Visitors are requested to come early so as to find accommodation. It may also be mentioned that invitations are extended not only to members of the M.C.C., but to other clubs and all those interested in the pastime. A collection will be made during the evening for St. Dunstan's Hostel.

Birmingham M.C.C.

At the last committee meeting a provisional list of fixtures was arranged for 1919. The committee are anxious to make club life more attractive to the average motor cyclist, and with this object in view are arranging for more social tours than usual.

Competitions commence with the opening run, which is fixed for April 5th, to Stratford-on-Avon. All motor cyclists (members or otherwise) are invited to attend this event. A speed-judging test will be coupled with this run, for which medals will be awarded. Hon. sec., W. H. Egginton, 76, Earlsbury Gardens, Birchfields, Birmingham.

SALE OF 200 ARMY MOTOR CYCLES.

A RECORD sale of surplus Army motor cycles, over 200 in number, was held by Aldridges (Messrs. W. and S. Freeman), St. Martin's Lane, London, W.C.2, at the Gilbey Hall, Barford Street entrance, adjoining the Royal Agricultural Hall, Islington, beginning at 10.30 on Friday morning last. The sale continued right through the day without a break, and was not concluded until 6.30 in the evening. Two auctioneers conducted the proceedings in turn from a car in the centre of the hall.

All the motor cycles sold were of makes not standard with the Government, and consisted of Scott, Zenith, Humber, Lea-Francis, Indian, Matchless, Chater-Lea, Ariel, N.U.T., New Hudson, L.M.C., Griffon, Rex, Calthorpe, N.S.U., Motosacoche, Bat, James, Premier, Rover, Rudge, A.J.S., Campion, Regal, Excelsior, Royal Enfield, Singer, and Bradbury.

The first batch of machines consisted of twenty Scott motor cycles and sidecars, which ranged from 22 guineas to 41 guineas. The machine sold at the last named price had flat tyres, no filler cap to the petrol tank, the top of the radiator dented, and the front mudguard patched. Most of the machines were suffering badly from rust and neglect, and many had important parts missing. A Zenith which fetched 35 guineas had the back mudguard worn through, a badly worn gear lever, and was, generally speaking, in very far from first-class condition. The highest priced Zenith fetched 36 guineas. One, sold at 16½ guineas, was in a terrible state. The magneto chain case and magneto platform had been bent nearly at right angles, the front forks were twisted, and there was no front wheel. Its companion, which sold for 17½ guineas, had no back wheel, and was in a deplorable condition.

Of the Humbers sold, the highest price was 27 guineas, while the highest priced Lea-Francis went at 30 guineas. One of these popular machines, sold for 16½ guineas, had no carburetter, no saddle, and no gear box. An Indian motor cycle and sidecar was sold for 70 guineas—the highest price reached.

The final batch of motor cycles, 148 in number, all commanded good prices, and even discarded frames of such makes as Matchless, Ariel, etc., were sold at quite a respectable figure. The highest priced Ariel fetched 34 guineas, the best N.U.T. £28 8s. The New Hudsons ranged from £9 19s. 6d. to £36 15s. A Griffon motor cycle frame went for £5. Even the two German N.S.U.'s went by no

Lot 21. A 3½ h.p. New Hudson in very poor condition.

means at bargain prices, fetching 16 guineas and £8 18s. 6d. The single Motosacoche went for £22 7s., and the best Bat for £21. Next followed a large batch of Scotts, and for these the best price was £32 11s.

As regards high prices, two of the many Premiers went for 30 guineas and two for 32 guineas, while some of the Rovers fetched 21 guineas, 24 guineas, 28 guineas, and 30 guineas. One of the A.J.S.'s was sold for the exceptionally good figure of 47 guineas, and an Enfield made 32 guineas. A Singer motor cycle fetched 25 guineas, a Rudge 26 guineas, and a Bradbury 45 guineas.

A Scott and an Indian which sold for 22 and 70 guineas respectively.

“GOING LIKE A BIG 8”

“FRANK MELLOR, on his little $2\frac{3}{4}$ 'DOUGLAS,' did a fine ride. His average indeed was wonderful.” Such is the report of ‘Motor Cycling’ on the TEN mile INDIAN handicap, held at SYDNEY’S Big Carnival. For FOUR years the little “DOUGLAS” has been too busily engaged to worry about sport and competitions. Its first appearance under PEACE conditions in SYDNEY, proved beyond doubt that not only is it capable of retaining its position in its own class but of whacking the bigger machines in larger classes, for it obtained TWO—first, ONE—second, and a third at this meeting, even after the handicappers had penalised it to the extent of conceding start to much larger-powered machines.

Register your name and address with Department “B” for our “1919 PEACE Programme,” which will be issued in the course of a few weeks.

Sports Model.

The theoretical object of twin-cylinders—i.e., additional power with smooth running—is not always attained; but when such does transpire, it is at the expense of the simplicity and economy of the single. The problem of smooth power production, combined with low maintenance cost, petrol economy, wonderful speed, and hill-climbing capabilities, has been solved in the Norton simple single. Hence our post-war programme is 'SINGLES ONLY.'

Utility Model.

ROAD REPORTS.

SCOTLAND.

THE ferry between Grantown and Burntisland will commence running on April 1st. This will save motor cyclists going round by Stirling to get to the North of Scotland. Another route, of course, is *via* Queensferry.

Edinburgh-Stirling.—Very good to Lauriston, thence to Stirling very bad, and in some cases positively dangerous for solo riding.

The road to Airth is excellent as regards surface to within five miles of Stirling, where the road has been badly cut up by Admiralty operations.

Edinburgh to Peebles.—Road excellent.

Peebles to Selkirk.—Excellent except for one or two short stretches.

Galashiels to Edinburgh.—Very good, but badly cut up in places.

SOUTH WALES.

Swansea-Cardiff road.—Generally good, parts very good. Tramlines in Neath and Briton Ferry require care when riding solo. Outskirts of Cardiff bumpy.

Swansea to Brecon and Hereford road.—Very bad as far as Ystalyfera, owing to 'bus and commercial traffic. Fairly good second-class road from Ystradgynlais to Sennybridge over Bwlch. Good condition from Sennybridge to Brecon and Hereford except some short patches where timber hauling has been in progress during the winter months.

THE MABON ADJUSTABLE PULLEY.

EVEN in these days of change speed gears the adjustable pulley is still a useful, if not an almost indispensable, adjunct to the belt-driven motor cycle, as it enables the whole range of gear ratios to be altered to suit the conditions under which the rider is travelling.

The particular pulley under consideration is the design of Mr. A. Mabon, who has been responsible for the introduction of many devices in connection with the pastime which have been of great utility. Mr. Mabon has built his own engine, was the inventor of an ingenious plate clutch fitted to the engine-shaft, and of the Mabon variable pulley gear, besides numerous other contrivances.

The illustration shows the pulley in the

The Mabon adjustable pulley.

highest and lowest gear positions. The pulley works in the following manner: On the boss forming part of the inner flange are three studs placed at equal intervals, which engage in any one of the five recesses, of which there are three sets. To alter the gear, it is only necessary to remove the belt, push the movable flange inwards, and turn it so that the recess giving the particular gear required is engaged. It would be necessary, we should imagine, to keep the boss, on which the flange slides, well greased. The pulley may be obtained from Mr. A. Mabon, Woodside Gardens, Bruce Grove, Tottenham.

A PECULIAR MACHINE OF ENEMY DESIGN.

THE strange looking motor cycle here illustrated is a German effort in design. The attachment at the side is a kind of bath-chair seat, and from this the machine is steered by a tiller, which incorporates a magneto cut-out, operated by twisting the shovel-handle grip. All the other controls are attached to various parts of the tank.

The engine is nominally of 3½ h.p. with the inlet valve in the overhead position. A long tappet rod which operates this valve is taken through the induction pipe with great disregard for the latter's essential air-tightness.

A belt-cum-chain driven machine of German manufacture captured by our Forces in Mesopotamia.

Ignition is by low-tension magneto, which is fitted to the underside of the bottom bracket in an inverted position. In place of the usual spark plug a mechanical make-and-break projects into the cylinder, and is operated by the piston striking a cranked lever.

Splash lubrication is used, the extension arm for operating the pump lying along the top tube. Means of cooling the engine while stationary are provided by a fan attached to the engine pulley which forces air up a metal cowl arrangement against the fins. 24in. wheels are fitted, with front and rear brakes of the contracting band type.

Transmission is by 1in. belt from the 6in. engine pulley to the countershaft clutch pulley, which is 10in. in diameter. The final drive is by exposed roller chain running on fourteen tooth and fifty-six tooth sprockets respectively. Levers on the tank operate the valve of the car type carburetter and the clutch lever.

We are indebted to Lt. W. B. Smith, A.S.C. (M.T.) for the photograph and particulars.

IMPROVING THE OVERALL.

RIDERS whose footrests are not completely guarded from mud will find a device similar to that illustrated below quite invaluable. It is simply a toe-cap of leather made to fit the boot, and stitched on the existing overall. The sole of the toe-cap is of strong sole

An improvement to the conventional overall devised by Mr. V. A. Holroyd.

leather, the sides being stiffened by a lighter weight strip of the same material. This keeps the part of the overall covering the instep securely in contact, and prevents ingress of water and mud into the lace-holes. Mr. V. A. Holroyd, of Messrs. Rudge-Whitworth, Ltd., has treated his overalls in this manner, and submitted them for our inspection. It is unquestionably an improvement on the usual type of overall.

AN AUSTRALIAN CLUB RACE MEET.

SEVERAL local records were made at the beginning of this year by members of the Motor Cycle Club of South Australia. The races, which occupied two days, were held on Sellick's Beach, the surface of which was perfect, and a slight wind favoured the riders.

On the first day a mile handicap was run off, with the following result:

1. A. V. Smith (Excelsior), handicap 6s.
2. E. Ferguson (Indian), 1s.
3. W. H. Hubbard (O.H. Wyatt-Jap sc.), 17s.

A mile solo and a mile standard touring passenger races were held over a measured mile, and electrically timed. The results are tabulated below:

SOLO: CLASS 1, up to 300 c.c.

- | | |
|---------------------------------------|--------|
| | m.p.h. |
| 1. E. Warren (Elliott-Villiers) 76s.* | 47.37 |
| 2. F. G. Rong (Victor) ... | 82½s. |
| 3. J. Wells (Victor) ... | 91½s. |

CLASS 2, 301-350 c.c.

- | | |
|--------------------------------|--------------|
| 1. A. McKee (Kent) ... | 60½s.* 59.40 |
| 2. C. S. Lindsay (Douglas) ... | 62½s. |

CLASS 3, 351-600 c.c.

- | | |
|--------------------------------|-------------|
| 1. D. Cameron (Norton) ... | 56s.* 64.28 |
| 2. H. Hirtle (J.A.P. twin) ... | 56½s. |

CLASS 4, over 600 c.c.

- | | |
|------------------------------------|--------------|
| 1. E. Ferguson (Indian) ... | 38½s.* 93.76 |

| 2. E. Ferguson (Indian sc.) ... | 52½s. |
| 3. P. J. Coe (Indian sc.) ... | 56½s. |

*Local records.

THE MOTOR CYCLE AND THE INDUSTRY, AS SEEN BY "THE TIMES."

BY THE WRITER OF "THE TIMES" ARTICLE.

Recently we took exception to certain statements in an article in "The Times." The writer of this article now replies to our criticism. Further editorial comment is given on the next page.

I AM very glad indeed to see that *The Motor Cycle* of February 6th, in spite of disagreeing with some of my statements, has done me the honour of quoting quite a nice little bit from an article of mine in *The Times*. Had I not been ill in the meantime, I would have taken an earlier opportunity of replying to the criticism which has been applied to my strictures.

"The motor cycle is abominably and unnecessarily noisy," I wrote. I shall have no hesitation in re-expressing the same sentiment over and over again, until it begins to be borne in upon the motor cycle rider and the motor cycle manufacturer that such, in the great majority of cases, is an easily demonstrable fact. Anyone who lives as I do, on one of the great roads leading out of London, knows this perfectly well; frequently in the otherwise silent night his sense of hearing is made acutely aware of it. I used the adverbs in question because they represent my considered and restrained opinion, which, in view of the fact that I have ridden and owned a large number of machines from 1901 up till the present day, is not by any means that of one who is in any way opposed to motor cycling. On the contrary, in other articles in *The Times*, I have expatiated upon the virtues of the motor cycle and endeavoured to reflect my own enthusiasm for it as a means of transport, both for business and pleasure, but because I am alive to its many virtues is surely no reason at all why I should shut my eyes to its vices. Did I do so I should certainly fail in my duty as a critic with the avowed intention of writing for the education of the public, and for the encouragement and, when necessary, the castigation of the motoring industry. If I can draw attention to the needless and deplorable noisiness of the average motor cycle, it is conceivable that a rather larger number of buyers will demand a greater degree of "silence," and the usual inter-effect of supply and demand will in consequence exercise a beneficial influence.

Does Noise Mean Power?

Now I freely admit that the difficulty of thoroughly silencing a single-cylinder engine is very real, but it is by no means insuperable. It was, for instance, done quite well on the 8 h.p. Rover car many years ago (although, even in this case, it could have been done much better), and I am also prepared to admit

that in the case of the present day single-cylinder Sunbeam motor cycle, the silencing is carried out very well indeed. But this only shows that it *can* be done: it does not in the least repudiate my statement that "the (understand 'typical') motor cycle is so-and-so noisy." I grant that motor cycle manufacturers are not entirely to blame, because very frequently riders make a point of eviscerating the manufacturer's idea of a silencer, or else do away with it altogether, and attach a long open pipe, that makes a meek little twin roar away like any Brooklands racer. But it is surely the duty of the manufacturer, and a duty that he owes to the non-motor cycling public, to design silencers which do muffle the exhaust without absorbing a great deal of power. I am confident that open exhausts (fingers seem to be freely snapped at the law on this point) are used not so much because they make a noise, but because they do enable more power to be got from the engine. So long as this is the case manufacturers must bear the brunt of the blame, and the more so because even when noise is the desideratum of the rider, it is nearly always because he prefers (and I agree entirely with him) the crisp bark of the exhaust to the rattle of chains and the clatter of valve gear. By a parity of reasoning a German band is rendered quite agreeable in a boiler factory.

Engineers and—Others.

I furthermore consider that my strictures—which I am perfectly certain will be accepted by the vast majority of people, though not necessarily so by the vast majority of motor cyclists—are justified in this respect that so few determined attempts have been made by manufacturers to make any research into the cause and formation of noise and to cope with it in the light of their experimental results. When I said "the two-wheeler . . . is inclined to be the product of the cycle mechanic rather than the engineer," I had this very point of noisiness, amongst others, in mind. Engineering science, well served by a laboratory under the guidance of skilled and enterprising brains, can accomplish almost anything—it is impossible to set limitations to what can be done with present-day resources and information, leave alone those of the immediate future, and if a perfectly silent motor cycle were put on the road it would be but a small achievement alongside some of the things which have been

DEEDS, NOT WORDS.

Peterborough, 26/2/19.

To Messrs. Vivian Hardie, Ltd.

Dear Sirs,—Thanks for the little nut. 8d. herewith to settle.

May I put on record that my transaction with you over the purchase of a "Douglas" was carried through on your part on straight business lines; furthermore, you made a definite promise as to delivery and kept to it absolutely.

Probably **SOME** other firms are prepared to do as much for their would-be customers.

Certainly—I speak from recent experience—**ALL** other firms are not prepared to do as much for their would-be customers.

It seems to me that you are out to do business, not to do your customers. Yours sincerely

(Signed) Lieut. R.A.F.

The Motor Cycle and the Industry.—

done during the war. I cannot understand *The Motor Cycle* tacitly adopting the attitude that "we must not expect too much." We cannot expect too much. The more we expect—and demand—the more we shall get, and no possible good purpose can be served by what I may call the inter-linear suggestion that what we have is as good as we are entitled to have, and that any excuses are equal to explaining away the shortcomings to which one is entitled to take published exception.

As to engineers and cycle mechanics, the difference between the two is that the one is a scientist and the other is not. I do not say that all motor cycles are produced by cycle mechanics, but I do say that a great many are not produced by engineers. The mere assembling of finished engines and gear boxes, the building of wheels, and the enamelling of frames do not constitute engineering, and no one can deny that a very large number of motor cycles are produced under these conditions. But as to noise, it is notable that, with one marked exception, machines which emanate from manufacturers who have tackled the motor cycle on genuinely engineering lines are better than those which are assembled of "standard" parts.

The Motor Cycle Industry.

"Important and powerful firms are taking charge of its (the motor cycle industry's) interests." This statement *The Motor Cycle* criticises as quite unwarranted, and the reference to important and powerful firms taking charge as erroneous and unfair to the British industry.

The statement can hardly be unwarrantable, because it is literally true. In the past we have had dozens of different little manufacturers employing anything between fifty and a hundred hands and contriving to make, and catalogue, about half a dozen different models. If motor cycle manufacture is to remain a sound industry, and if Great Britain is to retain the position in it which she has won, it is quite obvious that this sort of thing "will not do." More than one important and powerful firm has perceived this, and at last motor cycles will be got out in this country on a really sound production basis. Is it not reasonable

to assume that, under the stress of competition between really big firms, with gigantic interests at stake, the progress of motor cycle design will be more rapid than ever it has been under the bad old conditions? I think so. I also think that it will be very remarkable if more than two-thirds of the firms at present making motor cycles in this country are still making them—and motor cycles only—for their living in five years' time.

EDITORIAL NOTE.

We considered it unfair to the British motor cycle manufacturer for the author to refer to him as "a cycle mechanic rather than an engineer." The statement that "this state of affairs will rapidly change now that important and powerful firms are taking charge of its (the industry's) interests" we said was erroneous and unwarranted. We did not comment upon the question of noisiness raised by *The Times*, as we fully appreciate that there is room for improvement in this direction, and have very frequently referred to the matter in *The Motor Cycle*.

The writer of *The Times* article in the foregoing appears to be under the misapprehension that we tacitly defend the motor cycle on this point. He proceeds to state that he cannot understand *The Motor Cycle* tacitly adopting the attitude that we must "not expect too much." We are content to leave it to our readers, both makers and riders, to decide whether we have ever adopted this attitude. Frequently we have been told that we have "forced the pace," but agree that but for our fifteen years' campaign in favour of more efficient machines progress would not have been so rapid.

The Times contributor now writes that "I do not say that all motor cycles are produced by cycle mechanics, but I do say that a great many of them are not produced by engineers. The mere assembling of finished engines and gear boxes do not constitute engineering."

We did not raise any question on this latter point, neither had we the "assemblers" in mind when mentioning that his statement was unwarranted. We referred to his inference that the motor cycle maker in the past was nothing more than a cycle mechanic, and that in the future "important and powerful firms were taking charge." We said the statement was erroneous and unfair to the British motor cycle industry, because the backbone of the industry to-day is the same as has been responsible for the development of the motor cycle in the past. True, one new firm has entered the field, a concern which has taken over a pre-war goodwill; otherwise the industry remains as it was before the war, with the exception that the output facilities are increased.

We would also point out that the engines and gears used are designed by specialists, who are as much engineers as any of the leading firms manufacturing throughout.

In many watersplashes the A.A. has erected posts to indicate the depth of water, and many times they have saved motor cycles and cars from being stuck in a stream that has belied its shallow appearance. The one illustrated is situated in a ford near Codicote, Herts.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle" Herford Street, Coventry, and must be accompanied by the writer's name and address

RUSTLESS STEEL.

Sir,—I am interested to see that this steel can be treated to 100 tons, and should like to know if, when so treated, it would be suitable for the same duties as B.N.D. and similar steels. I took my figure for the tensile of this steel from the Air Board specifications, and have seen a good deal of the comparative qualities of rustless and tungsten steels for exhaust valves of aero engines. As regards absence of deformation, I cannot agree with Mr. Brearley, as we had for one aero engine to use thicker heads with rustless than tungsten, owing to deformation. We also had other troubles with the rustless steel which did not occur with tungsten, so that my remarks on the comparative qualities are based upon experience.

I may say that I have also been using tungsten steel valves in a car for 3½ years.

I do not want to decry rustless steel at all, as my experience is that for all round work for exhaust valves it is as good as tungsten, but for a very hot engine I would prefer the latter. This is also the opinion of Capt. L. Aitchison, R.A.F., in his paper on exhaust valve steels, read before the British Engineering Standards Association, last June.

ERIC W. WALFORD (Capt.).

A.C.U. COMMITTEE.

Sir,—Those of us who have worked strenuously before and during the war to make the A.C.U. a great national democratic body, keenly alive to the interests of its members and determined to fight for their rights when occasion demands, cannot be other than grateful to Maj. Axford for his generous recognition of what we have achieved, as also for his very able appeal for a larger membership, and, what is even more important at the moment, for the selection of the right men to serve on the committee about to be selected.

The motor cycle movement is on the eve of a very great development. In my opinion a million motor cyclists in Great Britain is by no means an impossible number to contemplate, as soon as machines can be made in quantities to meet the demand.

If we can get the majority of them into one organisation it will indeed be a force to be reckoned with, both by politicians and profiteers, and we may expect to be strong enough effectively to resist any suggestion of unfair legislation or excessive charges, whether the latter be for petrol or any other of our needs.

We cannot succeed in making the A.C.U. as powerful as it ought to be, unless we can satisfy the provincial motor cyclists that it is, in fact, and indeed, a national body; and not one run by Londoners for Londoners. The best way of doing this is by securing the election of as many provincial members as possible to our committee, which is the Parliament of the movement.

I personally question the practicability of holding committee meetings at more than one centre, and London is certainly the most convenient centre for all parts of the kingdom, by reason of its train service from all parts. Given, however, that provincial representatives have their out-of-pocket expenses paid, as is just, I think, we ought to secure their regular attendance at our monthly meetings in London. Supplement this by the development of local branches of the A.C.U. in the more important centres and by regular "open" meetings for discussion, say, once a quarter, in each such centre, and we ought to get a virile organisation—national in the true sense of the word—working for our interests at all times. I am not sure that Mr. E. B. Ware's list of suggested candidates for election goes quite far enough in the direction indicated, and I would like to see, as you suggest, a stronger representation from the provinces, but it is "up to" the provincial clubs to secure this result, now that they have the opportunity.

Further, may I say that we need as much "new blood" as possible—keen, young, active motor cyclists. The older, staid element is fully represented, and, I hope, always will be, but it should not predominate.

Also, we must never forget that the A.C.U. is essentially a private owner's organisation, and private owners should always be in an overwhelming majority on the committee, although, in my opinion, a certain number of so-called "trade" members should also always be there, for, given the right men, they are a real source of strength and helpfulness to the committee on innumerable occasions. The committee should be representative of all sections of society and not preponderatingly of one.

May I therefore close this somewhat too lengthy letter by urging A.C.U. members everywhere not to lose this opportunity of electing a really strong fighting body of committeemen. If we older members have not done our duty, do not re-elect us. If, on the other hand, you think we have done our best, then support us; but, in any case, see that we are strengthened in the manner above suggested, and remember that the members will get just the committee they deserve to get—no better and no worse—and it will be of no use grumbling after the event.

OTTO THOMAS.

Trying the weight of the new A.B.C. A full description of this machine was given on pages 242 to 244 last week. In this issue a report of its behaviour on the road will be found on pages 275 and 276

STROKE-BORE RATIO

Sir,—It is not often I find a mistake in your paper, but in your description of the new Clyno you say that the stroke-bore ratio of 4 to 3 is the highest of any British twin. You have evidently forgotten the 5-6 h.p. Ariel, the stroke-bore ratio of which was $4\frac{1}{2}$ to 3, viz., 67×95 mm.

I owned one of these in 1914, and found it the coolest running and most powerful engine of its size that I have ever handled.

I O 685.

B.E.F.

FROZEN OIL.

Sir,—Recently I was driving on a frosty day when my machine, a Triumph, suddenly began to knock very badly indeed. Thinking I was not giving the proper amount of oil, I pumped several pumpfuls, as I thought, into the engine, but the knocking still continued and, as I was pulling a sidecar and passenger, it naturally made me very curious as to the real cause. On dismantling the cylinder, I found the crank case had very little oil in it, and the cylinder walls and piston were bone dry. When I dismantled the oil pipe I found I could get no oil through as it evidently had frozen. What I should like to hear from either an experienced engineer or rider is, what objections there could possibly be to placing the oil tank at the back, as the oil pipe would then get some little heat from the cylinder, and could enter the crank case at the back of the cylinder. It speaks well for the Triumph that the engine was none, the worse.

J. SIMPSON.

EASY STARTING.

Sir,—I have lately been using the petrol system on my two-stroke Clyno in preference to the drip feed lubrication which is fitted.

It occurred to me that I might use the now useless oil tank for petrol and use it for injections, so now when starting up from cold I simply give half a pumpful of petrol, and the machine starts as if it were thoroughly warm.

A 1915 Clyno two-stroke with hand-controlled clutch. The sidecar is a Henderson Model A featherweight. (See letter R. B. Brittain.)

I hope this tip may be of some use to your readers, as it saves slopping petrol about when starting, and is no trouble at all.

R. B. BRITTAİN.

SIDECAR BRAKES.

Sir,—It is with much disappointment I have observed the neglect of improved braking power for heavy sidecar combinations. In my opinion, no heavy outfits at present on the road are fitted with brakes enabling the driver to have absolute control on a hill of, say, 1 in 6, or to pull up really quickly on anything of a slope.

We are apparently to have better engines, spring frames, detachable wheels, etc.—all most desirable things—and yet the essential—safety—is neglected. The much-boomed post-war models of several of the biggest and most famous concerns have recently been announced, and in every case (A.B.C. alone excepted, and this is a lightweight) we are to have the same bicycle type front rim brakes. No single braked wheel, however well designed, is sufficient to hold a heavy outfit with, say, two or three passengers and luggage. The Enfield type front brake is better, but even that is insufficient.

Cannot we have a really good sidecar wheel brake? That, in combination with a good rear wheel brake, would give

adequate braking power and a sense of security now sadly lacking, and it should surely be possible to avoid the difficulties in application, which, I suppose, caused its lapse from, e.g., the Rover Co.'s specification.

If you will use your influence in this supremely important matter, you will earn a large increase in the already considerable gratitude borne towards you by

J. Birmingham.

IN DEFENCE OF THE HUB GEAR AND BELT DRIVE.

Sir,—Much may be said in favour of the countershaft gear, but one strong point in favour of the hub gear, which I have never seen advanced, is that in the case of a belt or chain-cum-belt drive it is technically correct, inasmuch as the belt is not subjected to the extra power given by a reduction of gear. [This point has been mentioned again and again in our columns.—Ed.]

It will be seen, then, that in the one case belt slip is counteracted, while in the other it is accentuated.

Now the chief fault, if not the only fault, of belt transmission is slip, which brought into being the all-chain drive, and with it the countershaft gear; and I submit that, whatever the advantages claimed by this combination, nothing can be sweeter, neater, or cleaner to handle than a belt on the final drive, and where this is used the hub gear should be retained, because the pull on the belt remains fairly constant. The countershaft lends itself better to the kick starting gear, and claims reliability in the size and strength of its gear wheels. There is no reason, however, why the hub gear should not be made substantial, and, given this, it is all that can be desired in reliability.

I submit also the advantage of a large hub in respect of spoke strain, where the wheel is driven from its centre, and that it should be considered undesirable to carry this weight directly on the wheel, instead of through the frame, does not conform with my view or experience. This I consider in its favour, and would like the experience of others, but surely the strength of a bridge is governed by the load in the centre of its span, and that same bridge is that much the stronger when the load is on its piers. Similarly, then, a bicycle frame must be stronger, or could be made lighter, if weight be carried where it counts least.

M.R.C.

Caversham.

MAKERS AND PROMPT SERVICE.

Sir,—Your correspondent "Lieut.," Leeds, in your issue of February 6th, mentions the first-class business methods of the Hendee Co. On the other hand, correspondents have complained at various times of the unbusiness-like methods of some British firms, which would give one the impression that it is a common failing. However, it is not so, for there is one firm, at least, in "Lieut's" own county, whose methods of conducting business are exemplary. I refer to the Scott Engineering Co., of Saltaire.

Though engaged, like the majority of other firms, on important Government work, they can, and have, always found time to reply to any communication, and to supply any "spare" required by return; also, they take infinite trouble to put a rider right when he has met with any little difficulty in the running or adjustment of his mount.

Having personally experienced such satisfactory service from Messrs. Scott, I think it should be more generally known that there are at least a few first-class British firms who are equal to the much-lauded American concerns in business methods.

I have no interest in the Scott Engineering Co. other than as a satisfied owner.

If your correspondent "R. R. Richardson," in the same issue, objects to the Scott merely because it is water-cooled, and has a rather higher petrol consumption for its horse-power, they are but poor objections.

The advantages of a water-cooled machine that is a real engineering job, plus the disadvantage of a higher petrol consumption, more than compensate for any advantages of a hot running, noisy, single-cylinder two-stroke.

However, it would certainly be interesting to hear the evidence for and against a long stroke, two-cycle engine.

It is strange that the majority of two-strokes have a stroke-bore ratio of approximately 1:1—in the case of the Scott, the bore is actually greater than the stroke. It is evident there must be sound reasons for makers adopting such a stroke-bore ratio for their two-stroke engines.

C. F. EDMUNDS.

ELECTRIC LIGHTING BY DRY BATTERY.

Sir,—I have read the article by "F.B.S." in your issue of January 16th, also "Practical Engineer's" protest, in your issue of February 13th. "F.B.S." is presumably a non-technical rider as "Practical Engineer" suggests, but his article is interesting, and, generally speaking, represents what a good dry battery will accomplish.

"Practical Engineer" is himself right off the track when he attempts to take up the position of an expert on dry batteries, and although his remarks might have been more or less correct twenty years ago, they are far from correct to-day; if he would like to make the acquaintance of a dry battery which will last for two years, and has in many instances lasted for five years or more on bell and telephone circuits, I shall be pleased to introduce him.

Dry batteries are eminently suitable for motor cycle lighting, and when a suitable combination of battery, lamps, and electric bulb is employed, most satisfactory and economical results are obtained. Cleanliness, readiness, reliability, a reasonable riding light, and no tinkering or cleaning, appeal to many riders who are not out to blind or dazzle all other users of the road. "Practical Engineer" has been unfortunate in the selection of the make of dry cells with which he has obtained his experience, and seems to be mixing up batteries suitable for Faradisation with those suitable for electric head lamps.

I agree that "F.B.S." has probably overstated the case in regard to both candle power and current consumption, as under such conditions of discharge, viz., $1\frac{1}{2}$ ampere, no dry battery of a size suitable for carrying on a motor cycle would give economical results; it is probable that "F.B.S." has mistaken the markings on the bulb and miscalculated the consumption accordingly.

Dynamo lighting is, of course, the ideal outfit, but until that is perfected and brought within the reach of the average rider, electric lighting by dry batteries or accumulators, according to the conditions and requirements as to light, will still hold the first place. I could give "Practical Engineer" examples where dry batteries in their tens of thousands have been used for quite heavy discharges for war purposes both afloat and ashore, which might, perhaps, surprise him. Although interested in the dry battery of another make than that referred to in the letter from "F.B.S.," I feel obliged to vindicate the general use of dry batteries for motor cycle lighting. A. H. HUNT.

REAR LIGHTS ON CYCLES

Sir,—Perhaps the most damaging evidence against the retention in any form of the temporary war-time regulations regarding rear lights on cycles, etc., is to be found in *The Motor Cycle* for March 6th, wherein, on page 219, the following serious admission is made: "When one is expecting rear lights on every vehicle, the absence of them on a road should mean that the road is clear of wheeled traffic—the presence of an unlighted cycle is then more disconcerting than if no rear light regulation were in existence."

This is precisely what the opponents of the rear light have been urging in support of their contention, and it makes it essential that no stone should be left unturned to secure a *status quo ante bellum* with the least possible delay.

The assumption that because there is no light the road is clear for the motorist is against all reason and common-sense, besides endangering the lives of other road users and at once placing a premium upon reckless driving, and in this connection the pedestrian is likely to come off worse than all. Since it is given to none of us to see from the backs of our heads, and therefore impossible to guarantee that a lamp once lit will not go out without calling attention to the fact, it follows that the motorist who drives on the assumption referred to does so with the full responsibility for any "accident" which may occur as a consequence, regulation or no regulation. Further, in the knowledge that "dead men tell no tales," we may fairly surmise that the rear light will certainly not be alight *after* such "accident," and, in any event, it would be impossible for the cyclist to prove that it *was*, as he probably would not have seen it since starting out on his journey.

It is significant that, although motor cyclists are similarly affected as regards this rear light nuisance they have done nothing towards helping forward its removal, and will have to thank the cycling bodies for any benefit which they may indirectly share through their campaign in this direction.

Surely there is a Gilbertian touch about the fact that, on the same page as you advocate the retention of the regulation compelling cyclists to carry rear lamps you are agitating for the removal of another "wartime" imposition—the tax on petrol!

CECIL W. COOKE.

[We cannot agree with our correspondent that because a law is often broken it should necessarily be repealed: Moreover, we did not suggest, and we think Mr. Cooke know it, that motorists should drive rashly when the absence of lights suggested a clear road. Also, it is a fact that an unlighted cycle is, for some reason, harder to see than a pedestrian, and less able to avoid passing traffic. We commend Mr. Cooke's attention to the letter written by Mr. W. J. Sheppard, and published on page 261, March 13th. The insinuation in the third paragraph may be ignored.—Ed.]

WHAT SHALL WE WEAR?

Sir,—I am afraid Phyllis Vernon has not done much winter riding, or she would have had the uncomfortable experience of rain trickling down her neck, also chilled fingers. I think all motor cyclists will agree with me that no coat or gloves will keep rain or cold out when one has to do six or ten hours' riding.

I have now done three years' motor cycling, on an average seventy miles per day, all weathers, country riding; and my ideal dress consists of breeches, woollen coat, leather coat, good rainproof coat, and hat such as A.S.C. girls wear, which I prefer for comfort, having tried all others; also strong boots and leggings.

Previous to 1916 I could not turn a nut. Since riding I have done all my own running repairs; also I am an ardent reader of *The Motor Cycle*. (Mrs.) K.S. Chiswick.

LOSING ONE'S PROP.

Sir,—I notice that "Torque," in your issue of February 27th, asks me to name "any engine of any service type" which a pilot can *not* restart by diving after losing his prop.

As has been pointed out by a gentleman writing in your issue of February 20th with reference to "Torque's" article, under ordinary conditions it ought to be impossible to lose one's prop. with a stationary engine, as the throttle of a stationary engine ought to be slightly open when the control lever is in the extreme closed position. This naturally means that the engine can only be shut off completely by using the magneto switch. Every case of losing the prop. with a stationary engine that comes within the present writer's experience has been caused by excessive wear on the metal block that prevents the control lever from completely closing the throttle, or else binding of the throttle control wires. "Torque's" way of speaking would lead one to think that cases of losing the prop. on stationary and rotary engines are quite on a par. The very reverse is the case.

If "Torque" is thinking of some unconventional engine fitted with half-compression device or its equivalent, he may be right in saying that a dive would restart the engine. The same applies to engines fitted with electric or compressed air starters. Otherwise, I cannot see that the "friction of the air on the propeller" could overcome the high compression usual in aero engines.

I hardly think it necessary to give a long list of the stationary engines I do not consider to be equal to a restart by diving, but I will do as "Torque" asks and give him an example—the 345 h.p. Rolls-Royce. REVS.

BOOKS FOR MOTOR CYCLISTS

MOTOR CYCLES AND HOW TO MANAGE THEM.

The recognised standard text book of the motor cycle: deals with all types of machines and with every part of the machine. 400 illustrations.

Price 2/6 net. By post, 2/10.

HINTS AND TIPS FOR MOTOR CYCLISTS.

A valuable collection of useful "wrinkles" and items of information concerning the running, management, and repair of motor cycles.

Price 2/- net. By post, 2/3.

TRACING TROUBLES.

Motor Cycle Faults, Their Identification, and Their Remedies Fully Explained.

Price 2/- net. By post, 2/2.

Obtainable by post (remittance with order) from

ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4
or of leading Booksellers and Railway Bookstalls.

THE EXCELSIOR LIGHTWEIGHT.

The First of the 1919 Models of Bayliss, Thomas and Co.

ONE by one the well-known makers are re-entering the motor cycle field with new or revised models to satisfy immediate demands. The first of the 1919 British Excelsiors to materialise is a Villiers-engined lightweight, which we illustrate here. This is the first time an Excelsior has been marketed with a Villiers engine. As on the majority of this year's lightweights, the tyres are 26in. x 2½in. Three models are to be offered, a single-gear machine at £50, a two-speed at £56, and one with two-speed gear and clutch at £60.

The 1919 2½ h.p. Excelsior. The Villiers two-stroke engine is fitted.

THE TOOL KIT.

Three Useful Sets for Buyers of Second-hand Machines.

FEW items in the motor cyclist's equipment are more important than the tool kit. It is essential that the owner of a motor cycle should have enough tools of the right quality to enable him to make any adjustments which may be found necessary from time to time.

In the past, the motor cycle makers have got into disrepute owing to the inadequate tool kit they supplied with their machines, but, at the present time, there is a decided tendency among manufacturers seriously to consider this question, and very few, if any, additions will be required to complete the tool kits on future machines.

The question of tools usually concerns the buyer of a second-hand machine to a greater degree than the purchaser of a new mount, and as hundreds of machines are changing hands just now, and quite

a large number of them have been bought and sold many times, it is probably true that fully 50% of present-day motor

Toolkit by Jenks, Wolverhampton.

cyclists will require to purchase new tools, because it is not uncommon for a rider to retain the best of his kit on selling his machine.

For these reasons, the three tool kits illustrated here will be of interest.

One of these has been introduced by Messrs. Maude's Motor Mart, 100, Great Portland Street, London, W.1. The tools are of first-class quality. The C spanner is by Abingdon-Ecco, Ltd., the cycle spanner is a genuine B.S.A., and the adjustable wrench a Lucas. The pliers, screwdriver, file, and the other two spanners, also appear to be of first-class quality.

In addition to the tools already mentioned, it is the intention of Maude's

Motor Mart to supply a special set of box spanners with a screwdriver tommy-bar to fit ⅜in., ½in., ⅝in., ¾in., and 1in. nuts.

Another useful tool kit, which is enclosed in double strength canvas leather-bound roll, provided with a useful strap, is by Messrs. Jenks Bros., Ltd., Wolverhampton. The kit includes two tyre levers, an excellent pair of combination pliers, a screwdriver, three box spanners, a punch, and an ordinary large adjustable spanner, while in the pocket provided there is an oilcan, etc. The price is 18s. 6d.

A third set of tools is introduced by Messrs. Tuck and Blakemore, Coventry, and includes two adjustable spanners, pliers, reversible screwdriver, box spanners, file, punch, tyre levers, oilcan, and belt punch. The roll is strongly constructed of canvas with leather band and loops for the tools and a separate outside strap. The price is 25s.

Tool roll offered by Maude's Motor Mart.

The Tuck and Blakemore kit.

FACILITATING EXPORTS.

General, Department of Overseas Trade (Development and Intelligence), 73, Basinghall Street, E.C.2. The annual fee for admission to the Special Register is £2 2s., which includes the supply of *The Board of Trade Journal*.

The Department will, on request, undertake to ascertain from the War Trade Department, and reply by telegram or telephone at the earliest possible moment, whether licences will or will not be granted for orders requiring immediate acceptance. Urgent enquiries should be by telegram rather than by telephone, and

should be addressed to "Orders, c/o Advantage, Stock, London." They should give the quantity, value, and description of the goods comprised in the order and the name and address of the ultimate consignee if the goods are destined for a neutral country. In the case of orders from Allied or British territory, or from territory in the occupation of troops of the Associated Governments, the consignee need not be stated; the country of destination will, of course, need to be given. A reply of twenty-four words (1s. 6d.) must be prepaid.

IN order further to assist exporters to recover their overseas trade, the Department of Overseas Trade, in concert with the War Trade Department, has made arrangements for bringing to the notice of exporters through the medium of the press, trade journals, etc., and by special notes direct to firms on the "Special Register" of the Department, information regarding changes affecting control over exports.

Firms not already on the Special Register may apply for admission to the Special Register to the Comptroller-

Borrowing an Idea from Henry Ford.

A Suggested Cycle Car to be Built on the Lines of the Fordson Tractor.

MOST of us have heard of the Ford tractor for agricultural purposes, and some of us are, more or less, acquainted with its method of construction, which is reminiscent of the old 8 h.p. single-cylinder Rover car. It will be recalled that the Rover chassis was something on the lines of the Ford tractor (which, by the way, is known as the Fordson), inasmuch as the usual frame supporting the engine, gear box, body, etc., was entirely dispensed with, and the rear and front axles were connected by a single tubular construction of cast aluminium.

The Fordson tractor consists, briefly, of two units: (a) the front axle with its engine, clutch, and accessories; and (b) the rear axle, change-speed gear, and differential; the two connected by flanging and bolting the casings together. This construction allows engine, crankshaft, clutch, gearshafts, and transmission to run in an oil bath.

Practically every designer of a motor car chassis is asked to facilitate the methods of lubrication and to simplify the parts. Why not a cycle car on the lines of the sketches reproduced below?

A Single Tube Chassis.

It will be seen that the rear axle and differential of the suggested design form the rear unit, the detail parts to

be simplified as much as possible, in order to reduce cost of production, while still retaining the quality of lightness. The engine with its accessories, clutch and gear box, might form the front unit, or the gear box alternately could be part of the rear unit.

Obviating Universal Joints.

Universal joints might be required between the engine and gear box and gear box and rear transmission, but it should be possible to reduce the number of these joints owing to the unit construction.

The advantages of the design are that all moving parts run in oil from front to rear, and one filler conveniently placed would suffice. In other words, the rear axle, gear box, universal joints, clutch, and engine would all receive copious supplies of oil.

Practically the only parts that would require separate lubrication would be the outside axle bearings, front wheel bearings, steering pivots, and the shackle joints of the front spring, and joints of the front radius rods. The steering gear could be designed to pass through a side extension of the crank case, and to be lubricated by the same trough-splash system, leaving the steering rod joints to be separately lubricated by large sized screw-down greasers.

The Fordson tractor, which is much used for ploughing in this country. The design suggested possibilities to our contributor for a cycle car on similar lines.

As regards the front axle and springing, the spring is of the transverse type, shackled at the ends, and radius rods would be fitted to maintain alignment. The objection to the design is that at high speeds it would have a tendency to cause rolling and oscillation of the body, but with a vehicle of the cycle-car type, speeds of thirty miles an hour should not be exceeded. In fact, the writer would design and make the engine to cut out at speeds over 30 m.p.h. by governing it; it would then be difficult to detect rolling. This type of springing, properly designed and carried out, is quite luxurious on rough roads.

The Comfort of the Passengers.

The front spring clip swivels on a central pin forming part of the crank case, and this is the only support for the engine in front. It is also possible to raise either of the front wheels separately from the ground without disturbing the equilibrium of the chassis.

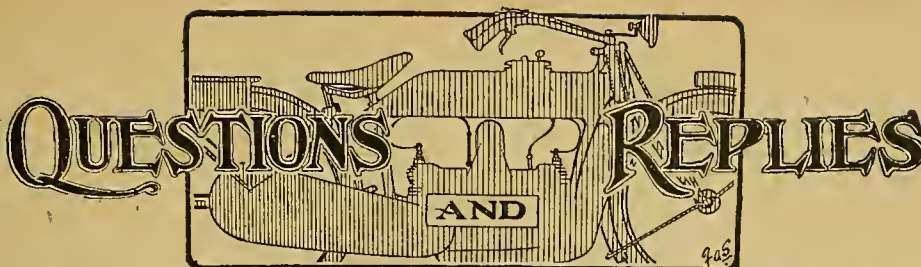

Mr. Parnacott's little cycle car, which was driven by a 5 h.p. F.N. four-cylinder engine, was something on these lines, a wooden box taking the place of the steel tube; but in this case the whole of the weight was sprung, whereas in the suggested Fordson cycle car, at the rear the body would be sprung independently—a principle employed in the Premier cycle car of 1912.

In one respect this suggested design is quite opposed to what is considered ideal car practice. The tendency is for designers to reduce unsprung weight to a minimum, but in this design, probably half of the weight of the chassis would be unsprung, with the natural result that the parts would be subjected to excessive vibration.

MECHANICUS.

Plan and elevation of the suggested cycle car. The engine shown is a four-cylinder, but practically any type of engine could be used. The gear box is in the centre, but it could be combined with the front or rear unit.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Chain Bolt Working Loose.

? Is it impossible to have a chain bolt with a hole drilled in it for a split pin instead of the usual nut, which, in my case, has been the cause of many accidents, owing to its working off? To me it seems very strange how our chain makers can be satisfied with such a fastening, when the remedy is so simple. I should be very glad to know where I could have bolts with holes drilled to fit a $\frac{1}{2}$ in. \times $\frac{3}{16}$ in. chain.—D.M.D.

Yes, there are plenty of chain bolts drilled with a hole for a split pin. Any motor or cycle agent with a decent stock of drills should be able to drill a hole for you, unless, of course, the bolt is too hard. An alternative is, after you have fitted the nut and screwed it up tightly, to take two hammers—one heavy and the other a light riveting hammer—place the flat side of the larger hammer against the head of the bolt, and with the round end of the light riveting hammer burr over the portion of the bolt projecting beyond the nut, and the bolt will then be quite secure.

Electrical Conversion.

? I should like to fit an electric lighting set to a small cycle car if it could be done. I should like to use an old Bosch magneto as generator. This magneto is a D.A.V. type, and off a 45° twin-cylinder motor cycle engine. It has just been remagnetised, and is in first-class condition. I shall be glad to have your advice on what alterations and additions will be necessary to make up this set. I am a first-class mechanic, and have lathe and tools at hand.—W.G.F.

You can use the old Bosch magneto as a generator in the way you suggest, and with your facilities for working you will no doubt be able to make a satisfactory job of it. The simplest way is to take off the contact breaker arm, and use the primary winding arm on the armature as an alternator. This will give a small output, probably about six or eight watts. The best way is to rewind the armature. You will thus get considerably more output on account of the winding, which will then occupy all the space formerly filled by the low and high-tension windings. Use wire 23 S.W.G., either double silk covered or enamelled, and get as much on as you can. If you want a continuous current, you will have to fit a commutator; but as it is only a two-part one, it will not cause you much

trouble. While it is not possible to state the exact output from these small generators, you might reasonably expect to get about 2.5 amperes at six volts running at about 2,500 r.p.m., from which quite a useful light can be obtained. If you take out the armature for rewinding, place an iron "keeper" across the magnet poles before doing so, and do not remove it until the armature is returned.

Miniature Plugs.

? (1.) Can you inform me of an insulating material which could be turned or moulded for use in miniature sparking plugs for model work? (2.) Can you give me full particulars of the Beghee igniter?—R.H.C.

(1.) For this purpose we should recommend you to try ebonite or vulcanite. It can be turned in a lathe with care, taking light cuts, and has a very good appearance when well finished. After turning

IMPORTANT NOTICE.

GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication.

ILIFFE & SONS LTD.

has been finished, leaving as good surface as possible, apply two or three different grades of emery paper, taking care not to burn the surface of the work. Then apply a paste of oil and rottenstone on a rag and polish until a jet-black bright surface is obtained, finishing off with a piece of felt or similar material. Penholders are sometimes made of this substance, and you might find this a convenient means of obtaining the material. A short length cut out of a penholder would probably do very well for what you require with a little work done on it in the lathe. (2.) The principle appears to be identical with that used in the Dixie and other magnetos of the inductor type. The movable soft iron core would no doubt be fitted with end pieces at right angles to each other, giving a Z shaped formation. The motion being oscillating would not be so suitable for a high speed engine as a rotating motion used in the above magnetos.

Clutch on Two-speed Model.

? I have recently bought a $3\frac{1}{2}$ h.p. Premier with two-speed counter-shaft gear. All the controls are missing, and I am in doubt regarding the clutch. Where is it situated on this machine?—L.W.
The clutch is within the gear box.

Charging Resistance.

? I should be obliged if you could tell me the candle-power and number of carbon lamps I should require on switchboard to charge a two-volt accumulator off a 220-volt main.—J.H.M.

You do not state the ampere hour capacity of your accumulator on which the charging rate depends. Assuming that the capacity is twenty ampere hours, then two carbon lamps each of 32 c.p., wired in parallel, will give a suitable charging rate. If it has a capacity of forty ampere hours, then double the number of lamps. The light of the lamps will be practically unaffected when in series with an accumulator of only two volts, so that it is quite possible to use some of the lamps of a house supply, thus saving considerable expense in current. The ampere hour capacity of the accumulator will be marked on the label attached to it by the makers.

Fitting a Philipson Pulley.

? I have a 1915 $3\frac{1}{2}$ h.p. Rover combination with Sturmey-Archer three-speed hub gear. It runs well, but I am troubled with knocking on picking up round sharp corners, and also lack speed on the level with present gear, about 5 to 5 $\frac{1}{2}$, which, however, I find is about suitable for main road hills. I am proposing to fit a Philipson pulley, and should be glad of the following information. (1.) Which is the more suitable, automatic or hand-controlled? (2.) Please explain the necessary working of both to reduce the gear in the case of rounding sharp corners. (3.) Do you consider results will justify expenditure?—E.H.L.

(1.) A hand-controlled pulley would be more suitable. (2.) To reduce the gear, the brake is applied on the exterior of the pulley; if no brake is fitted, the boot is applied. (3.) The addition of a pulley would undoubtedly be a refinement to your machine. The knocking and lack of speed are probably due to engine trouble. Perhaps the compression is too high, or the cylinder requires to be cleaned of carbon deposit, and the engine generally adjusted.

Misfiring.

?

I have a 10 h.p. four-cylinder Henderson. A few weeks ago I took the engine down. Since then there has been persistent misfiring in the back cylinder. I fitted new rings to the pistons, and new points to the magneto. The rings and magneto are quite in good order. Yet as soon as I accelerate or get on a hill the rear cylinder misses badly. Can you give me any hint as to the probable cause? I have tried all I know, and am no nearer the solution than I was when it first occurred.—A.H.C.

From what you say in your letter, it seems clear that the trouble is not electrical. We should therefore recommend you to look at the inlet valve, and also see that the induction pipe union of this cylinder is air-tight. Also verify the tappet clearances.

Liability for Fire.

?

I took my Scott motor cycle for repair to a motor engineer, who found that a new crank was required. This part he was not able to obtain, and so he kept the Scott until one could be got. The building in which my machine was stored was destroyed by fire. Is the engineer legally obliged to pay me compensation? The insurance policy which I previously held for the machine had been allowed to lapse before the fire occurred. Also, what do you consider a fair value for the Scott with its accessories? It was bought new by me in July, 1915, and was in excellent condition.—W.H.

The motor engineer is not liable for your machine being destroyed by fire while on his premises, unless the fire occurred through his negligence or the negligence of anyone in his employ. The value of the machine would be about £40.

Timing a Four-cylinder.

?

Would you please tell me the correct positions for timing both the ignition and the exhaust valves of a 5-6 h.p. F.N. four-cylinder machine, 1912?—S.S.

The machine should be timed in the following manner: Turn the crankshaft until the piston of the back cylinder is five to six millimetres from the top of the compression stroke. Unless the slide holder on the crankshaft has been altered, the carbon brush of this will point to the position of the bottom right-hand terminal of distributor, assuming the latter is in position. Now grasp the contact breaker of the magneto, and turn it until the maximum resistance is felt, and slide the magneto gear wheels into engagement with the corresponding wheel on the crankshaft of the engine. Having bolted up the magneto and fitted on the distributor, verify the timing. The points of the contact breaker should commence to separate when the back cylinder piston is in the aforementioned position. The wiring of the distributor in relation to the respective cylinders is: bottom right wire to back cylinder; top right wire to third cylinder from back (or second from front); bottom left wire to second cylinder from back; top left wire to front cylinder. The lengths of

the wires will, in themselves, show which cylinders they go to. Beginning with the back cylinder, the exhaust valve should be timed in the following manner: Set the exhaust valve to close just after the completion of the exhaust stroke. It will then commence to open when the piston is about one-seventh of the length of the stroke from the bottom of the firing stroke.

Using a Rectifier.

?

Is there a satisfactory method of charging accumulators 4 volts 40 amps. from 200 volts alternating current lighting circuit? The electric sundries people list a rectifier, but it charges at a lower rate than the directions on the accumulator state. Would this answer?—T.H.

You can charge your accumulator from the alternating mains through a rectifier, although the latter may give a lower charging rate than that specified by the makers of the accumulator; it will merely take a longer time to charge. The effect of the longer time on the accumulator will be beneficial rather than injurious. If you do not wish to buy a ready-made rectifier, it is possible to construct one on the principle of the Noden valve. Details are given in the new edition of "Electricity and the Motor Car" now in the press, but it consists mainly of an aluminium and a lead plate immersed in a solution of ammonium phosphate. This acts as a rectifier only, and must be used in conjunction with either a transformer or a suitable lamp in series with it to reduce the voltage. In your case four 32 c.p. carbon filament lamps of 180 volts would be suitable, wired in parallel with each other, but in series with the rectifier and accumulator.

Attention to a Clutch.

?

Will you kindly advise me on the following: (1.) My machine, a Rudge Multi and sidecar (1913), runs excellently solo *when clutch is not used*. With sidecar clutch goes in with a "bark," and engine stops, no matter how gently the clutch handle is released and how much the petrol lever opened. Have tried loosening the cone at end of gear and clutch projection, but with no improvement. Rudge booklet does not tell how this may be remedied. (2.) To remove clutch and gear apparatus (for overhauling if necessary) is anything further required than to undo the four exterior nuts?—J. F. GALLAHER.

The trouble evidently lies in the clutch plates. As you suggest, by undoing the nuts on front of the multi-gear you can remove the front part of it straight off the axle. This should be immersed in paraffin. There is no need to remove the Bowden control, and this can be utilised to open and close the plates while in the paraffin. Afterwards shake the paraffin out and put in some engine oil while the clutch is off the axle. Poke a wire through the lubrication holes and see that they are clear. You should note that any initial pressure interferes with the proper working of the clutch.

READER'S REPLY.**Timing.**

With reference to your explanation of "F.W.R.'s" difficulty in timing his engine, in your issue of March 6th, may I suggest that another explanation is possible? I have experienced the very same trouble as "F.W.R.," and found it due to interchanging the valve tappets by mistake, thus causing complete loss of compression.—S. R. POOLE.

EXPERIENCES WANTED:

"J.R." (Walthamstow).—Binks carburettor fitted to a Triumph, as regards slow running and acceleration.

RECOMMENDED ROUTES.**SWINDON TO WITNEY.—S.G.P.**

Swindon, Highworth, Faringdon, Black Bourton, Witney. Approximately 35 miles.

WATTON TO STRADBROKE.—F.H.

Watton, Brockles, Larling, East Harling, North Lopham, South Lopham, Diss, Scole, Stradbroke. Approximately 30 miles.

CREWE TO SURBITON.—T.P.

Crewe, Newcastle, Weston, Rugeley, Lichfield, Colehill, Coventry, Southam, Fenny Compton, Banbury, Aynho, Bicester, Aylesbury, Amersham, Uxbridge, Staines, Kingston, Surbiton.

BRIGHTON TO KNOWLE AND DORRIDGE.—E.S.H.

Brighton, Henfield, Cowfold, Horsham, Cranleigh, Guildford, Worplesdon, Bisley, Bagshot, Bracknell, Reading, Pangbourne, Stratley, Wallingford, Dorchester, Oxford, Banbury, Warrington, Warwick, Wroxall, Knowle.

BRISTOL TO ILFRACOMBE.—S.G.P.

Bristol, Redhill, Highbridge, Bridgewater, Williton, Dunster, Porlock (both Porlock Hill and the avoiding route, on which you have to pay 1s. toll, are in very bad condition, we understand), Countisbury, Lynton, Parracombe, Combe Martin, Ilfracombe. An alternative route is: Bridgewater, Taunton, Milverton, Bampton, South Molton, Barnstaple, Ilfracombe. Approximately 90 miles by the first route, and 110 by the second.

MARGATE (VIA LONDON) TO MANCHESTER.—O. AND A.

Margate, Sarre, Canterbury, Charing, Lenham, Maidstone, Ightham, Wrotham, Farningham, Sidcup, Lewisham, Old Kent Road, New Kent Road, Elephant and Castle, St. George's Road, Westminster Bridge Road, over Westminster Bridge, Whitehall, Cockspur Street, Pall Mall, Regent Street, Oxford Circus, Portland Place, turn left, then right at Baker Street, and straight on *via* Park Road into Finchley Road, then through Golder's Green to Finchley and Barnet, St. Albans, Dunstable, Hockliffe, Newport Pagnell, Northampton, Husbands Bosworth, Leicester, Loughborough, Derby, Ashbourne, Leek, Congleton, Wilmslow, Manchester. Approximately 250 miles.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **& Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged; when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to **Iliffe & Sons Limited**.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

6 h.p. Enfield, coach sidecar, wind screen, speedometer; 65 gns.; reliable.—2, King Edward Gardens, Barnsley. [5965]

ENFIELD 3 h.p. Twin, 2 speeds, £25; also Canoelet sidecar, suit 3½ h.p. or 6 h.p., £10.—93, Northwood Rd., Clifton. [5976]

ENFIELD 2½ h.p., 2-speed, good condition; can be seen and tried by appointment; £32.—Perrins, Architect, Redditch. [X5993]

RIDER TROWARD and Co., 31, High St., Hampstead.—Orders now being booked for earliest deliveries Enfields, all models. [2261]

ENFIELD 2½ h.p. twin, 2-speed, grey model, very little used, new tyres; £30.—Wilson, 16, Aberdeen Terrace, Northampton. [X6071]

1916 Enfield Combination, mileage 1,500, Lucas accessories, original tyres; 90 gns.—17, Tamworth Park, Commonsides East, Mitcham. [6059]

ENFIELD 6 h.p. Combination, J.A.P. engine, very good order, ready to use; £65.—Roberts, Music Stores, King St., Melton Mowbray. [X6085]

ENFIELD 3 h.p. Twin, Model 140, 2 speeds, etc., slightly soiled; 50 gns.—The Exeter Motor Cycle and Light Car Co., Ltd. Bath Rd., Exeter. [0958]

ENFIELD 6 h.p. Combination, perfect running order, splendid condition, lamps, speedometer; 69 gns.—Pratt, Decorator, Tottenham Lane, Hornsey. [6037]

JONES' Garage—We are accepting orders for all models of Enfields; one delivery promised this month; deposits optional.—Broadway, Manswell Hill. [0993]

ENFIELD 6 h.p. Combination, coach sidecar; £70; exchanges—George Smith, Motor Cycle Depot, Clapham Junction. (Opposite Arding and Hobbs.) [5828]

LATE 1915 6 h.p. Enfield Combination, with Lucas dynamo lighting, electric horn and inspection light, good condition; £98, no offers.—Thomas, Midland Bank, Netherth. [X5917]

ENFIELD Combination, 6 h.p., late 1916, Lucas dynamo lighting set, speedometer, horn, hood and screen, in perfect order; £125.—Boddy, Hernshead and Esber Av., Walton-on-Thames. [5877]

NEW Enfield Combination, 8 h.p., purchased December 1918, only driven from works, spotless, fitted speedometer, Klaxon horn, adjustable wind screen, hood lamps; £155.—Simpson, 6, Wilbury Crescent, Hove. [X5874]

ENFIELD 2½ h.p., 2-stroke, purchased August, 1917 brand new, in first-class condition, a really genuine offer of a most efficient machine; price £40, lowest; no dealers.—C.V.T., 28, Cavendish Sq., London, W.1. [X5864]

COMBINATIONS.

1910 **A.J.S. Combination**, 6 h.p., 3-s.p., clutch, kick-start, very good order £110

1916 **Powerplus INDIAN**, 7-9 h.p., 3-s.p., hand and foot clutch, Swan Sidecar, dynamo lighting; very good order £135

1917 3½ h.p. **twin BROUGH Combination**, very smart and sporting; a beauty £90

1917 6 h.p. **ENFIELD Combination**, hood, screen, lamp, splendid condition £100

SOLO MACHINES.

1917 **T.T. ROVER**, Phillips' tail lights, lamp, speedometer; 300 miles .. £47

1915 2½ h.p. **DOUGLAS**, all accessories Special Racing J.A.P., 8-10 h.p. twin J.A.P., overhead valves; fastest machine on the road; lamps, all accessories £65

1917 2½ h.p. **A.J.S.**, splendid order .. £55

CARS.

1914 10 h.p. **STELLITE**, dickey seat, hood, and screen, all accessories .. £254

1914 **SINGER**, dynamo lighting, hood, screen; everything perfect £254

1915 (late) 15 h.p. **twin STUDEBAKER**, 4-seater, touring, self-starter, dynamo lighting; all working guaranteed perfect £220

MOTOR CYCLES FOR SALE.

Enfield.

ENFIELD 3 h.p. Twin, 1917, 2 speeds, tyres good, one new, horn, speedometer, 4,000 miles, in thorough good order, recently overhauled; may be seen Birmingham or Coventry; £50.—Box 3,077, c/o The Motor Cycle. [X6065]

SEIL 6 h.p. 1915 Royal Enfield Combination, fitted with Lucas dynamo lighting set, speedometer, horn, everything perfect condition, will climb any hill; give any trial; 90 gns.—Widdop, Rose Mount, Ripponden, near Halifax. [X5917]

ROYAL Enfield Combination, 1917, mileage well under 1,000, condition and appearance as new, lamp, horn, and tools; 100 gns.; recent countershaft geared single part.—Hawes, 129, Wantage Rd., Reading. [6018]

ENFIELD Combination, overhauled by the maker, 1916 fittings, excellent condition, absolutely a sound outfit, ready for a couple of seasons' use without spending anything on it; price 64 gns.—Longman Bros., 2, King's Parade, Unbridge Rd., Acton. Tel.: 1578 Chiswick. [6067]

Excelsior.

EXCELSIOR Auto-cycle, 10 h.p., Victory model, nearly new, all latest improvements; £65, a bargain.—Particulars, Hall Keeper, Town Hall, Hendon, Middlesex. [X5974]

1916 7-9 h.p. American Excelsior, electrically equipped, wants slight attention and battery, underslung coachbuilt sidecar; £69/10.—Halifax Motor Exchange, 18a, Union St. South, Halifax. [5888]

AMERICAN Excelsior, 1916, 7-9 h.p., kick start, electric light and horn, hand-foot clutch, 3-speed gear, with Gloria sidecar, tyres good, splendid mechanical condition; officer must sell owing to demobilisation; £85.—Box L9,900, c/o The Motor Cycle. [5825]

Fafnir.

3½ h.p. Fafnir, Bosch, B. and B., 2 speeds, and clutch, 32 spring forks, low, running order; £20.—19, Wood Lane, Shepherd's Bush, W.12. [6127]

F.N.

5-6 h.p. F.N., 2-speed, clutch, all in good condition; £28/10.—455, York Rd., Wandsworth. [5971]

F.N., 2½ h.p., Bosch mag., new belt, just overhauled, in perfect running order; first £15 secures.—Douglas, 66, Queen's Rd., Brighton. [5738]

2 h.p. F.N., shaft drive, 2-speed and clutch, new front 24 tyre (Dunlop), fast, and powerful; 19 gns.—19, Wilcox Rd., South Lambeth, S.W.8. [6166]

F.N., 3 h.p., T.T. (74×80), single, belt drive, rebuilt throughout, Bosch, Sanspar; £20, no offers; seen by appointment, North London.—Write, Shaw, Trierford, Uxbridge Rd., Slough. [X5788]

Harley-Davidson.

1916 Harley, best Harley sidecar, dynamo model, offers, or exchange.—29, St. Leonard's St., Bromley-by-Bow. [6157]

RIDER TROWARD and Co., 31, High St., Hampstead.—Orders now being booked for earliest deliveries new Harley-Davidsons. [2262]

HARLEY-DAVIDSON, 1919 models, actually in stock; also 1916 7-9 h.p. electric model and sidecar, in exceptional condition.—Lamb's, 151, High St., and 50, High Rd., Wood Green, N. [5890]

Henderson.

HENDERSON Combination, splendid condition, speedometer, lamps, etc.; £65.—29, Brigstock Rd., Thornton Heath. [6048]

RIDER TROWARD and Co., 31, High St., Hampstead.—Orders now being booked for earliest deliveries new Hendersons. [2264]

Hobart.

1917 Hobart, 2½ h.p., 2-stroke, in new condition; 28 gns.—16, Spencer St., Hinkley. [X6124]

HOBART-VILLIERS, 2½ h.p., 2-stroke, 2-speed, Amac, C.A.V. mag.; £27/10; ride away.—Avondale, Southampton St., Farnborough, Hants. [X5876]

Humber.

HUMBER, brand new 1917 3½ h.p. flat twin model in stock.—Moss, Wem. [X5921]

3½ h.p. Humber, 3-speed, free engine, and sidecar; £45.—Pickering, Mardol, Shrewsbury. [6108]

1913 3-speed Twin Humber, good condition, with cash, for Douglas, or sell £20.—27, Ann St., Plumstead, S.E. [X5933]

HUMBER 2½ h.p., 1914, in good condition, requires tuning up; £16, or nearest.—Wilson, Dover Cottage, Royston, Herts. [5883]

HUMBER, 1914, 3½ h.p., 3-speed, clutch, kick-start; £35, or exchange lightweight.—28, Suonybank, Oakworth, Keighley. [X5990]

MOTOR Cycle, Humber 2 h.p., lightweight, perfect running order; £15; seen by appointment.—Manning, 27, Milton Rd., Wallington. [5824]

1913 Humber, 3½ h.p., 2-speed, and P.E., in splendid condition, good tyres, new Dunlop belt, 26 gns., first cheque.—Wiles, New-hatch, Kent. [6019]

RIDER TROWARD and Co., 31, High St., Hampstead.—Orders now being booked for earliest deliveries new 3½ h.p. and 6 h.p. flat twin Humber. [2265]

THE "BRITISH DOMINIONS" Motor Cycle Policy Covers all Serious Risks.

Every Motorist recognises the danger signal, which must bring to mind the many and varied risks common to motoring. Motor cyclists especially need a most complete form of insurance covering the many risks to which they are liable.

The "British Dominions" Policy for private motor cycles (with or without sidecar) has been specially devised and covers practically every serious risk to which the motor cyclist is liable.

The policy is thoroughly comprehensive, covers accidental and malicious damage up to full insured value, including lamps, accessories, and tyres when the cycle is also damaged; covers unlimited indemnity in respect of the liability of

THE MOTORIST'S DANGER SIGNAL

the assured to the public for injury to persons or property (including all law costs incurred with the written consent of the Company) and covers damage or loss of cycle, sidecar, and accessories from fire, explosion, self-ignition, burglary, theft, and transit etc.

A bonus is allowed for no claim, and special reductions of premiums are provided for.

The policy may also be extended to cover the assured in respect to fatal and serious personal accidents. Every motor cyclist should avail himself of this beneficial policy.

Send a postcard to-day asking for "Motor Cycle Policy" prospectus which contains full particulars.

Right from the Start.

P. & M. design was right from the start. Its principles of construction are the same to-day as in 1900. Detail refinements are the only additions.

The high value placed upon the P. & M. is due to this consistency of design through eighteen years, and emphasised by the fact that owners consider nine and ten year-old P. & M.'s the equal of new models of other makes.

READ THIS.

"My machine, although a 1910 model, still runs perfectly, and, after two years, storage, started at first effort. The machine has covered many thousands of miles and is still good for many more. In fact, in spite of its age, I consider it quite as up-to-date as many so-called new models of other makes."

Roads and Road Transport.

READERS who studied their daily papers with care on Wednesday last week may have been tempted to imagine that the much advertised opposition of road users to the Ways and Communications Bill had, to use a popular expression, "fizzled out" during the second reading on the previous two days. Any such conclusion, however, would have been distinctly inaccurate, for, though the Parliamentary Road Transport Committee did not press the matter to a division, their chairman, Mr. W. Joynson-Hicks, made it quite clear, not only that motorists were anything but satisfied with the Bill in its present form, but that a storm of opposition to it had been aroused throughout the country among the local authorities whose duty it is to make, repair, and maintain the roads.

The mere fact that a division was not challenged on the second reading must not be taken as an indication that the representatives of automobilism in Parliament will not have a good deal to say when the committee stage of the Bill is taken. As a matter of fact, we know that the clauses affecting roads and road transport will be strenuously contested by the Parliamentary Road Transport Committee, and we have no doubt whatever but that certain amendments will be agreed to which will safeguard the roads and will render it less easy for an autocratic Minister to subordinate them to the railways.

Under the Ways and Communications Bill, as it stands at present, it is proposed that Brigadier-General Maybury, now manager and secretary of the Road Board, of late responsible for the construction and upkeep of the roads in France used by the British armies, and before the war the Kent County road surveyor, shall be placed in charge of a special Roads Department of the new Ministry. That is excellent so far as it goes, but it does not go far enough.

In the first place, it would be within the power of the Minister summarily to dismiss General Maybury, and to substitute for him a far less

competent man; in the second place, General Maybury would be in a subordinate position, where it would not be part of his duty to determine questions of *policy* when the interests of the railways and of the roads happened to clash. Such determination of policy would be the prerogative of the Minister, and in the case of Sir Eric Geddes, the Minister designate, there is reason to fear that the advantage of the railways would be served at the expense of the roads.

We believe it will be strongly argued during the committee stage of the Bill that the Road Board should be revived, either as a separate Department with a Minister at its head, or as a Department under the general supervision of the Ministry of Ways and Communications. From the point of view of all motor vehicle users the former would be the more acceptable alternative, but, judging by the attitude of the House last week, we do not think that roads and road transport are likely to be entirely divorced from the new Ministry. It is more probable that the Road Board will be attached to the Ministry, though even this is problematical.

Government Motor Cycle Sales.

THE amazing idea has been put forward in the evening daily provincial press that the high prices fetched by Government motor cycles indicate that the motor cycle manufacturers are endeavouring to corner the market by buying up everything that may be converted into a serviceable machine. This they designate as a "profiteering ramp in the motor cycle trade," though why profiteers should buy goods at high prices they entirely fail to explain. The high prices are eminently satisfactory from the country's point of view (though not from the buyers'), but they appear to us to be due rather to the eagerness of riders to possess at once some sort of motor cycle than to any action on the part of motor cycle manufacturers, who, in the matter of these sales, stand in a position of absolute equality to the general public.

Silencing the Exhaust.

A Rider's Experiments with Various Forms of Silence.

NOW that we have reason to expect a greater degree of silence in valve gear and transmissions, the problem of eliminating the sound of the exhaust is due for attention on the part of motor cycle manufacturers. While the mechanical noises on most machines were more irritating than the note of the exhaust, there was little to be gained by reducing the latter, because it only made the former more apparent; but in these days of all-round mechanical improvement manufacturers should make an effort to render their machines silent in all ways.

The need for reform is evident to those who do a thousand miles holiday on a sidecar outfit. In some cases there is difficulty in carrying on conversation, and the noise made by the engine is perhaps more apparent when compared with the intensity of silence when the machine is stopped.

Silencers vary according to the tastes of the makers. The latter may or may not possess an exhaustive knowledge of the laws governing the question of silencing. For instance, one finds a bigger expansion chamber

Fig. 1.

on some lightweights than on some 4-5 h.p. machines. Again, some have empty chambers, while others embody baffles of various descriptions. A few makers utilise aluminium alloy for heat conducting purposes; others use sheet steel cylinders with timbrellic propensities. In most cases the primary exhaust pipe has the same diameter as the tail pipe.

The position of these pipes is an important matter. For example, in some makes the entrance and exit of the gases are on the opposite ends of the barrel; in others the pipe enters tangentially on the circular side

Fig. 2.

of the silencer, the gases leaving at some other point of the circumference. The idea is to produce a spiral course for the gases within the silencer. In cases where the primary exhaust pipe enters the barrel adjacent to the opening of the tail pipe, it seems evident that the gases entering the barrel must obstruct the passage of the gases leaving the silencer, and thus create back pressure.

The writer once possessed a machine having this defect, and it may interest readers of *The Motor Cycle*

to follow the evolution of an improved silencer which is now fitted to his machine. The original silencer is illustrated in fig. 1, which also shows in the right-hand sketch the alterations marking the first step in the experiments.

Fig. 2 shows a copper pipe passing directly from cylinder to a copper silencer built up of three expansion spaces. This was a tremendous improvement on

the original so far as efficiency was concerned, but the noise was much the same.

Fig. 3 depicts another idea which was tried in conjunction with the original silencer. The back pressure was fairly low, but the cone produced megaphonic results giving an exhaust of high resonance. The big end was open to the atmosphere, the idea being to impel a current of air through it by the motion of the machine and so add cold air to the hot gases. It was proved, however, that the exhaust gases found an exit from the big end as well as from the fish tail. Investigation showed that with the large end open there was more back pressure than when it was closed by a cap, the difference in speed being about two miles per hour.

Fig. 3.

This silencer had another drawback, *i.e.*, the difficulty of attachment. The intermediate chamber was therefore omitted, likewise the cone, and an internal chamber added in its place. This arrangement, which is shown in fig. 4, was satisfactory from the standpoints of efficiency and reduction of noise,

Fig. 4

although perhaps it may appear massive and un-

One wonders if the principle is capable of application to silencers. The salient feature of silencing is quickly to reduce and consequently the install resistances to the gases to a minimum. The whole subject is an interesting one, as a fact that some engines show higher efficiency with certain silencers than when exhausting directly into the atmosphere.

may appear slightly.

The venturi principle of application to factors in silencing exhaust gases are the temperature, volume, and to the passage of the gases. It is a proved principle that gases show higher velocity when passing through a narrow passage. D. SHARP.

FROM THE MURMAN COAST.

A PELMANIST'S EXPERIENCES.

Wherever the British Army goes, the "Little Grey Books" follow. They are to-day almost an integral part of the outfit of a British officer or soldier.

Even from the bleak Murman Coast, where a British force is gallantly holding back the Bolshevik hordes, come letters full of gratitude for what Pelmanism has done for its students.

Here is one such letter, recently received :

"Your letters so far have been very valuable to me. Thanks to your teaching, the ——— of the North Russia Expeditionary Force selected me to be his typist; later, through my interest in some rather difficult problems—which became comparatively easy when the Exercises, especially Exercise X., were applied to them—he made me his confidential clerk.

"I realise how much I have lost through not enrolling in the Pelman Institute immediately upon my arrival in England in the summer of 1917.

"Your exercises have also been of intellectual benefit to me; through their aid new interests are opening out. What at first appeared to be a very barren outlook in Russia now has every sign of being very profitable, for my knowledge of Russia, its people, its industries, its resources and possibilities, is on the upward plane—I am learning how to see, and, having seen, to understand."

This letter emphasises in a peculiar and striking fashion "the interest-power" aroused by Pelmanism; and "Interest," as everybody knows, is a big item of the secret of success. The man who is interested displays keenness—and keenness to reach a definite goal has never yet failed to result in progress.

Let every non-Pelmanist reflect upon this letter: let him consider what it means. Here is a man taken from civilised life, from his home, his regular occupation, his usual environment, and set down, a soldier, upon one of the most inhospitable and apparently uninteresting parts of the European Continent.

His first sensation is one of hopelessness: his uncongenial surroundings discourage him. Left to himself he would become the victim of circumstances, as so many have done.

He takes up Pelmanism. He has heard much of it and, without attaching much importance to it, decides that he might as well study that, having nothing else to do in his leisure.

Within a few weeks he begins to be conscious of a new stimulus; his outlook brightens, his individuality begins once more to assert itself. He learns the grand truth which so many have now learned—that "circumstances" cannot extinguish the man who refuses to be extinguished.

His activities—inspired by the "Little Grey Books"—revive; his faculties respond to the wholesome and invigorating Pelman exercises—as they always do. Success follows almost immediately: a small success, but it is quickly followed by further success. New interests appear; he begins to find there is more—much more—in his environment than he was conscious of before. To use his own words, "I am learning how to see, and, having seen, to understand."

How many unsuccessful men and women realise that they themselves are largely to blame for "not having seen." There are some who live all their lives confronted daily by possibilities and opportunities which they never see; clerks who might become managers if they saw what was in front of them; salesmen who might become organisers and directors if they would view their human and other surroundings with seeing eyes.

If Pelmanism did no more than compel its students to a wider and deeper vision, it would justify all that has been said in its praise. But it does far more.

Having awakened you to a realisation of opportunity—having shown you that for each and all of us the world is still full of measureless possibilities, it then develops in you a sense of your own potential powers, stimulates you to a resolve to develop and use those powers, gives direction and strength to your efforts, shows you how to train and apply your faculties, and finally leads you to that form of success which is your heart's desire.

There is no magic in it. It is so simple and as understandable as the development of muscular strength and dexterity by regular physical exercise. An athlete can train any particular muscle or group of muscles by means of definite physical exercises; so the Pelmanist trains a faculty—any faculty, or all of his faculties—by practising the simple and interesting mental exercises set in the "Little Grey Books."

The result is never in doubt. There has never yet been a single case in which the Pelman exercises, regularly followed, have failed to produce benefits. It may be that only twenty or thirty minutes a day can be devoted to them; that does not matter. If the exercises are conscientiously followed, you will find the benefit coming from the first—benefit that you yourself can note and appreciate.

The mere fact that well over 400,000 men and women of all vocations have now adopted Pelmanism says a great deal for the system—proves that it is no new experiment, but a thing of tried and proved practical worth. Amongst those 400,000 you will find many who have been placed exactly as you are now placed—who have felt just your fears and hopes—have experienced just your disappointments—and who have finally taken up Pelmanism to find—sometimes in the very first of the "Little Grey Books"—just that information and guidance which has changed their careers from failure to success. Can you afford to neglect Pelmanism?

QUESTIONS OFTEN ASKED.

Readers are requested to note very carefully the Questions and Answers given below. It will save them and the PELMAN Institute a certain amount of correspondence about details.

1—How many lessons are there in the PELMAN Course?

Twelve. The Synopsis of these lessons will be found in the pages of "Mind and Memory."

2—How much time should be given to the Course daily?

This depends on personal circumstances, as some pupils have more spare time than others. Twenty minutes or half an hour daily should enable the pupil to complete in three or four months.

3—Will this Course help me in my business?

There is no brain worker in any business or profession who cannot benefit by the study of the Course.

4—What do you mean by the word "System"?

This word is used in order to express a certain quality in the training; that quality is *Method*: in other words, the organisation of knowledge and its scientific application to everyday needs.

5—Is the result of the training lasting?

Undoubtedly; the training ensures permanent benefit. The man who is put on the right road for physical health must continue to respect physical laws, otherwise his health declines once more. It is the same in the mental world. The PELMAN System shows a man how to use his mind in the best way, but if he becomes careless he naturally loses what he has gained, and his mental efficiency relapses into his previous inefficiency.

6—Is the instruction individual?

Yes. The system is individualised to each pupil by means of annotations; by personal letters; and by answering the personal questions of the pupil himself.

7—I have not had a good education. Is this a drawback?

If you have had an ordinary school education you will find nothing in the PELMAN System which you cannot understand and nothing which may not be a source of profit.

Full particulars of the Pelman Course are given in "Mind and Memory," which also contains a complete descriptive Synopsis of the twelve lessons. A copy of this interesting booklet, together with a full reprint of "Truth's" famous Report on the work of the Pelman Institute, and particulars showing how you can secure the complete Course at a reduced fee, may be obtained gratis and post free by any reader of THE MOTOR CYCLE who applies to The Pelman Institute, 199, Pelman House, Bloomsbury Street, London, W.C.1.

OCCASIONAL
COMMENTSBY
"IXION"

Engine Bearings.

WE all know that the first parts of the average motor cycle engine to develop serious wear are the connecting rod bearings. I hail two tendencies which are distinctly evident in what a haberdasher would call the new season's goods. The first is the system of making the gudgeon pin fast in the small end of the rod and giving it bearings in the piston bosses, which are naturally of larger area than the conventional type. The second is the increased application of roller bearings to the big ends. Patents probably hinder an even wider application of this system. The roller bearings stand up much longer than phosphor bronze, but they can claim another advantage, which the average rider may not yet have realised. *They require far less oil.* Give the motor cycle engine four things which figure on some of the newer 'buses, namely:

1. Gudgeon pin bearings which need less oil.
2. Big end bushes which need less oil.
3. Cylinders which do not distort.
4. Pistons which do not push a bank of oil in front of them, and set up unnecessary frictional heating.

Then we can cut down the rate of lubrication. The periods between decarbonisations will lengthen out and tune will be longer maintained.

Canadian Needs.

A CANADIAN who has served in the R.F.C.-R.A.F. for the past two and a half years, sends me a very frank letter from Ontario upon his demobilisation. Whilst in the Service he rode many miles on a P. and M., and says he grew to like "the dependable little creatures." He has no good word to say for British machines, apart from their sturdiness and reliability; "3½ h.p. is far too small, and I hate single-cylinders like poison." He frames an indictment from the Canadian standpoint, which includes the following counts:

1. Crazy handle-bars.
2. Bowden wire control.
3. Too many levers on handle-bars.
4. Two-lever carburetter.
5. Small wheels and tyres.
6. Hand-operated lubrication.
7. Side-by-side valves.
8. Insufficient springing.
9. Extremely high prices.
10. Front brakes.
11. Enclosed chains.

I don't know what "crazy handle-bars" mean. I prefer Bowden wires to jointed rods. There are usually six levers on the handle-bar—carburetter (two), ignition, brake, valve-lifter, clutch. I agree in so far that I prefer a single-lever carburetter, ignition lever on tank or magneto, no handle-bar brake control, *i.e.*, three h.b. levers instead of six. I do not desire to

use another two-lever carburetter. Tyres and wheels are large enough for pre-war English roads, but 26×2¼ in. is probably too small for overseas work and for post-war British roads. Hand-controlled oiling ought to have been washed out years ago. What's the matter with side-by-side valves? They are a good deal more reliable than the finicky little o.h.v. gadgets beloved of most Yankee designers. Springing—well, the unsprung frame will not be a good seller in 1920; my correspondent must grasp the fact that we used to have good roads in this country, and were too unimaginative to build motor cycles for countries not so blest. Prices? Small outputs with an assured market do not make for price cutting. Front brakes? Please bomb Parliament; we don't want them, but we have to fit them; still, there's no reason why manufacturers should not fit two foot-controlled rear wheel brakes. Enclosed chains. Our public prefer them. A small percentage of our riders always pull the cases off as soon as they take delivery; if that type of rider predominates in Canada or other overseas markets, the trade ought to cater for him on their export models, but naked chains don't sell over here.

Circumstances Alter Cases.

ANALYSIS of the above criticisms suggests that the motor cycle is produced by its environment. Twist-grip control is more or less enforced by rough roads. If you adopt twist-grip control, you are limited to a semi-automatic or a one-lever carburetter. Big tyres may roll on a good road, but you put up with their roll on bad roads because they ease the jars. On rough roads you cannot spare a hand to fool with an oil-drip adjustment: indeed, on a surface like Applecross it is not easy to dab a pump handle down. If the local bumps are intolerable, frames must be sprung, whatever the additions may weigh or cost. If you belong to a new country with no foreign trade, you will develop a go-ahead spirit, and when your 1919 output is sold, you will ask, "Let us see, can I find a new market and double the output in 1920?" In which case your price will probably be cut rather fine, as several of your neighbours will be busy on similar lines. Finally, front brakes are quite safe (if rather futile) on decent going, and chain cases are a real advantage where there is no danger of their getting kinked or buckled by complicated tumbles: but no sane man wants either if he is going to blaze a trail from the Cape to Cairo.

The long and short of it is that the British bicycle grew up on British roads, which it suits jolly well: and the Yankee bicycle grew up under much rougher conditions, for which it was specially designed, and which it unquestionably fits. Unfortunately for us, the average British maker thought until yesterday that the best bicycle for Brixton was also the best bicycle for Buluwayo, and, anyhow, he did not much care

Occasional Comments.—

about Buluwayo so long as Brixton would sop up his output. Meantime the American bicycle suited the Overseas buyer, and the American maker was out for world markets, just as the N.S.U. people were ten years ago. By the irony of fate, just when the British maker has developed the imagination to visualise foreign markets and the ambition to covet them, war debts, reconstruction difficulties, and labour problems threaten to queer his pitch. Nevertheless, in twelve months' time I fancy my Canadian friend may find quite a few British twins to suit him.

Wider Frames Wanted?

PEOPLE are remarking that certain 1919 machines are too wide in the frame. Thus custom doth make fools of us all. The widest 1919 frame is narrower than the handle-bar span when all is said and done, and the machine can still thread the same old gaps in traffic. I wonder what the British working man would say if our electric trams were modelled on Irish jaunting cars, the passengers sitting back to back down the centre, with their feet and legs stuck out in the slipstream on footrests and footboards? Yet this asinine practice has been standard on 90% of our motor bicycles for twenty years. At last a few makers, led by A. A. Scott, have tumbled to our real needs, and widened the lower part of the frame to form a well in which our nether limbs are more or less protected from mud and dust and wind and rain. The merit of this is beyond controversy—it ought to have been done years ago. The only controversial point is concerned with the results of a crash. Sooner or later every machine comes a purler. Should the impact be taken by components vital to the structure

or by stuck-on gadgets of a bendable or cheaply replaceable character? This is something of a problem, and there are two schools of thought. A. A. Scott works on the lines of the anti-torpedo "blister" fitted to our super-Dreadnoughts: if his machine slides twenty yards on its shoulder, the main structure is immune, and the crash is taken by self-sacrificing parts which transform themselves into fenders for the occasion. On the new A.B.C. the frame itself stands the racket. Financially there is little in it. A new frame costs no more than a fresh set of mudshields, footboards, etc. On the other hand, it is easier to fit a few replacement gadgets than to strip a machine and re-erect its components on a new frame.

Friction Drive.

ONE of my technical friends gave me a rude shock last week. He is a cycle car enthusiast, and was hoping to give the ubiquitous sidecar a nasty knock with his new friction drive buggy. Like everybody else, he imagined that friction drive must be cheap because it is made of paper or cork instead of steel, and has got no teeth on it. Then he sent his buyers out to make tentative enquiries and got down to the facts. All the firms who compress sodden scrap blotting paper, or whatever the secret *compo* is, into shapely rings sent him sample disc faces and eke quotations for quantities. His own shops provided figures for steel rims, webs, hubs, and shifting gear. He scratched his head and stared at the figures till his eyes swam. There is not a fiver between friction drive and a pukka four-speed gear box for an 8 h.p. cycle car. In fact, supposing your shops are moderately equipped, there is not twopence between them. Quite a "have," was it not?

Sheffield section of the M.C.F.U. The run last week to the pretty village of Blyth proved a popular fixture. Nearly fifty machines were lined up on the village green during the course of the morning, sidecar outfits predominating.

Inset (left): On the road near Blyth Bridge. Inset (right): A lady member with her two-stroke Crescent. Her neat riding garb is worthy of note.

Now Ready the 1919 B.S.A. Catalogue

TO avoid anxiety follow the example of experienced riders and select a mount with a great record behind it. The fact that B.S.A. reliability has been demonstrated by thousands of machines on war service is proof that there is nothing freakish or experimental about B.S.A. Motor Bicycles.

THE B.S.A. Catalogue forms a reliable guide to the soundest and most progressive developments in motor cycle construction. All the latest refinements and exclusive features for which the B.S.A. name is famous are fully described, while the handsome colour plates showing the various models are undoubtedly the finest illustrations of motor bicycles ever published.

Write to-day for Catalogue.

THE BIRMINGHAM SMALL ARMS Co., Ltd., Small Heath, BIRMINGHAM

"Motor Cycling's"
opinion
of the 3 h.p.

"The **COMFORT** of the machine was really extraordinary, and our representative would not, previous to the trial, have believed it possible for him to have negotiated the road at such a speed without being thrown off

"The sense of **SECURITY** in going round corners was really extraordinary.

"The machine is capable of extraordinary **HIGH SPEEDS**.

"The performance for an engine of this size, and on a machine which is essentially suited for comfortable **TOURING**, is indeed a good one, and we cannot too much impress the fact that this speed and acceleration are not made at the sacrifice of the interests of the potterer.

"The **general running** of the machine was exceptionally sweet."

THE MOTOR SCOOTER.

PROPELLED PLATFORMS OR MINIATURE MOTOR CYCLES?

DAILY press scribes threaten us with an invasion of American motor scooters. Some would have us believe that they will eventually supplant the lightweight motor cycle as a utility machine: but we do not think that, while reliable and proved light-weights abound, the British public will follow the lead of Sir Henry Norman and Admiral Hall to the extent the lay press seems to think.

There is no doubt that the above-mentioned personages have been instrumental in focussing interest on the Auto-ped, to quote its proper name, the Motor Scooter being an appellation given to it by *The Motor Cycle*, when it first made its appearance in this country.

There may or may not be room in the field of motoring for machines of this type; of course, they are only fit for "pottering" about, but, like all novelties, they attract. Their success as a commercial proposition is another matter, and will depend upon their price, their mechanical efficiency, and their suitability for present day roads.

Why Stand?

The drawback of the "Scooter" in its present form is the fact that the rider is called upon to stand on its platform, and the majority may find it extremely fatiguing even for short distances. A question which naturally arises is "Why stand?" and, although we have asked this question many times, no satisfactory answer has been forthcoming.

Incidentally, the daily press once again shows itself ready to give credit to a foreigner when the credit is due at home. The scooter is a British idea—and an old one at that. The Max led in 1907, and appeared at the Stanley Show of that year. It was built for its inventor by Messrs. Douglas Brothers, of Bristol, and the engine was a 2½ h.p. J.A.P. It reappeared at the 1908 show, and one model had a folding saddle.

The Max was not the only machine of its type to be staged at the shows; the Moto-Frip, designed by a Mrs. Kent, was exhibited at the 1911 Olympia. This was a miniature tricycle fitted with a 1½ h.p. Moto-Rêve engine, one cylinder of the little twin having been removed.

The Auto-ped (motor scooter) used by sun bathers on the sands at Long Beach, U.S.A., in 1916.

In 1912 we published a cartoon in which the artist suggested a scooter "T.T.," and in 1916 we illustrated a motor scooter patented by Mr. J. Maina, of Brixton, which closely resembled the Auto-ped.

In the meantime America has also produced other designs and machines, one of which, the Mon-auto, provided a seat, but, as will be seen from the illustration on the next page, the riding position was somewhat cramped. In addition, American papers just to hand show the latest specification of a machine on similar lines, but designed to utilise an auto-wheel and a bucket seat.

If some enterprising maker will make a scooter, fit a saddle somewhat on the lines of the machine referred to last week as a super-scooter, and make a first-rate featherweight motor cycle of it, he will do well.

(Left) At the Stanley Shows of 1907 and 1908. The Max, upon which the driver had to stand.

(Right) The Moto-Frip, which was exhibited at Olympia in 1911. The engine was a little "two-cylinder" Moto-Reve, from which one of the cylinders had been removed.

The Motor Scooter.—

In the two-stroke engine he has the simplest form of power unit. There is much greater promise of success in this than in the scooter, pure and simple.

It is amusing that the "motor scooter" is now hailed as a new invention. Old readers of this journal know differently, as it was illustrated in *The Motor Cycle* over a dozen years ago. It is said that the Auto-ped has achieved great success in America, but confirmation of this point is lacking, and for the past two years the U.S. journals have scarcely referred to it. However, the success of an article in America is no reason why Great Britain should take it up.

The *Daily Mirror* prophesies that "Brighton, Southend, Clacton-on-Sea, and other holiday resorts will have to be enlarged to accommodate London's population of seven odd millions who will scoot there on Friday nights. And on Monday mornings these millions of breathless people will scoot back to work, invading London from the North, South, East, and West—vast dust-covered hordes of holiday makers."

Undoubtedly a great deal of piffle has been written concerning the scooter, and probably if the same energy and enthusiasm

were devoted to the lightweight motor cycle it would serve the public better. It would be interesting to read the reports of these writers after they have attempted a long journey standing on a scooter. It is not in this kind of motor-ing, however, that the scooter may score, but as a utility runabout machine for short distances between home and the office, or shopping centre.

If there is anything in the scooter idea, we have every confidence that the British motor cycle

The engine of the Auto-ped scooter. It was this type that Sir Henry Norman used recently in the streets of London.

industry will get its full share of the trade in it. Already several makers are keenly interested, and at least one British machine has been undergoing road tests for some time.

According to the designer, who, incidentally, is a staid thinking man, the little machine is capable of quite satisfactory speeds on country roads and will climb ordinary hills. Notwithstanding, we cannot think that the British public will be content for long to stand up, when by developing the scooter one stage further it can be made a comfortable and serviceable featherweight motor cycle, capable of moderate touring.

Naturally we welcome any addition to the scope of the motor-driven bicycle, and we are watching developments closely, but again we are constrained to ask "Why stand?"

As the Auto-ped is so constructed that it is very difficult from the exterior to understand "why the wheels go round," very few are acquainted with the inner mysteries of the mechanism.

As will be seen from the illustration on this page, the power unit is attached on the left side of the front wheel, whence the drive is conveyed through a dry plate clutch from a small pinion on the crankshaft to an internally-toothed drum secured to the front wheel itself.

The flywheel is located on the right side of the wheel, and embodies a flywheel type magneto.

The Gibson Mon - auto, an American 50 lb. £20 proposition.

The single-cylinder has a bore and stroke of 56 and 63 mm. respectively. Petrol reaches the automatic carburettor by gravity from a tank carried above the front wheel mudguard.

Tyres 15in. x 2 1/4in. are fitted. The internal expanding brake is operated, as is the disengagement of the clutch, by pulling the steering pillar backward and downward.

A motor scooter designed and patented by Mr. Joseph Maina, Brixton, London, in 1916.

THE BRITISH GOVERNMENT

during the war claimed the whole output of our works and enforced on us the renunciation of our extensive relations with the French and Italian Governments. The performance of

THE TRUSTY TRIUMPH

under strenuous active service conditions proved to our authorities that the TRIUMPH could be relied on to get there despite the wrecked roads, bad weather, and many handicaps of war-worn country.

Its easy start and quick get-away made it pre-eminently a machine for despatch running, while its bursts of speed and reserve power were certainly instrumental in saving the lives of our D.R.'s.

Our new models will retain all the merits of the war model, and be built to stand the same strenuous tests.

Nearly 2,000 Triumph agents in the British Isles are at your service. Why not have a chat with your nearest? He can give you all particulars and prices.

LONDON DEPOT: 218, Gt. Portland St., W.1.
Also at Leeds, Manchester, and Glasgow.

"The Motor Cycle," 27/3/19.

RECENT PATENTS.

REVIEWED BY B. H. DAVIES.

A FEW years ago there was a regular craze for a hobby known as "bent ironwork." Enthusiastic amateurs purchased bundles of strips of soft iron, a pair of shears, and a pair of flat-nosed pliers. They then proceeded to turn out candle-holders and easels, for photographs, which they presented to meek relations or dumped on unsuspecting bazaar committees. A crop of homicides followed, because, although such ornaments were beautiful when suitably gilded, it was quite impossible to keep their twined interstices clean, and irate housewives were consequently led to break up many happy homes. The motor cycle will ultimately perish for similar reasons, unless something is done to round off its innumerable spiky projections. Up to date, Mr. R. W. Coan has ploughed a lonely furrow, in advertising "Clean Crank Cases." Now Mr. Norton comes to his aid with a patent for cowlings in the top half of the engine. Fundamentally, of course, Mr. Norton's suggestion is of technical value. The rear wall of an air-cooled motor cycle cylinder lies in a patch of dead air. As the sketch shows, Mr. Norton proposes to fit a belt-driven fan at one side of the engine cowlings, and the rear wall

material. Now that most of our roads are bad, the Triumph people evidently feel that the action of their spring fork needs damping; and Mr. Stanley has

G. E. Stanley's shock absorber for spring forks. Patent No. 121,763. 2/11/17.

evolved a most ingenious device, which will unquestionably improve the fork over all kinds of road surface. Various applications of the idea are conceivable. In the form shown, the front end of the spring beds into a steel cap secured to the cross spindle at the head of the forks. When the front wheel passes over a bump, this cap is jerked backwards, and compresses the spring. Now we come to the braking action. At the centre of the spring cap is a coarse-threaded nut, riding on a coarse-threaded sleeve: the sleeve floats on the fore and aft spindle passing through the centre of the spring coils. When the spring cap moves towards the back of the machine over a hump, the nut at the centre of the cap must rotate the sleeve. The rear end of the sleeve bears hard against a bearing on the steering tube, and so the sleeve resists rotation by dint of end thrust. The spring can neither shut up nor rebound quickly, and "clashing" is obviated. If desired, a second spring can be fitted to damp the rebound still further. The whole mechanism can be packed with lubricant and encased. I shall be interested to see how the thread of the nut and the central part of the sleeve wear, but admit that several alternative applications of the principle are possible; and we all know that Triumphs never market a gadget which they have not tried out.

Mr. A. V. Watson is interested in the "obturator" type of piston ring. Before

the designers of air-cooled engines had learnt how to prevent distortion, they adopted flexible piston rings, so that the ring might automatically take up the varying clearance between piston and cylinder. The sketch shows the commonest type of obturator, consisting of a thin L shaped brass ring, located in an ordinary groove by an ordinary type of ring known as the "packing" ring. This pattern of obturator gave much trouble on aero engines, as its vertical flap met heavy weather on the upward stroke of the piston. One example of Mr. Watson's ring is illustrated. There is no "loose flap" to chafe on the up stroke of the piston, and the holes in the bevelled top corner of the channelled ring permit the explosion pressure to "inflate" the ring on the firing stroke, and so ensure a gastight fit for the piston. Of course the friction generated by such a ring flies right in the face of Mr. Ricardo's theories, and I doubt if obturators have any future on explosion engines: but the patent may prove useful on the pistons of certain types of pump. Distance pieces may be mounted between the channelled flanges to prevent collapse of the ring when the side wall wears out

A. V. Watson's obturator ring (on right) shown in comparison with a conventional Gnome type of obturator. Patent No. 122,054. 28/1/18.

Mr. N. Smith has patented a gadget for varying the compression ratio. In pre-war days expert riders often adjusted the ratio by utilising valve caps which projected into the valve chamber to different depths, or were machined hollow to different capacities; and the dodge was quite useful when the same engine

N. Smith's variable compression device. Patent No. 121,876. 18/3/18.

J. L. Norton's engine cooling device. Patent No. 122,072. 5/3/18.

of such a cylinder will be as well cooled as the front. He should presently offer us a cylinder cooled so evenly that distortion is imperceptible; needless to say, no motor cyclist has ever owned an engine of which this could be said. Riders will equally appreciate the ease of cleaning which such a design confers.

Mr. G. E. Stanley is taking the famous Triumph fork in hand. The current Triumph fork utilises a single coiled spring, which is compressed very rapidly over a really bad bump and rebounds with proportionate violence. In the old days, frightful pot-holes were the exception, and this "clashing" occurred so seldom on British roads as to be im-

A Batch of Patents.—

was used for such extremes as solo sprint hill-climbs and sidecar touring. The Smith patent is certainly preferable to such crude makeshifts, as it permits the rider to vary the ratio from the saddle by a large percentage. There should be no fear of leakage, as the piston ring is not subject to appreciable heat.

Laminated Valve Spring.

In the early days of motor cycling my chief hoodoo was the valve gear. It was a common occurrence for the timing pinions to strip their teeth, and one rider lost a fine chance of an End-to-end record because his valve tappets ate through the case-hardening of the cams and ploughed them down into circular discs. Rocking levers were presently interposed between the cam and the tappet to distribute the wear and furnish better leverage. I hope the patent under consideration may be understood to herald an overhead valve Norton engine in due course. However that may be, Mr. Norton proposes to use a laminated valve spring to act as a cam lever for an overhead valve as shown.

J. L. Norton's mechanically-operated overhead valve. Patent No. 122,379. 24/8/18.

The Swedish patent is perhaps too technical to interest the average reader. Briefly, before an engine can be made vibrationless, two sets of parts require to be balanced, viz., the rotating parts, e.g., the crank pin, which buzz round in a circle, and the reciprocating parts, e.g., the piston, which bob violently up and down. There is nothing new in balancing the crank pin, etc., by such a counterweight as is shown in the drawings. Mr. Morén, however, endeavours to balance the up and down parts by means of further counterweights, which slide in guides fixed inside the crank case; they are

Moren's balanced crank-pin. Patent No. 122,345. 30/5/18.

moved up and down to balance the piston by means of cams fixed to the crankshaft, and operating against cam-paths machined on the counterweights. The value of this patent rests upon compromise. Is the probable improvement in balance preferable to the frictional losses of heaving the counterweights up and down in their guides?

Mr. Radnall has patented the cradle method of mounting the engine, gear box, and magneto shown below. It has obvious advantages for assembling machines in the shops or for the private owner in home repairs. By

E. A. Radnall's cradle method of mounting the engine. Patent No. 122,276. 30/1/18.

knocking out four bolts the unit, consisting of engine, magneto, and gears, is dropped out of the frame, whilst either the magneto or front engine chains can be adjusted by slacking two bolts, and that without any fear of losing alignment. It is surprising that so simple a cradle has not been protected before.

Messrs. Alldays and Onions patent an attachment for sidecar connections, which

is self-explanatory. Four knuckle-headed pins are mounted at the usual points of the bicycle frame in any approved fashion. At the corresponding points of the sidecar frame are four tubular lugs recessed to house the knuckle-headed pins. Each lug is fitted with a spring-loaded cap, which locks the knuckle-headed pins into the recesses in the lugs. No tools are needed to detach the sidecar. The rider merely pushes back the spring-loaded caps, locks them back by means of a bayonet joint, and gives the chassis a wriggle, when the pins free themselves from the lugs. As often as not the sidecar should drop clear when the fourth cap is pushed back. Attachment is almost equally simple, as it is only necessary to lock back all the spring caps, register the pins with the lugs, and release the spring caps. The joint appears to be as safe as it is unquestionably simple.

Alldays and Onions sidecar coupling. Patent No. 122,286. 8/2/18.

The last patent in my week's bundle soars so far towards the ideal that it deserts the practical sphere, so far at least as motor cycles are concerned. It is the invention of Mr. Alfred Lewis, and when I say that it amounts to an infinitely variable gear, which automatically changes its own ratios in response to varying loads, every reader's mouth will begin to water. But if I add that this eminently desirable effect is obtained by means of an epicyclic train, which controls a second epicyclic train by means of a friction drive, and I further go on to say, with the Queen of Sheba, that the half has not yet been told you, and that the editor cannot spare me space for the diagrams needed to explain all the cams, springs, etc., concerned, well, the order of the day becomes, "Carry on with a common or garden Sturmey-Archer!"

MOTOR CYCLE DESIGNING IN THE FUTURE.

MR. L. B. HENDERSON, A.M.I.A.E., recently delivered a lecture on motor cycle design before the Sheffield District N.M.C.F.U., when he pointed out the need for more scientific design in the future, as in the past the motor cycle had not received the same careful consideration as the motor car. He referred to many engines being badly balanced, the chief offenders being single-cylinder and small V twins, necessitating unduly heavy frames to withstand the

stresses imposed upon them. The extravagance of present lubrication methods was also dealt with, the lecturer demonstrating how at practically no extra cost oil could be delivered exactly where required and diverted from those places where its presence was harmful. Mr. Henderson also criticised clutches, the alleged defects of mudguards, belts, brazed joints, springing, steering heads, etc. An interesting discussion followed, in which the importance of introducing

rustless and stainless steel into the manufacture of motor cycle components was mentioned.

The opinion was expressed that if motor cycle manufacturers do not pay more attention to scientific design and cleanliness, the motor cycle would be displaced by a small car, scientifically designed, with all mechanism fully enclosed, a minimum of unsprung weight, and costing no more to produce than a sidecar outfit of the same power.

Mr. F. A. R. Zurcher
—the Winner—

20,000
Miles on the
Road and
THEN —

THE

Douglas

BEATS ALL OTHER MAKES.

The biggest motor cycle event in Natal—The RUDGE Trophy Hill Climb, open to all makes of machines—has been won by F. A. R. Zurcher on his DOUGLAS. All the best known makes of machines were beaten by the little DOUGLAS—a 1914 model which had previously done over 20,000 miles on the road—which also captured the 350 c.c. Speed Trial.

Do you need further proof of Douglas Supremacy?

Register your name with Dept. "B" for our Peace Programme, which will be issued in the course of a few weeks.

In answering this advertisement it is desirable to mention "The Motor Cycle."

Taking The Clyno Point by Point

Quickly detachable and interchangeable 28" x 3" wheels, with VOITURETTE rims, are fitted. These have old steel hubs and large adjustable ball bearings.

This is the only bent tube in the principal frame structure. It supports the engine on one side and the gear bracket on the other.

The front down tube is 1 1/4" in diameter, and strengthened internally by high tensile steel tie bars. It is calculated to withstand any stress put upon it by the sidecar.

The 1" x 1/4" chains are entirely enclosed in strong metal cases, reinforced and built up on castings. This method of construction has proved to be highly successful on the Sidecar Machine Gun Outfit supplied by us to the Government. It makes for simplicity and easy removal.

The whole frame is of unusually substantial structure. Note the exceptionally strong head, which, whilst being massive, does not in any way detract from the pleasing appearance of the whole design.

Short springs with seven leaves are hinged at their rear ends on the side of a loop member which is pivoted at the end of the chain stays. This system is calculated to avoid any lateral play.

Note the angle of the cylinders. They are set at 42°, which, it is believed, is unique in British practice, the usual angle being 50°.

Of course it is not possible here to enter into a detailed description of the twin-cylinder, long-stroke engine, but expert motor engineers consider it is bristling with good points — exclusive features which will make for quite exceptional performance on the road. The Post-War Clyno, as

we have previously stated, is practically identical with that yet to be constructed combination, that has been specified and voted by experienced riders everywhere as representing the ideal machine.

Some Speed Sensations

The Three Factors in Producing "Thrills."

Some Psychological Considerations—Excitement at 6 m.p.h.—Boredom at 120 m.p.h.

MY brain box started bubbling as I read some criticisms by "Revs" on my colleague "Ixion's" notions of the sort of "hogbus" which ex-pilots would want after the war. "Ixion" thinks that a $3\frac{1}{2}$ h.p. machine is too slow for a man who has flown at over 100 m.p.h. His critic compares flying to sitting on a stationary platform and watching a map being slowly unrolled beneath. I enter the discussion without alarm, for I am going to pat them both on the back.

The psychology of speed is very puzzling until you have thought it out. When Mr. Locke King began to construct Brooklands with a banking calculated to hold cars swirling at 120 m.p.h., the "unco guid" held up pious hands in horror. A jaded earth was seeking a new sensation. The Roman amphitheatre, one

gathered, was a mothers' meeting compared to what a bloodthirsty gate would seek at Brooklands—ton-weight projectiles, belching oil fumes and thunder, careering round till the sole survivor of each race lifted the cup. We went to Brooklands, avid but shamefaced. What did we reap in the way of sensation? A bored Epsom bookie was heard to remark in disgust, "Look at them 'ere blinky beetles crawling round that unmentionable saucer." And he was right. The giant oval dwarfed cars and speeds alike. To get a real thrill at Brooklands, one had either to be in a car, or sticking one's nose through the palings, as a car doing not less than 100 m.p.h. hugged the inside edge fairly closely. Incidentally, this is just why Brooklands has never drawn really big crowds and never will: you get far more thrills to the square millimetre in watching a taxi take Piccadilly Circus at 25 m.p.h. The same applies to the Isle of Man. In the last T.T. car race I watched Lee-Guinness and others travelling up to at least 80 m.p.h. along roads which were mostly second grade lanes. Whether I got a breathless impression of speed depended very largely on where I stationed myself. If the standpoint gave a view of several square miles of country, the fastest car reminded one of the laborious progress of a rather lame cockroach. If you hid near a double corner, saw the car lurch suddenly into sight,

IMPRESSIONS OF SPEED IN THE TOURIST TROPHY RACE (I.O.M.)

Probably more thrills are experienced on the T.T. course than on Brooklands, both by the riders and spectators.

Some Speed Sensations.—

skid round, and vanish, your marrows quivered. If you sat in the front room of a house by the road, and got the swift blur and split second concussion as the car crossed the open window, you knew it was moving. Otherwise you generally got bored, and under-estimated the speeds by 50%.

So is it with flying also. Ask a steady pilot whose main job has been short distance reconnaissance at altitude near the lines, or ferry work, how he likes flying, and he will tell you in nine cases out of ten that he finds it supremely boring. Put him on a baby two-stroke in the City, and his manhood will respond to the danger and alertness which the job implies. "Revs" has probably flown under some such circumstances as I describe above. But ask a stunt merchant or a ground-straffer whether flying conveys any speed sensations, and his answer will be quite different. At 10,000 feet, or, indeed, well below that altitude, flying is very like sitting in a railway carriage and surveying a distant landscape through a telescope, except that you cannot smoke. But you get the speed thrill in stunting: low down, or in any sort of low altitude flying.

To sum up these peculiarities, there are really three quite distinct factors in the speed sensations which a motor cycle can convey. The first is association. If you are travelling faster than usual, the speed thrill gets you. So you are sure of it on the first few jaunts as a novice, for though you may only do 20 m.p.h., you never did as much as a push bicycle. If you are a staid old potterer, and your eldest boy whacks you to 30 m.p.h. when you give him his first motor, you get the speed thrill all over again. When you have habituated yourself in competition work or on lonely roads to know what a mile a minute feels like, this element vanishes out of your life: and, like first love, it never returns till you take to some faster projectile still, e.g., an aeroplane.

The Open Road and Traffic Riding.

The second is relativity—pardon a mouthful of a word. I mean speed in relation to surroundings. On the far-flung and almost vacant road across the Grampians, you can reel off mile after mile in less than 1m. 50s. without the faintest suggestion that you are going fast. But cross London in a hurry from, say, Bromley to Stanmore, and, though you may never exceed 25 m.p.h., you will develop just the same physiological symptoms as a T.T. winner, and your sensations will be very similar, although, instead of trying to cut down Tim Wood on a Scott, you are chasing a fat old tramcar in your anxiety to pass it before passengers flood the roadway at its next pull-up

post. For this reason you can get somewhat absurd speed thrills when a wheelbarrow runs away with you down a garden path, and miss them altogether when flying at 120 m.p.h. two miles up. I have risked my worthless neck an incredible number of times in all sorts of suicide 'buses on land, on sea, and in the air; but I never, never get the wind up so badly as when I am taking an S bend in a pony trap at 8 m.p.h.

The Influence of Danger.

The third factor, which overlaps the previous two to some extent, is danger. Once get the notion into your noddle that danger is afoot, and the basic elements of the speed thrill are there all right. I imagine that an intelligent child of, say, two and a half years, being wheeled a shade too fast in a pram by a flapper sister, occasionally feels just what a hedge-hopping pilot feels when he dives at the ground and begins his zoom a shade too late for comfort. Does not the sensation of having a large throbbing melon in your mouth arise when you tackle a greasy turn into your own front gate at 6 m.p.h. instead of 4 m.p.h.? Or when you set your speed rather finely to take a dry corner and the pot-holes in the road bounce your front wheel off the psychological line you had planned in your mind's eye?

There are other subsidiary factors. Noise is one of them. Open the throttle wide on a low gear, and, for preference, up one of those deceptive climbs where the surrounding country does not rise imperceptibly with the road. You note the engine bellow and whisper proudly to yourself, "She's doing a good 45." Then you look at the speedometer, and, though it is a generous liar, it cannot make your speed better than 32.

To sit in a low sidecar of a fast machine or in a speedy cycle car which occasionally rubs its stomach on the ground, will also produce speed thrills; especially if your driver, at 50, leans lovingly towards you to obtain ignition for his cigarette from your own. To be near the ground at 40 is as thrilling as 60 on a car, while 30 on a motor scooter no doubt will cause sensations equal to participating in a wild west show.

Nevertheless, broadly speaking, your hope of speed thrills depends upon travelling faster than usual, seeing near objects vanish fast (like the telegraph posts which a Yankee mistook for a high 'paling), and on a spice of danger. You get none of these in routine flight at altitude: you get them all in motor cycling under certain conditions. But the veteran motor cyclist cannot get them with a lightweight on the open road.

SIDECARRING IN BURMA.

In the most distant and out-of-the-way parts of the globe the sidecar is fast growing in popularity, and the B.S.A. outfit shown has proved its worth, both from business and pleasure points of view, on the frontier of the northern Shan states and other districts of Upper Burma.

THE MOTOR CYCLISTS' PARLIAMENT.

Annual General Meeting of the Auto-Cycle Union at Birmingham. Need for Stronger Provincial Element Confirmed.

THE provinces will be more strongly represented on the committee of the A.C.U. than has hitherto been the case, five of the twelve "individual" members elected for the ensuing year being well-known provincial motor cyclists. The election of these committee-men provided the most interesting item at the first annual general meeting of the Union to be held in the provinces, which took place last Saturday in Birmingham.

It was a cold, cheerless day, and the meeting was held in a cold, cheerless room in the Digheth Institute, which is located in a cold, cheerless part of the Midland metropolis. This combination of uninviting circumstances probably accounted for the attendance of about one hundred members only instead of a thousand, which could have been expected had conditions been more favourable. However, it was probably the largest annual general meeting in the history of the Auto Cycle Union, which alone justifies the decision to hold the meetings in different centres.

From All Quarters.

London was very strongly represented, however, while Liverpool, Birmingham, Wolverhampton, Coventry, Bristol, Nottingham, and Derby had their representatives. Maj.-Gen. Sir H. C. Holden, K.C.B., F.R.S., was in the chair, and among other well-known figures in the motor cycle world we noticed Majors Axford and Low, Messrs. H. G. Bell, Rex Mundy, A. V. Ebbelwhite, A. H. Lakeman, E. B. Ware, and W. H. Wells as part of the London contingent; Messrs. S. W. Philpott and V. Horsman from Liverpool; J. Simmonds from Nottingham; Capt. Geoffrey Smith and M. Sampson, Coventry; L. Wolstencroft, Derby; S. L. Bailey, Bristol; while Birmingham was represented by Majors Brook and Duke, Messrs. A. D. Arter, F. E. Baker, W. H. Egginton, P. J. Evans, J. L. Norton, P. Gai, J. Stevens, Alec Ross, F. Murray, and S. Rodway; Mr. J. E. Greenwood represented Wolverhampton. Among the many visitors there was Lt. Eno, of the U.S. Army.

The report referred to on page 303 was read by Mr. Loughborough and adopted.

It was moved that the Hon. Sir Arthur Stanley be re-elected president of the A.C.U. for the ensuing year, which was carried unanimously. Maj. Axford then read aloud a list of gentlemen suggested as vice-presidents, viz., Prof. C. V. Boys, F.R.S., Lt.-Col. A. E. Davidson, D.S.O., S. F. Edge, Esq., Sir H. C. Holden, K.C.B., F.R.S., Lt.-Col. D. F. Nicholl, D.S.O., Col. M. O'Gorman, C.B., J. R. Nisbet, Esq., G. F. Sharp, Esq., A. J. Wilson, Esq., Col. Lindsay Lloyd, C.M.G., J. W. Orde, Esq., and A. W. Torkington, Esq. These were seconded by Mr. F. E. Baker, and almost before the meeting realised that they had had an opportunity to nominate others, if they so desired, the nomination was carried *en bloc*.

It was clear that the London motor cyclists had come to Birmingham with

a set programme to obtain control as in the past—a policy which has not been at all popular, as it has been felt that with 15,000 members scattered all over the kingdom, it was not fair to them that the committee should be composed solely of London motor cyclists.

As has been mentioned by *The Motor Cycle*, the A.C.U. must live down the general impression that it is a London instead of a national organisation, and the only way to do this is for the provinces to have a voice in its management.

An R.A.C. guide at the door distributed cards which were reminiscent of electioneering practice. They read as follows: "I am all out for an ultra-efficient A.C.U. Among the host of good men who should represent you the following selection is offered for your guidance. If you know of better men—good enough; if not, plump for the following: Axford, Bailey, Brooker, Carter, Cooper, Feeny, Graham, Morgan, Olsson, Potter, Scott, and Ware. Yours, for efficiency, S. R. Axford (Major), O.B.E."

Of the eighteen nominations for the committee, the following were elected:

Maj. Axford (London).
S. L. Bailey (Bristol).
H. G. Bell (London).
J. W. G. Brooker (London).
W. Cooper (London).
S. W. Philpott (Liverpool).
Maj. Potter (London).
Alec Ross (Birmingham).
Capt. Geoffrey Smith (Coventry).
E. B. Ware (London).
W. H. Wells (London).
L. Wolstencroft (Derby).

Mr. A. W. Torkington, in presenting the balance-sheet, stated that in 1914 there was a loss of £700, and by a policy of rigid economy the committees, with the able assistance of Mr. Loughborough, the secretary, had been enabled to reduce this loss to *nil*. The balance-sheet he presented for the year ended December 31st, 1918, showed a surplus in hand of £180 19s. 2d., less debit balance on January 1st, 1918, of £24 4s. 4d., leaving a sum of £156 14s. 10d.

An Illuminating Address.

During the afternoon the members and visitors were addressed by Mr. E. S. Shrapnell-Smith and Mr. Samuel Henshaw, vice-president of the National Benzole Association, both of whom dwelt at length upon the importance of home-produced fuel. Mr. Shrapnell-Smith's discourse was most interesting, and we regret the space available will not permit a more complete report.

It was not possible to say how long it would be possible to stave off a benzole tax, but great efforts would be made to put back the supertax of 6d. per gallon on petrol.

The speaker made an interesting announcement which has not appeared in the press. This was to the effect that one of the main reasons why the County Council Association withheld their opposition to the Transport Bill was a minute sent to them by Sir Eric Geddes, in which

he stated that the Government will contribute half the cost of main roads and quarter the cost of secondary roads.

While calling for united action as a protection against unfair legislation, the speaker said motor cyclists should form a powerful federation under the A.C.U., distinct from car and commercial vehicle owners—a body standing out for itself, with a clear cut issue, because they ride the lightest motor vehicle.

As an example of what can be achieved by organised members, Mr. Shrapnell-Smith referred to the concessions obtained by the National Motor Cyclists' Fuel Union during the war.

A Benzole Campaign.

Mr. Samuel Henshaw, the vice-president of the Benzole Association, in the course of a long and educating lecture on benzole, said the future of home-produced fuel depended upon the attitude of motorists. It was with regret that he had to tell the meeting that the question of producing benzole from gas was in a very serious position. A good number of plants had shut down, and some had already been dismantled.

Mr. Henshaw endeavoured to show that the present price of benzole was reasonable, but he was not too convincing on this point. He made the important announcement that a company had been formed, which we gathered would be known as the National Benzole Co., for the sole purpose of distributing benzole, and that the new company would open depots in all important centres, with the result that in a very short time it would be possible to purchase benzole in the company's two-gallon sealed tins.

Home-produced Fuels for the Six Days Trials.

Mr. Loughborough expressed an opinion that the ultimate solution to the fuel problem would be alcohol, which, of course, was not suitable for present-day engines, but in the meantime a mixture of alcohol and benzole would be a useful fuel to combat the present high price of petrol. It was quite likely that the 1919 A.C.U. Six Days would be open to members who will agree to run on home-produced fuel alone.

Several other gentlemen, including Maj. Axford, addressed the meeting; which closed about 6.30 with a vote of thanks to the chairman and various speakers.

THE DISPOSAL OF ARMY MOTOR CYCLES.

AT the sale of Army motor cycles held last week at the Agricultural Hall, good prices were again realised. The machines were in the main Rudge Multis, Scotts, and Zeniths, the latter making an average of about forty guineas. Bids from nineteen and a half guineas to fourteen and a half guineas covered the prices that ranged for the Scotts.

A good deal of humour was caused when purchasers of decrepit mounts attempted to wheel the machines home.

The annual Spring Number of *The Motor Cycle* will be published on Thursday next, the 3rd prox.

Motor Cyclist's Loss of Notes.

Despite advertised rewards, C. R. Collier has obtained no tidings of a bundle of notes, value £116, that he lost after the sale of a motor cycle at Plumstead.

The First Post-war Competition.

To the Cork and District M.C.C. is due the honour of being the club to hold the first post-war reliability trial, which was held on St. Patrick's Day.

Motor Cycling in Belgium.

Belgian motor cyclists, including the passenger in the sidecar, must possess a special permit to travel. These permits have to be obtained from the police station nearest to the place where the driver and his companion reside.

Missing Attache Case.

The hon. secretary of the N.M.C.F.U., Coventry branch, advises us that he lost his attaché case containing important papers at the meet at the Stonebridge Hotel on the 16th inst. It is thought that this was taken by someone in mistake, and that this person will be glad to know the address of its owner, which is 32, King Richard Street, Coventry.

Competition Hill Revisited.

Rex Mundy, the popular rider, is now touring the country on behalf of the A.C.U. He is mounted on a Victory model Matchless, shown on page 312, which, although a new machine, satisfied Mundy as to its power on hills. Being in Cheltenham, the ex-competition rider was tempted to test its capabilities in some of the Colmore Cup trial hills on the Cotswolds, and as the weather and road conditions are now similar to those under which the Colmore Cup was run in pre-war days, he made a short *détour* to take in Gambles Lane (Rising Sun Hill), which he found in a very bad condition. Notwithstanding, Mundy tells us that the Matchless "went up like a bird." It is in revisiting such hills as Gambles Lane that the old competition rider renews the thrills of achievement of by-gone days.

£80 Sidecar.

The writer of "Answers to Correspondents" in a provincial daily evidently has a wrong idea of values. He mentions the price of a 7-9 h.p. machine as £80, or with sidecar £160. We extend our sympathy. We, too, know the difficulty of answering correspondence outside our special sphere. Only last week we were asked to give legal advice concerning divorce proceedings!

Unusual Incident in Dublin.

Two R.A.F. lieutenants had an unpleasant experience recently in Dublin. They were being driven in a sidecar by a sergeant of the R.A.F. when they came into conflict with a crowd watching a funeral cortège. Misunderstanding the instructions of a constable on point duty, the sergeant did not stop, and the on-lookers expressed themselves very strongly on what they considered to be an intrusion among the mourners. The sergeant was dragged from the machine, and sticks were brandished over the heads of the officers. Some members of the crowd took the machine, the quay wall and dropped it into the Liffey.

Special Features.

THE MOTOR SCOOTER.
SOME SPEED SENSATIONS.
THE ENGINE OF THE SIDECAR.

Levis Prices.

The price of the Popular 2½ h.p. Levis is now £44 13s.

A.C.U. Six Days' Trial.

This annual reliability trial, as already stated, will be arranged from a centre in Wales next August or September. In framing the regulations special attention will be paid to light-weights and low-priced machines.

Sale of Motor Cycles at Colchester.

A two days' sale of motor cars, motor cycles, bicycles, and accessories was held at the newly opened motor repository, Maidenburgh Street, Colchester, by Mr. Harry Reeman. A Rover combination Douglas £49, 1914 Sunbeam combination £95, and an Enfield combination £95. The next sale will take place on Thursday, April 10th.

Birmingham N.M.C.F.U. meet last week-end. Inset, Mr. Murray, the hon. sec. of the Birmingham Centre, addressing the members from the Stonebridge Hotel on the "Ways and Communications Bill."

Found.

Mr. A. G. Laverack, of 123, Hewett Road, Harringay, has in his possession four pairs of new Aero piston rings for different engines, which he found in Palmer's Green.

M.C. and A.C. Trial.

A permit has been granted to the Midland Cycle and Athletic Club to hold an open one-day trial on Saturday, June 28th. Maj. Duke has been invited to act as steward for the A.C.U.

The Essex Motor Club.

The Essex Motor Club are holding a dinner at Frascati's Restaurant on Saturday, April 5th. We are asked specially to mention that all members who have served in H.M. Forces are invited to the dinner.

Light Cars and the A.C.U.

Maj. A. M. Low, Messrs. A. V. Ebbelwhite, J. W. G. Brooker, and E. M. P. Boileau have been appointed to represent the A.C.U. on the R.A.C. Competitions Committee on matters connected with light cars.

Sale of U.S.A. Government Motor Cycles.

The United States Liquidation Commission have directed that fifty-eight sidecar outfits be sold by auction at the sale rooms of the Grabame-White Co., Ltd., London Aerodrome, Hendon, on Tuesday, April 1st, at 11 a.m. These machines will be on view Friday, Saturday, and Monday prior to sale. It is announced that sales will take place every Tuesday fortnight.

A Trial of Stock Machines.

On several occasions attempts have been made to organise a trial for standard motor cycles as sold to the public, and the Auto-Cycle Union has been asked more than once to run its Six Days Trials for this type alone. Up to the present, however, nothing has been done in the matter, as it was felt that the A.C.U. was a body the object of which was to improve the breed of the motor cycle, and that it should do its utmost to encourage progress as far as possible; consequently the Union gladly accepted entries from makers of their next year's models, which would not, at the time be sold to the general public.

This is still the general feeling, but the suggestion, which was made by a prominent manufacturer the other day, is a good one, and the A.C.U. should not lose sight of the fact that a stock machine trial would be one of considerable value, and whenever it may be possible to arrange such an event, it would be exceedingly beneficial both to trade and public to do so.

In our opinion, such a competition would best take the form of a one-day trial of motor cycles chosen from manufacturers' stocks of new machines ready for delivery to the public. Such competitions have been run with considerable success in America, and might well be equally successful in this country. A trial of this nature would eliminate departures from standard practice introduced for a specially arduous trial, and a good idea of the performances of the standard makes in skilful hands would then be available to the public.

**AN ELECTRIC BATH CHAIR.**

This little runabout is intended primarily for the use of invalids or for pleasure purposes on good roads. It is driven by an electric motor through a chain to one of the road wheels, and has two speeds and a reverse. The battery is capable of propelling the machine from twenty to thirty miles without recharging. The frame is of steel and the seats are supported on spiral springs.

A New Route.

The county of Notts is to receive £100,000 of the ten million grant by the Government to the cost of road and bridge repairs. Of this sum £50,000 is to be spent in completely resurfacing the road from Nottingham to Bawtry with Tarmac. Sections of the road near Retford, over-grown with grass, have only recently been re-opened by the county council, thus giving Nottingham a direct route to the Great North Road.

Bat Redivivus.

After having been dormant for several years during the war, the Bat Motor Manufacturing Co. is again taking up the manufacture of motor bicycles. Mr. T. H. Tessier will no longer be connected with the firm, but he has been of considerable assistance to it in the process of reorganising, while Mr. S. T. Tessier, his son, will be responsible for the design and production of Bat motor bicycles in the future. Bat motor bicycles have been on the market continuously since 1902, and it is pleasing to note that this well-known name will again figure in the motor cycle world, and that one of the Tessier family, so long connected with this make, will remain a member of the firm. S. T. Tessier, who has been serving his King and country through the whole period of the war, was a consistent and successful exponent of Bat motor bicycles up to 1914. Two models will be manufactured—an 8 h.p. sidecar combination, price £135, and a two-speed 5 h.p. solo machine, price £90.

The Late Dr. W. Watson.

It is with great regret that we learn of the death of Professor W. Watson, D.Sc., C.M.G., F.R.S., of the Imperial College of Science and Technology, South Kensington, formerly chairman of the Expert and Technical Committee of the Royal Automobile Club, and a well-known

authority on scientific matters, including internal combustion engines. Dr. Watson was one of those brilliant scientists who lent his aid to the motor cycle movement, and acted as one of the judges in the A.C.U. Silencer Trials of 1907 and 1913. He was a delightful man, and one whose ability could be hardly guessed in the course of a conversation, but his work for his country has been most valuable, and in no small way contributed to his early death, which was hastened by his experiments in poison gases. Early in the war he was gazetted Temp. Lt.-Col., and became Director of the Central Laboratory, General Headquarters, France.

The Arbuthnot Trophy.

Considerable progress has been made in the organisation of this competition, and very valuable assistance has been rendered by officers of the R.N. undergoing training at Cambridge University. The prime mover of the "Cambridge Navy" is Sub.-Lt. Glen Kidstone, R.N., who served with the late Rear Admiral Sir R. K. Arbuthnot in H.M.S. *Orion*.

It has been decided that the competition will extend over two days, will be held in the West of England, and will be open to solo motor cycles only, so as to emphasise the sporting side of the pastime. The competition will run to a broad schedule, and a winner will be decided on reliability and performance in a flexible hill-climb. In working out the results the cubical capacity of the engines will also be taken into consideration. These technical details are in the able hands of Major A. M. Low, R.A.F., and Mr. A. V. Ebbelwhite. The actual venue of the competition will be announced later, as will also be the exact date, though it has been decided to hold the event in July. The entry fees are £1 1s.

Full particulars can be obtained from the secretary, the Auto-Cycle Union, 83, Pall Mall, London, S.W.1.

Hamilton and District M.C.C.

An effort is being made by the late hon. sec., Mr. J. Law, to reorganise the Hamilton Club. Interested motor cyclists should communicate with this gentleman at Carmaben, Low Waters, Hamilton.

Woolwich M.C.C. (Ladies' Section).

The increasing number of girl motor cyclists on solo mounts is noticeable in S. London. A ladies' section of the Woolwich club has been formed by Mrs. Hardee. Mr. Collier, sen. (of Matchless fame), is presenting a cup for competition, ladies' section v. men's section.

Middlesbrough and District M.C.C.

Activities were recently resumed by the holding of a general meeting. Mr. John Giers was elected president; Messrs. Sidler, Scott, McAdams, Armstrong, vice-presidents; Messrs. Close and Randall, hon. secs.; Mr. J. Gilchrist, captain; and Mr. F. Nixon, vice-captain. It was agreed to protest against the Transport Bill. Twenty-five new members were elected.

Carlyle (Chelsea) C. and M.C.C.

A dance has been arranged to be held in the Chelsea Town Hall on April 11th. Tickets (3s.) obtainable from the hon. sec., Mr. T. Lifferty, 7, Vale Terrace, King's Road, Chelsea. A temporary fixture list, covering April and May, has been arranged, and includes the following: April 20th, run to Guildford; April 27th, Leatherhead; May 4th, Merstham; May 18th, Dorking. Members leave the Fox and Hounds, Putney, at 10.45 a.m. It is hoped to organise picnic runs during the summer. Captain of motor cycle section, Mr. A. E. Littleboy, 8, Fulham Park Garden, S.W.6.

Cork and District M.C.C.

Good weather favoured the Cork and District M.C.C. for its first post-war trial, which was held on St. Patrick's Day, for which there were twenty-seven entrants on machines ranging from a Baby Levis to 7 h.p. Indians. A secret check five and a half miles from the start caught a few competitors napping, and Whitaker (1913 T.T. Triumph) fell foul of a cow and suffered minor damages. Duggan (6 h.p. Enfield sc.) was late at the finish, and was reported held up with a broken chain, while Swanton (3½ h.p. Indian sc.) was also in trouble with his sidecar connections. Subject to confirmation by the Club Committee the results were as follows: 1st, M. J. Hegarty (Baby Levis), New Hudson cup and medal; 2nd, J. P. Frost (6 h.p. Enfield sc.), sidecar prize; E. B. Russell (4 h.p. Triumph), club prize; H. C. Johnson (2½ h.p. Revere), lightweight prize; W. P. Musgrave (4 h.p. Triumph sc.), novice prize; R. Barrett (6 h.p. Enfield sc.), President's prize.

Future Events.

- Mar. 27.—N.M.C.F.U., Leeds. *Whist Drive and Dance.*
 Mar. 30.—N.M.C.F.U., Sheffield. *Run to Matlock.*
 Mar. 30.—Manchester M.C. Rally.
 Mar. 30.—Woolwich, Plumstead, and District M.C. Hill-climb.
 April 5.—Birmingham M.C.C. *Opening Run to Stratford-on-Avon.*
 April 5.—Cumberland County M.C.C. *Special Meeting, Crown and Mitre Hotel, Carlisle, at 6.30.*
 April 5.—Essex Motor Club. *Victory Dinner at Frascati's, Oxford St., W.*
 April 6.—The M.C.C. *Opening Run to Hatfield.*
 April 6.—Woolwich, Plumstead, and District M.C. *Non-stop Trial from Knockholt to Lamberhurst and Back.*
 April 9.—Liverpool M.C. *Annual Meeting, Law Association Rooms.*
 April 9.—York and District M.C. *Opening Run to Farndale.*
 April 11.—Carlyle C. and M.C.C. (Chelsea). *Dance at Chelsea Town Hall.*
 April 13.—Liverpool M.C. *Opening Run.*
 April 13.—Essex M.C. *Opening Run.*
 April 18.—Dorington B. and M.C. *Opening Run.*
 April 20.—Carlyle C. and M.C.C. (Chelsea). *Run to Guildford.*

Manchester M.C.

The opening rally and reunion of members will be at the Swan Hotel, Bucklow Hill, at 2.30 p.m., on Sunday, March 30th.

Active members (old and new), as well as prospective members, are particularly invited to turn up to arrange for the season's programme. The honorary secretary is Mr. Fred A. Eltoft, 133, Oswald Road, Chorlton-cum-Hardy, Manchester.

Essex M.C.

A Victory dinner has been arranged by the above club, to be held at Frascati's Restaurant, Oxford Street, W., on Saturday evening, April 5th, and it is hoped that as many members and friends as possible will take this opportunity of being present. It has been decided that all members on the club's books in August, 1914, who have served in His Majesty's Army, Navy, or Air Force, either abroad or at home, shall receive a free invitation, and the honorary secretary requests that all who are so entitled shall apply to him for tickets not later than the 29th inst., at "Holme Villa," Algiers Road, Loughton. Other tickets can be obtained either from the honorary secretary, or from Mr. F. A. Applebee at 203, Great Portland Street, W., at 8s. 6d. each. An excellent musical programme is being arranged.

The opening run will take place on April 13th, leaving the headquarters, "The Eagle," Snaresbrook, at 11 a.m.

Sutton Coldfield and Mid-Warwickshire A.C.

This club is resuming activities. It has a large potential membership, and it is hoped shortly to revive the Colmore cup trial. The secretary is Mr. F. W. Finnemore, C.A., 122, Colmore Row, Birmingham.

Glasgow M.C.C.

Before the war the Glasgow M.C.C. was one of the largest in the kingdom. It has, unfortunately, lost a considerable number of members on service, including its energetic and popular secretary, Mr. E. W. Theim. The club is now being reorganised.

South Birmingham M.C.C.

About fifty members attended the recent general meeting, and it was apparent that the revival of the club created very keen interest. A great deal of trouble had been taken by several energetic members to collect and clean the trophies and cups for the meeting, which undoubtedly had the effect of stimulating interest in the club. A committee nucleus has been elected, and a further meeting has been called this week to frame a programme, which will include competitions and social events. The following officers have been elected: President, Sir Hallowell Rogers, M.P.; hon. sec. and organiser, E. C. F. Boydell, 93, John Bright Street, Birmingham; hon. treasurer, J. Parman; captain, H. Warden. The headquarters of the club are at the Mermaid Hotel, Stratford Road, Sparkhill, Birmingham.

The Motor Cycling Club.

Members are again reminded of the opening run to the Red Lion Hotel, Hatfield, to take place on April 6th. Those desiring luncheon must apply for tickets beforehand to Mr. A. C. Armstrong, 7, Rosebery Avenue, E.C.4.

The Motor Cycling Club held two concerts last week, which mark the beginning of its new phase of activity after the war. The first, last Wednesday, followed a dinner given to past and present members of the committee. The other concert took place in the Queen's Hall on Friday night, and was attended by some 1,200 people. It was quite the largest affair of this nature which has ever been held by a motor cycling club. The programme, as may be expected, was a first-class one, and the evening was thoroughly enjoyed by the large audience which was present.

In the course of the performance a collection was made for St. Dunstan's Hostel for Blinded Soldiers and Sailors, and a goodly sum was realised for this deserving institution. Quite a number of well-known motor cyclists were present. The chair was taken by Lt.-Col. Charles Jarrott, C.B.E., R.A.F., president of the M.C.C.

DUNLOP MOTOR CYCLE TUBES.

FOUR IMPORTANT POINTS:

1. Every tube is moulded to the exact shape of the cover.
2. There's no undue stress at any point of the tube when it is under pressure.
3. Each size and each section is designed to fit the appropriate cover perfectly.
4. Each tube is of full section size.

Good tubes these! The same care is given to their manufacture as to Dunlop rubber-studded motor cycle covers.

Prices for tubes of the following sizes:

	26 x 2"	26 x 2 $\frac{1}{4}$ "	26 x 2 $\frac{1}{2}$ "
			(to fit 2 $\frac{1}{2}$ " rim)
Endless	8/9	10/3	11/9
Butt-ended	11/9	13/3	15/-

NORTON MOTORS, LTD.,

PHILLIPS STREET, ASTON, BIRMINGHAM.

London Agents : G. B. BARTLETT & Co., 74, Gt. Portland St.

A scene at the start of the Cork and District M.C.C. opening trial. This was the first of the post-war trials to be held in the United Kingdom.

Wath and District M.C.C.

The opening run of the above club will be to the Dnkeries on Friday, April 18th. Hon. sec., Mr. W. W. Evers, 8, Sandygate, Wath-on-Dearne.

Cumberland County M.C.C.

The committee of this club has arranged to hold a special meeting at the club's headquarters, Crown and Mitre Hotel, Carlisle, on Saturday, April 5th, at 6.30 p.m. All motor cyclists are invited. Hon. sec., Mr. T. Rutherford, 15, Blackfriars Street, Carlisle.

N.M.C.F.U. (Leeds).

Fixtures include a run to Richmond on April 18th and to Scarborough on April 20th. The start is from the Clock Tower, Roundhay Park. The hon. sec. is Mr. T. W. Lancaster, 7, Evelyn Street, Chapel-town Road, Leeds.

Liverpool M.C.

A very successful concert was held on March 19th at St. Margaret's Hall, Park Way, Liverpool, under the auspices of the Liverpool M.C. There were about 300 people present, and a very entertaining programme was arranged by Mr. G. Freeman.

Mr. S. W. Phillpott, president of the club, addressed the assembly. The Liverpool M.C., he said, is the outcome of an amalgamation of four Liverpool motor clubs: the Mersey (Liverpool) M.C., the Liverpool Amateur M.C.C., the Liverpool A.C.C., and the Liverpool Volunteer M.C.C. The funds of each of these clubs had been put together, and were now in the hands of the Liverpool M.C., which is affiliated to the Auto Cycle Union and associated with the Royal Automobile Club, and gives the full advantage of each of these governing bodies, in addition to their own advantages.

Coventry and Warwickshire M.C.

The annual general meeting of the Coventry and Warwickshire Motor Club will be held to-morrow (Friday) at the Towers, Warwick Road, Coventry, by kind permission of the C. and M.C.M. and T.U., Ltd.

This meeting will, in effect, be the revival of this well-known club, the activities of which have necessarily been restricted during the past few years. It is hoped that all present and prospective members will make a point of attending.

It has been decided that the first fifty new members will be admitted without payment of an entrance fee, and that the annual subscription for all members shall be 10s. 6d. Forms of application for membership may be had from the hon. sec., 19, Hertford Street, Coventry.

Mr. Edward Manville, M.P., has kindly consented to be president for the year.

Birmingham M.C.C.

The opening run to Stratford-on-Avon on Saturday, April 5th, is open to all motor cyclists, members and non-members, and it is hoped there will be a huge muster.

To add more interest to this run it is decided to couple with it a speed judging test, to be held on a section of road on the outward journey. Silver prizes will be awarded both to members and non-members.

The start will take place at 3 p.m. from the Nag's Head, Hockley Heath, Stratford Road, ten miles from Birmingham. There will be no entry fees.

It is essential that all motor cyclists who intend to participate should send their names and addresses to the hon. sec., Mr. W. H. Egginton, 76, Earlsbury Gardens, Birchfields, Birmingham, not later than March 29th, to enable suitable arrangements to be made.

The A.C.U. Sixteenth Annual Report.

THE war work of the A.C.U. has been constantly referred to in *The Motor Cycle*. According to the Sixteenth Annual Report, just to hand, the Union is at the beginning of another chapter in its career, and the opportunity which is now presented to make it an even greater force for justice and freedom in the cause of the motor cycle than in pre-war days has been fully appreciated by the Committee.

The A.C.U. is well aware of the value of united and organised effort by all bodies representative of automobilism. The Union has regularly attended all the General Motor Conferences which have been held since the autumn of 1915, and is directly represented on the Motor Legislation Committee. The immediate objects of this co-operation have been the removal of war restrictions on the use of motor vehicles, restoring the roads, and a plentiful supply of fuel.

The A.C.U. has gone ahead well as regards membership since the war finished, and at the time of writing the total paid-up membership numbers 15,859. No elections have occurred since 1916-17, so that in the current year a new Committee will be elected. Almost the last

work of the retiring Committee has been to provide for meetings of the General Committee being held in provincial centres as well as in London, and this scheme will be submitted to the new Committee for consideration and approval.

Appreciation of the Motor Messengers.

Briefly referring to the war work of the Union, it may be mentioned that the total mileage covered by the A.C.U. Motor Messenger Detachment of the R.A.C. War Service was 192,768 miles. The Service has now been suspended, and the following is an extract from a letter received from the G.P.O.:

"The Postmaster General desires me to take this opportunity of expressing his appreciation of the great services rendered to the Post Office during a time of national emergency, and he asks that you will be so good as to convey his thanks to all those concerned who have so efficiently assisted him in maintaining the Telegraph service often under trying conditions."

The report concludes by eulogising the work of the motor cyclists in the British Army, and the Union is proud of their success, because, long before the war, it

recognised the military value of the motor cycle.

Much Touring but no T.T.

Naturally the Touring Department of the Union is engaged in preparing for a busy time in the coming season, and is revising its hotel and repairers' appointments. Unfortunately, it has been impossible to issue a 1919 edition of the "Touring Guide," but it is hoped to publish a supplement embodying up-to-date information during the summer.

The Technical Committee has done a great amount of work in examining second-hand cars for prospective purchasers, and a "catalogue reference library" has been installed embracing the catalogues of all motor cycle manufacturers.

So far as competitions are concerned, the committee regret that, in fairness to the British motor cycle trade generally, they have not seen their way to holding the Tourist Trophy Race in 1919. Arrangements, however, are being made to resume the annual Six Days' Trials, and every encouragement will be given to clubs to revive their sporting activities.

The A.C.U. accounts for the year show a satisfactory balance sheet and a surplus of nearly £191.

IMPROVING THE SIDECAR OUTFIT.

The best sidecar machine specification in the Suggestions Competition invited in connection with our "Which Type" referendum.

IN the sidecar class the ideas submitted were not so profuse with regard to the actual sidecar improvements, most of the suggestions affecting the cycle unit, the requirements of which naturally differ greatly from those of the solo machine. The winner of this section is Major P. H. Lewis, R.E., who details a very complete specification, which is given below.

1. A rustless finish throughout can be obtained as under : (a) All bolts, screws, and nuts (except those inside the engine and gear box, which are always under oil), brake rims and drums, belt pulleys, footrests, pedal levers, and other parts which are liable to friction or abrasion, to be made of stainless steel; (b) rims, either aluminium alloy (e.g., Roman rims) or stainless steel; (c) mudguards of aluminium—they could be of a solid construction without being very different in weight, either way, from steel guards: enamel is seldom satisfactory on sheet metal, as it cracks at the edges, and is also affected by bending of the sheets; (d) handle-bars, hubs, hand levers, and other suitable parts to be covered with celluloid, as on the Rudge; (e) enamel is satisfactory for the frame members; (f) waterproof hubs, with large lubricators designed to take the nozzle of a grease gun; (g) plating is only suitable for springs, and these should be enclosed in leather gaiters and packed with grease.

2. Crank case and gear box should be integral, the base carrying in one casting the gear box, clutch, kick starter mechanism (only the crank and pedal being exposed), first step of the transmission (which should be by gearing, to avoid the necessity for adjustment), oil sump, pump, and lubricating arrangements for gears as well as engine. The whole power unit, in running order, should be readily removable from the frame.

3. The tank should be of the saddle type, and about 10in. wide towards the front, tapering to the rear. A toolbox should be built in one with the tank, on the top at the widest part. Toolbox to be about 10in. x 10in. x 3in.

Saddle tank, embodying toolbox.

deep, sheet metal outside, lined wood, with wooden pockets to hold all necessary tools and small spares. The lid to be fitted with a transparent top, and form a map case, so that the map can be read from the saddle without opening the case.

4. Tank capacity should be $2\frac{1}{2}$ gallons for a medium or heavy weight, the oil being carried in the crank case sump; the last half-gallon of fuel to be available only on turning on a second tap.

5. Filler cap should be at least 2in. in diameter, and towards the rear on the right-hand side of the tank top (the sidecar being on the left). This is for convenience of filling.

6. The number of sizes of nuts to be reduced to a minimum, and all should be placed so that they can be dealt with by an ordinary spanner. One small four-size spanner and one large double-ended loop spanner (for plugs, valve caps, etc.) should be enough to deal with all nuts.

7. Disc wheels.

8. Automatic spark control. There is a definite correct spark timing for every engine speed in a given engine, and this should not require to be controlled by the rider. Magneto systems have been made already with automatic control.

9. Mechanical lubrication, giving forced feed from a crank case sump to all parts of the engine and gear box; the whole arrangement contained within the power unit.

10. Rear mudguard should be extra wide and shallow, built on to the carrier, and continuous at its front end with an undershield. The undershield should close all the space between the footboards, to which it is fastened, curve up in front of the crank case, and also extend into leg shields, as on the Sunbeam.

11. The combined magneto and lighting dynamo should be enclosed in the flywheel. A complete set of electric lamps should be fitted, the head light having a double filament bulb; the high-power filament to be connected so that it is only run by the dynamo. When the dynamo is cut out, the bulbs kept running by the battery should all be of low consumption—hence the battery can be small.

Rear guard, undershield, and leg shield integral.

12. Elimination of clips, small bolts, and nuts and screws, for securing accessories, control levers, etc., i.e., accessories built as part of the machine, is very desirable.

13. The sidecar to be fitted with quick detachable fittings, using brazed lugs on the bicycle. When the sidecar is detached, there should be no loose fittings left on the bicycle, and the latter must be immediately fit to ride solo (e.g., if the battery is carried on the sidecar, it must be capable of being transferred in a few seconds to the bicycle). The sidecar should be regarded as an accessory.

14. Single lever carburetter.

15. Half compression device operated automatically by pressure on the kick-starter.

16. Spring frame—the rear wheel being carried in a rigid triangular frame pivoting on a substantial bearing at the bottom bracket—this being the only pivot on which the rigidity of the frame depends. Carrier to be sprung.

17. Chain drives to be by "silent" chain.

18. Belt drives. Minimum belt sizes: $3\frac{1}{2}$ h.p., 1in.; 5-6 h.p., 1 $\frac{1}{2}$ in.; 7-9 h.p., 1 $\frac{3}{4}$ in.

19. Tyre sizes: $3\frac{1}{2}$ h.p., 2 $\frac{1}{2}$ in. or 650 x 65 mm.; sidecars of higher power, 28in. x 3in.

The two main elements of a flywheel magneto.

20. Silent valve gear; fibre caps on the tappets.

21. Helically cut gear wheels—for silence.

22. Gear control—more particularly for a two-speed—should be by means of a handle-bar lever fitted with a retaining catch, as with the present handle-bar clutch control, but with three positions—lever down, high speed; middle position, neutral; lever up, low gear. This control is more particularly for gears such as the Enfield, which have a non-positive engagement, and so replace the clutch. An alternative control might be by toe and heel pedal.

The outstanding features of these suggestions clearly indicate the more urgent problems requiring attention, which are (a) better mudguarding, (b) rustproof finish, (c) more substantial bearing construction, (d) improved transmission systems, and (e) standardisation of small parts such as nuts, etc. These apply equally to the solo and sidecar mounts. As regards the sidecar, the more prominent features are (a) the method of attachment to machines, (b) springing, (c) accommodation, and (d) ground clearance.

"THE TYRE WITH NINE LIVES"

In answering this advertisement it is desirable to mention "The Motor Cycle."

A Commentary based upon Impressions formed after Chats with Manufacturers since the Signing of the Armistice.

Conditions of Overseas Trade.

WHILE a certain number of motor cycle makers in this country are already exporting a proportion of their machines, there appears a tendency at the present time for the majority to overlook the urgency for renewing their export business. With one or two exceptions, they appear to be content to try to cope with the home demand, which they consider will give them far less trouble. Although regrettable, this is perhaps only natural at a time when outputs could be disposed of several times over to buyers in the home country and, while it may not be the soundest business policy, it is the easiest, and, sad to relate, the British motor cycle industry seems to lean toward the line of least resistance.

There are several other reasons, however, why the British motor cycle maker will be late in entering Overseas markets. First, conditions have altered since the makers had their last business dealings with colonial buyers, and much preliminary work in connection with arranging agencies will be necessary. Secondly, Overseas business has not been entirely satisfactory in the past. Thirdly, makers wish to restart their export business on new lines. Fourthly, there is a great deal of trouble in connection with shipping and Government Departments. Finally, there is the question of packing in closed cases at a time when suitable labour is not easily obtainable and timber at a premium and difficult to secure.

Depletion of Office Staffs.

EVEN with the home markets, the makers have not settled down to proper business methods—office staffs have to be re-organised; there are still many gaps in their organisations which they are keeping open for their old servants who are still with the Colours, and they are content to "carry on" as best they can for the time being and dispose of their output to those British agents who "worry them" most.

From the foregoing, it must not be thought that Overseas trade is being neglected, but rather that up to the present makers have not had time seriously to consider the matter. The question of the moment is output, and they can sell all they can make at home without much assistance from their sales organisations which, at the present time, only exist in a nucleus state.

It must not be forgotten that, during the war, office staffs were more disorganised than works *personnel*, and such persons as export managers were among the first to join the Colours or have their

services diverted into channels more useful to a country at war. Many companies to-day find great difficulty in answering foreign and colonial correspondence for the reason that the men who handled it in pre-war days are not now with them. The export packers, too, left the packing shops to meet the Government's call for wood-workers for the construction of aeroplanes. Many of them are now skilled men in the latter line, and will not go back to packing, which comes under the semi-skilled class of work for which lower rates of wages prevail.

Much Ground Regained. UNDER these circumstances, it is easy to be to understand why the average manufacturer procrastinates where Overseas trade is concerned, especially when the old Colonial buyers, having experienced the different methods of American makers during the war, make certain demands relating to supplies of spare parts and alterations to standard design.

It is perhaps only human for the maker to hesitate at the present time, when Overseas business means so much preparation to be satisfactory and the results are not likely to accrue until the next financial year. Makers have lost several months in this financial year, and it is only natural that, to satisfy their shareholders, they wish to make up for lost ground in the quickest possible manner—and that is in the home trade.

A Better and More Far-sighted Policy. AGAINST such a policy much can be said, and we think that, when it becomes absolutely necessary for the makers to find Overseas outlets for their products,

they will experience considerable trouble in recapturing markets which are in danger of being lost. The far-seeing business man appreciates that *now* is the time to lay the foundations of future success, and is catering for Empire trade by exporting a certain proportion of his output, even if he makes less profit on it than upon sales in Great Britain. The loss, if loss it can be termed, he will suffer this year will be very small in proportion to the amount it will cost to enter the Overseas field a few years hence.

For these reasons—and also because we know the Overseas buyer deserves the same consideration as the home buyer—we recommend every motor cycle maker in this country who has suitable Overseas models to look further ahead than he is wont to do. "Sufficient unto the day" should not be the motto of the motor cycle industry of this country.

A Selection of Letters from Readers scattered all over the World.

British Motor Cycles in Canada.

MR. WALLACE R. WARNE, 423, Annette Street, West Toronto, Canada, writes: "As the fact that I advertised for a Triumph motor cycle has already been proclaimed in the pages of the 'Blue 'Un,' it may interest you to know how I was impressed by the machine—a 1913 three-speed model—which came into my possession.

"I suppose this machine would now be considered somewhat antiquated in the Homeland, but it had seen very little service, and proved to be in excellent condition. As winter set in shortly after I bought it, I ran it down into the cellar, and proceeded to acquaint myself with its internals. I found everything in such good order that, beyond removing carbon, I was unable to effect any improvement. Meantime, my admiration for British workmanship was considerably enhanced.

"Before reassembling, I had the cylinder nickel-plated—its appearance being thereby greatly improved—and inserted closely coiled aluminium wire between the fins to assist radiation. I also removed the pedals and chain, and fitted an extra pair of footrests in their place, which served to modernise the appearance of the machine and gave me the option of several changes of position when riding.

"I quickly took exception to the method of releasing crank case pressure through the centre of the engine pulley, which sprinkled me liberally with oil, and drilled and tapped a hole in the rear of the cylinder near the base. Into this, by means of a small brass union, I fitted a piece of $\frac{1}{4}$ in. copper tubing through which the oil spray is blown on to the ground, resulting in a remarkably clean engine.

"Another 'stunt' I adopted was to pack the inside of the valve springs with waste, which I occasionally saturate with oil. This not only lubricates the stems, but protects them from dust and mud, and keeps them in fine condition.

"I have ridden the machine 4,178 miles. Oil consumption was less than one and a half gallons, and a gallon of petrol generally carried me 125 miles. My only troubles were a broken rear axle and a carrier, which persistently misbehaved, breaking at different times in no fewer than four places. The engine cannot be too highly praised. It ran from beginning to finish absolutely without attention. I did not even have to decarbonise it.

"While I consider the Triumph an excellent mount for solo work on good roads, I must endorse the common idea that, for all-round use over all kinds of Canadian roads, a machine in the neighbourhood of 8 h.p. is necessary. A sidecar, with telescopic axle, is desirable for serious touring, as it is often almost impossible to negotiate deep sand or badly rutted roads on a single-track machine. That we must have spring frames, ample ground clearance, extra strong wheels, and large tyres goes without saying.

"I found your 'Reconstruction Number' most interesting, and am very pleased to note that British manufacturers are at last evincing some interest in the Canadian market along the lines I have previously advocated.

"I wish *The Motor Cycle* the success it unquestionably merits, and hope before long to see numbers of British machines that have hitherto been strangers to us."

Eighteen Months on Electrical Henderson.

MR. C. RUSSELL, Sydney, N.S.W., writes: "I decided to sell my light car and buy a Henderson, mainly because I leave home on Sunday morning at six o'clock for a day's fishing, and require something to climb cliffs, traverse bush paddocks, and do general acrobatics. My wife, who always accompanies me, was game to take 'the risk.' We are still going strong!

"Well, this is what I think of it. I use 760 x 90 mm. tyres, and find the mudguard clearance insufficient. I have scrapped the flapper bracket and tail light, and it takes exactly three minutes to detach the back wheel. Also fitted longer rockers on the front fork tips. The dynamo is perfect, no trouble with lighting at any time. The chains stretch considerably. I have used two so far. Schebler carburetter good. The clutch was bad for the first few months. Then I ditched the leaves. It now works perfectly, and I do nearly all driving on top gear. I can do 4 m.p.h. on top with the clutch slipping evenly and smoothly. Of course, if I have to start up on a 1 in 3, or steeper grade, I have to use low gear. I have taken the engine down five times so far, not because

it needed it, but because of a habit I have. The piston tops were very rough, so I have ground them level and polished them; consequently, now have less carbon. All bearings are as new, and will probably outlast the frame. By the way, I have had trouble with the steering head ball races. The gear box (three-speed) is foolproof and gives no trouble, but I would prefer a friction drive in conjunction with a cog drive for starting and steep hills. Consumption, about 45 m.p.g. I have heard that others get up to 90 m.p.g., but I cannot do this on the roads I have to traverse.

"The outfit and sundries cost me £160, but compared with a two-cylinder it was cheap.

"If I can ever procure an English four-cylinder, 28 in. wheels, grip control, foot clutch, foot brake, 10 h.p., good mudguard clearance, it is mine; but it may be another 100 years, alas!"

Prices of New Machines.

MR. E. F. JENKINS, of *The Cape Times*, Cape Town, S.A., writes: "May I beg of you on behalf of colonial riders to add to the good work you are doing on behalf of the motor cycling movement by using your utmost influence with the British manufacturers to keep their prices down to the smallest possible figure? The prices of new machines as announced in your columns have filled us with dismay, and we are wondering what we shall be asked to pay for post-war models. Fortunately for the English maker, the South African agents of American motor bicycles seem to be slow in cutting prices. £110 is the retail price of a 7 h.p. Harley-Davidson solo. We have had to put up with American components for a couple of years past and the result has been to enhance the reputation of British goods, whose superiority in the way of chains has been particularly marked. I would suggest that the motor cycle manufacturers fix the prices, beyond which their machines shall not be sold retail."

The Motor Cycle and American Riders.

MR. A. ANDERSON, 630, Bingham Street, Reading, Pa., U.S.A., writes: "While in the service of the United States Army at the training school for motor cycle mechanics at Pittsburg, I became acquainted with a man who has been getting your journal for four years. I do not recall his name, but he gave me your New York address. I brought a copy home with me, and the Reading Motor Cycle Club, of which I am a member, voted at once to subscribe to it. We are very pleased with it. As you know, Reading is the home of the Reading Standard, and I believe you will admit it has got some pep. Out of 200 members of the club 75% were in the Service. We are one of the leading clubs in the country for boosting the sport, and have a busy season in front of us in the line of racing and endurance runs. We are always on the lookout for something new, and that is our reason for subscribing to *The Motor Cycle*. We find it a change from our magazines at home.

"Well, I have told you enough. I hope if you find room you will place this little expression in your paper."

Mr. Harold Burrow, of Dunedin, N.Z., aboard his Indian sidecar. He was the winner of a recent reliability trial from Dunedin to Timaru and back, a distance of 258 miles.

ROYAL RUBY

2½ H.P. 2-STROKE LIGHTWEIGHT An opportunity for Easter.

Those looking forward to the Easter holiday will find the Royal Ruby 2-stroke single-speed Lightweight just what they are wanting. With the Royal Ruby special frame with Patent Safety Stays, Villiers 2½ h.p. 2-stroke engine, Dunlop motorcyclette 26in. x 2in. B.E. tyres, Dunlop belt, and Brooks saddle, it is, without question, at £40 nett cash, the best value on the market.

The G.N. is exceptionally accessible. The detachable cylinder head, always a feature of the G.N. engine, and now being widely adopted by other makers, is extremely simple to detach, no skill, either, is needed in re-making the joint. Decarbonisation is thus doubly simplified, for not only is the head easier to detach than the ordinary cylinder, but the carbonised surfaces are immediately "getatable."

In the event of tyre trouble, the easily detachable wheel can be replaced by the spare, which procedure will appeal to owners of sidecars, combinations, in which structural design impedes tyre replacement. Further details and specifications from

A SCOOTER CARTOON OF 1912

Twelve years ago a mild enthusiasm was created by the advent of the motor scooter. No one took it seriously, however, and we reproduce a sketch that appeared in *The Motor Cycle* in the issue of March 21st, 1912, humorously depicting the contortions of a rider as he might appear in a scooter T.T. race.

ALUMINIUM ENGINES.

THE one direction in which there seems promise of considerable improvement in motor cycle design is that of weight reduction. In trying to reduce the weight of a machine there could be no better starting point than on the engine, as this is the heaviest individual part. Improved engines mean smaller engines, which in turn mean smaller and lighter machines, as the frame, wheels, etc., have less to carry.

When the price of aluminium comes down again to a reasonable figure—and there is no reason why it should not be even cheaper than in pre-war days—engines constructed mainly of aluminium may be developed. It is an open question whether aluminium cylinders need have iron liners.

It would seem that if an aluminium alloy, having bearing properties like those used for pistons, were used, the requisite durability might be obtained without liners.

It is said that with cast iron pistons in aluminium cylinders the wear on the cylinder walls certainly would be less than the wear on an aluminium piston in a cast iron cylinder. Gudgeon pin bearings directly on the aluminium of the piston bosses are now successfully used, and the pressure on these bearings is considerably greater than the pressure on the cylinder walls, though the surface speed, of course, is naturally less. With cast iron pistons in an aluminium cylinder, exactly the same bearing conditions as with aluminium pistons in a cast iron cylinder prevail; but as cast iron on cast iron has good bearing properties it is not improbable that aluminium alloy would give equally satisfactory results.

Before the war experiments were being made in this country with an "all-aluminium" car engine, in which cylinders, water jackets, crank case, pistons, and even the valves were of aluminium alloy.

VEDETTE.

ROAD REPORTS.

West of England.—We have received information that the following roads are in an exceedingly bad condition: Both roads from Barnstaple to Ilfracombe, Barnstaple to Combe Martin, Barnstaple to Lynton, and all roads in a triangle drawn from Barnstaple, with Ilfracombe and Lynton as the ends of the base. The road along the coast from Combe Martin to Ilfracombe is impassable, owing to a landslide, and will be out of repair for many months.

Main road from Reading to Exeter.—In good condition as far as Hungerford, then bad to Pewsey. Improved surface from Pewsey to Westbury, and fair to poor between the latter and Castle Cary. From Castle Cary to Ilminster, good. From Ilminster the road becomes hilly and of uneven surface, though it improves about five miles before Honiton. Between Honiton and Exeter, good Tarmac surface. Bad through Honiton.

Exeter to Dartmouth.—On the whole, fair. Very bad until two miles out of Exeter, when the surface improves. Tramlines at Torquay and Paignton (coast route); rather trying with a lightweight. Fair from Paignton to Dartmouth.

From Exeter to Bath *via* Taunton and Shepton Mallet.—Good main road to Taunton, with a few bad patches. These are being rectified, however. Taunton to Shepton Mallet, fair, but good in parts. Shepton Mallet to Bath, bad, especially through Radstock. Condition of roads into, through, and out of Bath very bad, with large pot-holes.

Bath to Chippenham.—Good.

Chippenham to Oxford *via* Calne and Swindon.—Chippenham to Calne, good. From Calne to Swindon through Wootton Bassett, *very bad indeed*. Bad through Swindon, and then indifferent, with good and bad stretches, to Oxford.

Bristol Road from Worcester to Birmingham, fairly good, excepting in suburbs of Birmingham.

Uxbridge.—Tram lines in Uxbridge very bad.

Oxford Road in very bad condition, near Gerrard's Cross almost unrideable. Oxford to Cheltenham, quite good.

Birmingham.—The Chester Road, in the vicinity of Erdington and between Erdington and Castle Bromwich, is beyond description.

Lancashire. Liverpool-Southport (*via* Aintree and Maghull).—Very good condition.

Manchester to Southport.—Route *via* Chorley recommended. Turn left in Irlam avoids Bolton. From Chorley *via* Croston. Plenty of signposts.

Southport to Stockport, *via* Ormskirk and St. Helens, Great Sankey, Warrington, Altrincham, Cheadle, Heath Station, and Stockport.—Very good to St. Helens, but painful exit for one mile. Remainder very good. Alternative route *via* Knowsley village and Prescot recommended. Turn right at Rainford. Adds two miles.

Warrington to Prescot.—In perfect condition.

Prescot to Liverpool.—Poor.

Manchester to Northwich.—In perfect condition.

Oswestry to Birkenhead.—Majority very good, but the stretch from Cefn to Ruabon is simply atrocious.

Chester to Birkenhead.—Very good.

Extracts from a Paper read Last Week before the Institution of Automobile Engineers, and the Discussion which followed.

ON Thursday of last week, at the Chamber of Commerce, Birmingham, Mr. Eric Caudwell read an interesting paper on the engine of the sidecar machine, which, more or less, was a sequel to the general survey and criticism of the motor cycle that was made by Mr. D. S. Heather in his paper read before the same body on February 20th.

"Probably because the motor cycle is much less developed, the average purchaser is far more critical than the purchaser of a car," said Mr. Caudwell. "Now the engine of such a car is practically free from mechanical noises, is so well balanced as to operate over its whole speed range without sufficient vibration to cause inconvenience, is flexible, and will give a practically constant torque over at least half its revolution range, will run 5,000 miles without requiring to have the carbon cleaned out or the valves ground, and 10,000 miles without dismantling for adjustment of any of the working parts: its lubrication is entirely automatic, and needs no attention on the part of the driver except an occasional replenishment of the oil supply, and, once the carburetter is correctly set, no skill is required for its manipulation, while all the working parts are entirely enclosed, and no adjustments are necessary between the periodic overhauls."

To show that this ideal is attainable by the motor cycle engine, and to indicate the lines along which it may be reached, was the purpose of Mr. Caudwell's paper.

Only engines of over 500 c.c. piston displacement were dealt with, as with the volumetric efficiencies at present attained, a smaller engine was considered quite unsuitable for serious sidecar work.

Cylinder Cooling.

"Air-cooled engines only are dealt with," said Mr. Caudwell, "as sufficient experience has now been acquired to show that in the range of sizes under discussion, water cooling is a quite unnecessary elaboration. Air cooling would be perfectly satisfactory under right conditions, but very little attention appears to have been given to it by the designers of motor cycle engines."

"A careful examination of a cylinder of, say, a 1906 $3\frac{1}{2}$ h.p. Minerva engine and any 1919 cylinder shows no essential difference whatever in design except that the valves and passages are slightly larger, but the pitch, number and disposition of the cooling ribs, and the thickness of the walls, remain practically

Graph showing the tractive effort of a 4 h.p. motor cycle engine in relation to road speed.

unchanged. It is really surprising that engines keep as cool as they do when the obstructions to the direct flow of air to them are considered, the cylinder being usually placed behind a tube which is not streamlined, while in front of that is a mudguard, which may be anything up to 8 in. wide, and might have been designed for the express purpose of acting as a scoop to deflect the air away from the cylinder, while the magneto is also frequently placed in front. In the same way there are tubes and mudguards in the rear to obstruct the closing in of the slip-stream, if one should ever be formed. It is to be seriously questioned if our much talked of experience with air-cooled engines during the war has taught us a great deal that will be of use when applied commercially. Better cooling is undoubtedly badly needed, as

it will give longer life of valves, less carbonisation, and, in permitting the use of a higher compression ratio, will improve thermal efficiencies."

As an indication of the large scope for improvement, Mr. Caudwell gave a chart showing the tractive effort of a 4 h.p. motor cycle engine. This is reproduced here, and it will be noted that, while it amounts to 90 lb. at 18 m.p.h., it falls away steadily until at the very moderate speed of 36 m.p.h. it has dropped to 64 lb., showing that, as the engine revolutions increase, the mean effective pressure steadily decreases. This indicates not only inefficient cooling, but restrictions in the valve ports and passages. As a fully laden sidecar outfit may weigh 700 lb., the commencing values are quite creditable, but the engine should hold its torque over a considerable range before the curve turns downwards.

The speaker had many things to say about engine balancing and crank effort, and his deductions were made from examination of various modern engines. His remarks on these subjects were very interesting, and may form the subject of a separate article in a subsequent issue.

Crankshafts and Flywheels.

Mr. Caudwell said he could not understand why makers of single-cylinder and V twin-cylinder engines, with few exceptions, have always placed the flywheels inside the crank case. "The disadvantages of this method of construction are numerous and obvious," he said, "while advantages seem to be non-existent. A car engine with an 85 mm. bore cylinder has a crank pin about 2 in. diameter by 2 $\frac{1}{2}$ in. long, so that it is extraordinary that there should be many thousands of motor cycle engines running with crank pins only $\frac{3}{4}$ in. in diameter by 1 $\frac{1}{2}$ in. long, and still more extraordinary that, although the oil is only fed in a most erratic manner with a hand pump, they may yet last 5,000 miles without requiring renewal—that is, about six months' work for a fairly hard rider. Although some improvement has been effected by the use of roller bearings, these can hardly be regarded as a satisfactory solution of the problem in view of their small size and the heavy loads and shocks to which they are subjected."

The placing of the flywheels inside the crank case means, too, that the diameter cannot exceed about eight inches, so that they have to be unduly heavy. The average weight is from 25 to 35 lb. the pair, which is about one-

Section of crank, piston, and connecting rod of a 90 mm. x 130 mm. car engine and 85 mm. x 98 mm. motor cycle engine. Both are drawn to the same scale.

What do you know about your motor?

An Important Work for every Motor Cyclist

The time is past when it required an expert engineer to drive a car, but a working knowledge of the various parts of a car and their functions is still essential to really successful driving, and the importance of this work to every owner and driver of a motor car, cycle, or cycle car can hardly be over-estimated.

"The Book of the Motor Car" is the first really comprehensive work on motor cars, cycle cars, and motor cycles ever published. By the careful study of its chapters the rawest amateur can learn the principles upon which his car works; but at the same time it is so comprehensive and so striking in its detail that even the skilled man will find it a book of enthralling interest and extreme utility, while the practical motorist will find it quite indispensable. It should be as much a part of the equipment of a garage as an oilcan or a lifting jack. Reading its chapters, even the most expert driver will find himself gaining a fuller understanding of points that he thought he understood already, and learning hints that will enable him to increase the efficiency of his mount in a surprising manner.

Driving and Repairs.

"The Book of the Motor Car" is full of invaluable information on all problems of driving and repairing a car, instructions being given for all possible difficulties in language that can be understood even by the most unmechanical mind. The following are a few of the subjects dealt with:

Cylinders, valves of all kinds, different types of engines, carburetters, ignition, silencers, gear and clutches, radiators, cooling systems, brakes, lubrication, lighting systems, wheels, tyres, fuels and how to use them, tools, and repair appliances, etc., etc.

Cycle Cars and Motor Cycles.

The work pays full attention to motor cycles and cycle cars, full details and instruction being given for all those points wherein they must be treated differently from the most powerful motor car. In these and all other respects "The Book of the Motor Car" is in line with the very latest discoveries in motor engineering. It is profusely illustrated with full-page plates, drawings, in plan section and elevation, diagrams, and photographs, as well as a series of sectional movable models in colour.

A FREE BOOKLET.

The publishers are willing to send an interesting illustrated booklet describing the work to all sending this form or a postcard

To the Caxton Publishing Co., Ltd.,
75, Surrey Street, London, W.C.2.

Please send me, free of charge and without any obligation on my part, your illustrated booklet giving full particulars of "The Book of the Motor Car."

RENOLD CHAINS FOR THE MOTOR CYCLE

QUALITY.

The high place held by the Renold Motor Cycle Chains is due to the extreme care in selection of material and the great degree of accuracy in manufacture.

We are constantly analysing and experimenting with steel in order that we may utilise only the highest quality in the manufacture of

THE RENOLD CHAIN.

The supply of "Renold" Chains is once more available, so be sure to specify them on your Motor Cycle, and make sure you get them.

HANS RENOLD, LTD., DIDSbury, MANCHESTER.

LEEDS OFFICE: WESTMINSTER BUILDINGS, EAST PARADE.

DEEDS, NOT WORDS.

Burnley, 17/3/19.

Dear Sirs,

I have decided to send the Douglas Machine per passenger train, as I find that it takes about 14 days to send goods to London, therefore I thought this would be best.

I have packed engine in good strong case, and trust same will arrive well.

Thanking you very much for your prompt attention to all my letters, and the business-like way you carry things out.

Yours faithfully,
(Signed) H.T.

(Original or above letter may be seen at our offices.)

If you are interested, call and see us.

VIVIAN HARDIE, LTD. Douglas Experts.

Showrooms: 24, WOODSTOCK ST. (off Oxford St.), BOND ST., LONDON, W.1. Telephone: Mayfair 6559.

Works & Garage: 8, Duke's Mews, Duke St., W.1 (back of Selfridge's).

MOTOR CYCLE

ACCESORIES.

The accessories of a motor cycle are of two kinds—necessities and luxuries. Amongst the foremost of the former is an Insurance Policy in a substantial office giving full and complete cover. Both these conditions are fulfilled in the Pooling Insurance Policies. Cost price Insurance always.—Licenses and General Insurance Co., Ltd., 24, Moorgate Street, E.C.2.

The Engine of the Sidecar Motor Cycle.

third the total weight of the engine. Bearing sizes, too, seem quite inadequate, although these are usually of the ball or roller type. Although it is a wonderful testimonial for the makers that these bearings may have a life of over 10,000 miles.

Piston and Connecting Rod.

"The restrictions connected with the use of internal flywheels limit the distance between them to about 3in., so that the connecting rod is not wide

Cross section of the 7 F.N.

enough to resist transverse strains. This results in the rod springing, so that it is usual to find that the gudgeon pin is not parallel with the crank pin after a very little use."

In Mr. Caudwell's opinion, the lubrication of most English engines seemed to be in an embryonic state, and that the Americans have a decided advantage, as mechanical oiling is universal on their machines.

The speaker thought that in the motor cycle sizes of engines there was no need to consider forced lubrication, the trough system being adequate.

Mr. Caudwell stated that of all types of engines the single was heaviest, largely on account of the heavy flywheels required, especially when placed inside the crank case. One popular engine weighed 68 lb., but the average, he said, was 85 lb. The V twin was somewhat better, the average weight being about 100 lb. for the 1,000 c.c. engine. He could not give the weight of flat twins, but the four-cylinder, he said, was the lightest of all. The 1,170 c.c. four-cylinder Henderson, complete with clutch, gear box, kick starter, magneto, carburetter, and silencer, weighed only 128 lb.

In concluding, Mr. Caudwell said: "Our requirements are fulfilled in the largest measure, and about equally, by the flat twin and four-cylinder engines. The flat twin engine has certain advantages in the way of fewer working parts, but, as generally placed, the cooling of the back cylinder is very inefficient, and the cylinder is also inaccessible; in fact, it cannot be removed without taking the engine out of the frame.

"Doubts are often expressed as to the advisability of placing a four-cylinder engine in the hands of an unmechanical public, but the success of the owner-driven light car should be sufficient to dispel any fears on this score.

"When the motor cycle becomes as good as the car it will be similarly left alone, except by the negligible few."

THE DISCUSSION.

The discussion which followed the reading of the paper, while interesting, was more of a general nature than one would have expected from an assembly of upwards of a hundred members of the manufacturing trade. Among others present we noticed Messrs. V. A. Holroyd (Rudge), George Stevens (A.J.S.), G. E. Stanley (Triumph), T. W. Blumfield (Abingdon Ecco), J. E. Greenwood (Sunbeam), Norman Downes (New Imperial), G. E. Evans (O.K.), W. Hughes Butterfield (Levis), J. Duffy (Valveless), J. Clarke (Ariel), A. A. Austin (Coventry Simplex), — Ireland (Thomson-Bennett), Alec Ross, and Major Axford.

Mr. V. A. Holroyd, called upon by the Chairman (Mr. A. A. Remington) to open the discussion, said he could not understand why Mr. Caudwell should expect motor cycle engine makers to embody crank pins 2in. diameter when present-day machines gave the service they did. On the question of inside flywheels, Mr. Holroyd pointed out that the designers' scope was limited to a large extent by the ground clearance on the one hand and the tank on the other. He agreed that the next step in motor cycle design might be a four-cylinder machine with shaft drive which would eliminate chains and chain cases.

Mr. George Stevens agreed with this latter statement from Mr. Holroyd, but he added a rider to the effect that, after all, a motor cycle is not a car, and that most motor cyclists could not afford such a machine. The single and twin, Mr. Stevens said, were comparatively cheap to produce, because they were simple, and whatever developments there might be in four-cylinders, there would be a big demand for the simpler type for some time to come. Admitted, a motor cycle is not so clean as a car, but he questioned whether motor cyclists expected this.

The power plant of the Henderson four-cylinder motor cycle.

Mr. J. E. Greenwood agreed with most of Mr. Caudwell's paper concerning four-cylinder engines from an idealist's point of view, but as a commercial proposition it was a very different matter. The single of 500 to 600 c.c., he maintained, was simple, economical, and reliable, and although theoretically it was impossible to balance, the bad balance could be reduced. He mentioned one factor which was not frequently referred to as a point in connection with the balance of a single: this was that the centre of the mass weight of the flywheels being in a direct line with the centre of the reciprocating mass, the anvil action of the flywheels absorbed a very large proportion of the vibration caused by the unbalanced reciprocating mass.

Mr. Blumfield referred to the limitations in space to embody larger bearing surfaces, but he did not know of any design which embodied bearings of the size quoted in the paper. In reply to the contention of the author that motor cycles were in constant need of attention, Mr. Blumfield thought they would be much better if left alone by their owners.

Mr. G. E. Evans, of Messrs. Humphries and Dawes, said it was futile to compare a motor cycle with a car, and cited the single as being probably the most reliable machine suitable for the man in the street, and that, irrespective of other developments, it would retain its prominence in the motor cycle world.

The four-cylinder machine was coming, thought Mr. Butterfield, but it would be expensive. There was no doubt about the market, as there was always a class of buyer prepared to pay high for an ideal machine.

Mr. G. E. Stanley suggested that in some respects the car engineers had much to learn from the motor cycle engineers rather than the other way round, while Major Axford stoutly defended the modern motor cycle, and referred to its economy in upkeep, especially as regards overhauling and replacement parts, as compared with a car. He thought Mr. Caudwell was chasing a shadow, and that the two types of vehicles were entirely distinct.

Other speakers included Messrs. J. Clarke, A. A. Austin, and D. S. Heather.

In his reply, Mr. Caudwell stated that to imagine that all motor cyclists are sportsmen was a mistake, and that makers will not tap the largest market until they cater for men who are not sportsmen. In reply to the several suggestions that the four-cylinder would be expensive, he said the price of the pre-war 7 h.p. F.N. was £78, and that the American Henderson also was sold at a price competitive with other types. He agreed that singles and twins did their work well, but suggested that we wanted something better.

THE 1919 J.A.P. LIGHTWEIGHT ENGINE.

Increased Radiating Surface — Chain-driven Magneto — Improved Valve Lifter.

The new 2½ h.p. J.A.P. engine of 292 c.c.

being more aptly rated in the future at 2½ h.p. Its bore and stroke are 70 mm. x 76 mm., and the magneto, which was formerly gear-driven, is now chain-driven, the cover of the chain casing serving as part and parcel of the timing gear cover and forming also a platform for the magneto.

Exhaust Valve Lifter.

The engine has been improved further by the fitting of a simple and ingenious internal exhaust lift, and the provision of two bearings for the large timing wheel spindle, one in the inside of the timing gear case and the other in the cover. The boss of the latter serves as a bearing for the lever, of which the cam forms a part, actuating against the heel of the exhaust rocker, thus serving to raise the exhaust valve.

In our illustration the ingenious Bowden wire fitment and the internal exhaust cam lifter are clearly shown. The crank case

Chain drive for magneto replaces the gear drive of the earlier models.

AFTER years of war and munition work it was distinctly refreshing to be able to go through Messrs. J. A. Prestwich's works at Northumberland Park, Tottenham, London, N.W.17, and see the old familiar parts on practically every machine tool, showing great activity in the factory and a rapid production of J.A.P. engines.

The little 2½ h.p. has progressed considerably in design, so much so that certain modifications in the cylinder, such as the increased size of the radiating fins, have resulted in the engine

Timing gear of the new J.A.P. lightweight engine, showing integral magneto platform and timing case cover.

of this engine is now entirely oil-tight, and on referring to one of the photographs it will be seen that a special oil ring is cast on the pulley side of the crank case, so as to catch any excess of oil which might leak through and drain it neatly away without soiling the crank case. Some improvement has also been effected in the silencer, which is now of ample dimensions and of pressed steel. The valves are large, and the tappets adjustable. Altogether, the new 2½ h.p. J.A.P. is a thoroughly clean job, and highly suitable for light and mediumweight motor cycles.

As this engine is one of the few four-strokes under 300 c.c. capacity on the market at the present time, undoubtedly it will be in great demand from the many smaller makers who specialise in solo motor cycles. Already we have dealt with several such machines, the demand for which considerably exceeds the supply.

WOLF PEACE MODELS.

A New Lightweight fitted with a J.A.P. 2½ h.p. Engine and Countershaft Gear.

ALTHOUGH there is nothing strikingly new in the 1919 Wolf-Jap lightweight, it will interest our readers to know that the old-established Wolverhampton firm has decided to make such a model. The machine is fitted with the new J.A.P. lightweight engine, the 1919 improvements of which are described in some detail in the preceding article.

A two-speed countershaft gear, with clutch and kick starter, is fitted as standard, the gear being controlled by means of a gate change fitted underneath the tank, and the clutch by Bowden lever on the handle-bar.

The specification includes Lion variable magneto, Amac or Senspray carburetter, Druid forks, Lycett's pan-seat saddle, two toolbags with tool roll and full kit of tools, large aluminium footboards, Best and Lloyd drip feed pump, and 26x2½ in. tyres. The price is 56 guineas.

A 4 h.p. four-stroke and three Villiers-engined two-stroke models will also be marketed. The prices of the latter are £40 for single gear, £48 with two-speed,

and £50 with two-speed, kick starter, and clutch. The 4 h.p. J.A.P. - engined medium-weight with Sturmey-Archer countershaft gear is listed at £84.

The latest Wolf lightweight with a 2½ h.p. J.A.P. engine and two-speed countershaft gear

LETTERS TO

THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle" Hertford Street, Coventry and must be accompanied by the writer's name and address

GUDGEON PIN FIXING.

Sir,—Just a line to point out that the idea of the fixing of the gudgeon pin of the Vermorel car is not new. I have an old Minerva motor cycle with the gudgeon pin fixed in exactly the same manner. Also I should like to point out that the extraction of the locking-pin presents no difficulty whatever, and has given no trouble. R. WORSSELL.

WAYS AND COMMUNICATIONS BILL.

Sir,—Will you permit me the hospitality of your columns to explain to your readers the result of the debate in the House of Commons?

A large number of members were acting in co-operation with myself to protect the roads from the dead hand of the Railways; but the general feeling of the House was so strongly in favour of the Bill—at all events so far as it affected railways—that, after giving the fullest consideration to the matter, we felt that we could not divide against the second reading of the Bill.

I need hardly say that at a later stage of the Bill we shall move to omit roads from the powers of the new Minister with a view to constructive legislation for the development of roads and road transport being dealt with under a separate Board, and on this we shall most certainly divide the House, and I hope to receive support from those members—I believe the majority of the House—who, in their hearts, are opposed to this gigantic monopoly. W. JOYNSON-HICKS.

A CHALLENGE ACCEPTED.

Sir,—On passing through Wisbech, Cambridgeshire, on Wednesday afternoon, March 12th, I was interested to observe a challenge in the window of Mr. Bryan B. Ames; motor engineer, of Lynn Road, Wisbech, stating he was willing to match his 2½ h.p. Allon against any other make of two-stroke of the same h.p. for £100. I desire to accept his challenge, and would be glad to arrange a race from fifty to a hundred miles with my 2½ h.p. Ivy two-stroke of 224 c.c.

In the event of Mr. Ames agreeing to accept the challenge, could the race be arranged by your paper?

I am willing to go to Wisbech and run him there, provided he agrees to pay my expenses should I win. If he cares to come to Scotland, I agree to pay his expenses should he beat me.

I would also suggest that Mr. Ames correspond with you on the matter, as he seems to be so much buoyed up with the capabilities of his machine. However, I trust he will accept or withdraw the challenge. T. B. HILL.

A TABLOID HISTORY OF AIR-COOLING.

Sir,—Sergt. "G.C." does not seem to appreciate that low type of humour which is based on gross exaggeration, from which I deduce that he is Scottish rather than American. I beg to explain with apologies that I merely meant that special and rather wasteful measures are required to supply the cylinders of a rotary engine with a charge of mixture. If he desires to question this statement, as thus re-phrased, perhaps he will meditate on the peculiar construction of the Bloc tube carburetter and compare the relative consumptions of rotary, radial, V, and vertical engines of the same effective horse-power: he will find the rotary at the bottom of the list every time.

I never said that a 50 h.p. or 80 h.p. Gnome threw out two gallons of oil an hour.

I am well aware that some enthusiasts expect great things of various secret rotaries of novel construction, now that the conventional types are obsolete or obsolescent. I am

willing to be convinced: but I don't quite see how an engine which wastes 10% of its output in windage can be more efficient than one which reserves its power for the job in hand; nor how an engine which is subjected to centrifugal stresses can weigh less than a very similar engine which is devoid of such stresses. Perhaps I may have to eat my prophecy when I see some of these novel rotaries.

ROAD RIDER.

SPARE PARTS FOR OLD MODELS.

Sir,—I and, I think, others would like to know what the manufacturers, who are entirely discarding their previous designs, are going to do for the man who has listened to their previous blandishments and bought machines.

A.B.C. Motors are a glaring example of such unfeeling treatment, and yet they expect the buying public to rush for the revolutionary product of Mr. Bradshaw's brain. Although I have no doubt that the new creation will live up to the old A.B.C. reputation, it seems to me that the 1914-1915 model was all that could be desired. I speak from personal experience. Perhaps, next year, Mr. Bradshaw will have another "brain wave," and where will the purchasers of the 1919 model be then, "poor things," if the company concentrate on the latest model only?

I am aware that there are not many A.B.C.'s of the 1914-1915 model about, but those who have owned them, I am sure, are highly satisfied, and it is up to the makers to see that they may have replacements if wanted.

Some of these machines have been laid up during the war, their owners waiting for the time when they may be able to obtain that little spare they wanted, and now, after keeping up their spirits with, no doubt, quite truthful advertisements of the machine and engine, the makers suddenly "put the wind up" the long-suffering owner, by announcing an entirely new model altogether. J.

Newcastle-on-Tyne.

We submitted this letter to Mr. Granville Bradshaw, who replies as follows:

Sir,—Your correspondent is wrong in surmising (in the case of the A.B.C. motor cycle at any rate) that because we have taken full advantage of the knowledge gained by experience in this war, and redesigned our motor cycle, we have not made provision for keeping an adequate supply of spares and doing repairs to the pre-war A.B.C. machines.

What we have done is to place the manufacture of the new model in a factory excellently equipped and arranged for concentration upon this one model entirely, in order to give the highest service of the best article to the motor cycling public at the most reasonable price, and this has left us with considerable facilities for repairing and overhauling pre-war A.B.C. machines in our own shops.

We have a considerable number of pre-war machines being overhauled and tuned up at the present moment by our own skilled mechanics, and although we naturally cannot supply every spare from stock, we have quite a large number of spares, and are prepared to supply at short notice any part of which we do not happen to have a stock.

Your correspondent suggests that the 1914-15 model, from his own personal experience, was all that could be desired, and we are very pleased indeed to hear this; but, at the same time, we do not think that the motor cycling public should lose the benefit of later experience we have gained, particularly when this does not in any way affect the delivery of spares for our earlier models.

A.B.C. MOTORS, LTD.,

Granville Bradshaw, Engineer and Manager.

IS A CONTRACT BINDING?

Sir,—If your correspondent, "A Scrap of Paper," had consulted a solicitor, he would, I think, have advised him to bring an action for breach of contract. He has been bluffed out of his rights.
H.L.L.

HUB GEARS.

Sir,—Having read several articles and letters in *The Motor Cycle* derogatory to hub gears, I should like to say that I have found them to be absolutely satisfactory in every way. Having had three machines fitted with Sturmey-Archer hubs and all-belt drive, I never wish to have anything different. The only attention I found necessary was adjusting occasionally, oiling daily, and swilling out with paraffin at long intervals. None of the machines was used for "fair-weather" work only, but continually on bad roads and in all weathers. I made a clean ascent of the Wrekin in the winter of 1913-14 on a single-cylinder fitted with a three-speed hub without the slightest slipping or trouble with the gear.

I add the usual disclaimer.
Shrewsbury.

EX-D.R.

TO KEEP THE HANDS WARM.

Sir,—If your contributor Miss E. M. Gardener will wear under her mitts a pair of loosely knitted gloves, made of camel hair or natural alpaca, or a mixture of the two, brushed well outside and turned and worn inside out, she will find them to keep her hands as warm as she can reasonably expect. For technical reasons, it is usual to find it easier to achieve a really good "brush" on the right side of the glove than on the wrong side; hence the suggestion to turn it and wear wrong side out under the mitt.

Gloves such as I suggest have been made in Leicester in quantities recently, as the wools concerned have been "free of certificate," and in consequence have been very much used. The gloves should be kept very dry, as brushing holds the moisture.

Leicester.

COMFORT.

THE CONTROL OF AEROPLANE ENGINES.

Sir,—May I reply to a letter from Mr. R. A. Butt in *The Motor Cycle* published on February 20th? I should like Mr. Butt to be a little more concise and say to what engine he refers.

In his second paragraph he states that it is only in low-pressure gauges that he has ever noticed the pressure to be excessive. May I ask on what engine he has found this? He states that most engines have just the high-pressure gauge, and that it gradually builds up to its correct pressure. This, he will find, is in nearly every case exactly what it does not do. Why are overload gauges fitted, and also why do they fit gauges which read up to, in some cases, 400 lb. per sq. in., when the normal pressure eventually settles down to 40-60 lb. per sq. in., and in some cases less?

It is common knowledge that oil, when cold, is viscous. The majority of oil pumps fitted in aero engines are gear pumps, and very efficient, so that as soon as the engine starts up the pump delivers considerably more oil than the engine requires, hence the necessity of a relief valve. The relief valve and pipe leading back to either the sump or the tank cannot pass the excess of oil owing to its viscosity and skin friction, so consequently an excessive pressure is registered on the gauge. This happens on at least three well-known makes of stationary engines, not once, but every time, unless the oil is made very hot before being put in the tank, which is very often done.

I have both seen and heard of engines being stopped after perhaps seven minutes' running in order that the oil may warm up, but I admit there is not very much gained.

Mr. R. A. Butt cannot have had experience of machines built for long flights, which carry, say, twelve gallons of oil: as in the event of all this oil being in circulation, a rough estimate in cold weather is to allow from one and a half to two minutes for each gallon of oil in the tank to attain anywhere near its correct temperature.

I should be interested, if R.A.B. replies to this, if he would state what he considers the correct temperature C. for oil to be before getting off. I am fully aware that a number of pilots do consider that as soon as the water is warm it is good enough to get off. This is entirely wrong, and should be pondered over for a moment thus: what is happening inside the engine with the temperature low? The oil is being thrown about in—shall we say—lumps, instead of being sufficiently warm to form a spray.

R.A.B. states that almost every engine has its own set of revs. This to a point is true, but the revs vary very little indeed. The maker has to turn out an engine giving so much h.p., which is duly checked by officials, and there is very little variation in the h.p. on the brake tests; the variation may be more often due to the variation of the propellers.

R.A.B. states he has never heard of an engine being run up and down on each separate ignition system. May I take an engine with two plugs per cylinder, necessitating either two magnetos or one magneto and one battery ignition? If the engine is so fitted it is obviously with a purpose, which, let us say, is to make it more reliable, to say nothing of a little extra power. Unless the two systems are tried, for all R.A.B. may know he is only getting one spark doing any trade. If he is out for a long flight, surely he would rather have the satisfaction of knowing that if one plug goes out he has a chance with the other. Any good man who runs an engine will see that he gets very nearly the same number of revs on each ignition. Then why have two ignitions?

I must apologise for such a lengthy letter, but R.A.B.'s letter is one which could be picked entirely to pieces. May I respectfully suggest that he get facts and then write them?

And to be able to write facts one must have considerably more general experience than I gather from the tone of his letter he has.
DAN.

London.

Mr. Rex Mundy, the A.C.U. representative, now touring the country inspecting A.C.U. hotels. Mundy's mount is a Victory model Matchless.

D. H. Noble (late lieut. R.A.S.C., M.T.) is back again at the Rover motor cycle works in charge of the testing department. Noble was one of the Rover competition team.

HUN APPRECIATION OF BRITISH GOODS.

Sir,—On page 157 of your issue of the 13th inst. you give an instance of a despatch rider taking from a Boche aeroplane and fitting it to his own machine a plug which subsequently turned out to be of a well-known English make. We should like to say that the Boche's appreciation and adaptation of British fittings of aeroplanes were by no means confined to plugs, excellent as they are, for we had many instances during the progress of the war of bringing down and capturing German aeroplanes fitted with Palmer landing wheels and tyres. THE PALMER TYRE, LTD.

THE NEW A.B.C.

Sir,—On opening the paper on Thursday morning the first thing that attracted my attention was the illustration of the A.B.C. motor cycle, and I must confess I was a wee bit disappointed, as I, like many others, was looking forward to a much neater, more accessible, and simpler machine.

As "Ixion" remarks in the same week's issue, "Why cannot we have a 'power unit' without bolts, flanges, and rods projecting out here, there, and everywhere, besides all the awkward corners, making it absolutely a bugbear of a thing to keep clean?"

How Mr. Bradshaw intends the cylinders, rockers, tappets, valves, etc., to keep clean and cool I cannot imagine, unless he has designed a screen or something to keep the mud off and the air on. Which, in my experience, has been practically impossible.

You say that, though the tappets, etc., may appear to be on the light side, yet they are bushed. Surely this is to be expected on an up-to-date motor cycle, and I only hope that facilities are given for lubricating these small points in an efficient manner, otherwise they will soon wear and rattle.

I think the springing excellent, and a move in the right direction, owing to its simplicity and freedom from wearing shackle pins, etc. There does not seem to be any provision made to overcome the changing length (due to springing) between the chain wheel centres on account of the chain stays not pivoting on the centre of the driving sprocket.

You mention that the timing has a train of five wheels; also, there is a four-speed gear box and bevel and chain drive, all taking a percentage of power. This does not seem to me to be the most efficient way of utilising the power given off by the cylinders to propel the machine. The gear box may give direct drive to top speed, but not in the sense it does on other machines, as it really gives direct drive to the bevel only, then through the semi-protected chain to the back wheel.

I believe there has been, in another journal, some correspondence on the gyroscopic action of the flywheel. All I can say is, if Mr. Bradshaw will ride a four-cylinder F.N., geared six to one, at forty-five miles an hour, and try to lean over to take a curve on the road, he will find the machine refuse to lean, and if he cannot lean he cannot get round the curve, unless he slides round. I myself have experience of this.

In conclusion, I think Mr. Bradshaw is to be complimented on the unique and very clever design of the A.B.C., and I wish it success in spite of my criticism.

H. WALKER.

Sir,—I have read with great interest the accounts of the new A.B.C., and while the greater number of points please me very much, I should like to offer one or two suggestions for the improvement of the less important details.

(1.) Why should the front brake not be placed on the left of the wheel, thus allowing the speedometer drive its usual place on the right? (By the way, the present time seems opportune for the adoption of "Ixion's" oft-repeated suggestion that the drive should be screwed on to the hub and locked into place, instead of the troublesome method now used of attaching it to the spokes.)

(2.) The mudguards seem unduly narrow: valances close to the wheels are a great nuisance in snow and certain kinds of mud.

(3.) The splash guard is not high enough for winter riding; detachable pieces might easily be added.

(4.) An oil spray directed on to the chain is bad in practice, unless the chain is completely enclosed, because the oil forms with the road dust a very effective grinding paste,

which quickly wears both chain and sprockets. I have experienced this; a periodical soaking in a special chain lubricant is far better, and I should even prefer a dry chain.

(5.) Why not lubricate the fork links by drilling the steel pins and fitting a grease cap on the end of each?

I hope that Mr. Bradshaw will take these suggestions in the spirit in which they are offered, and make his machine as near perfection as possible. JOHN HOLLAND.

ALUMINIUM COOLING.

Sir,—In spite of the very modest and courteous letter of Mr. Ayton (March 6th), to whom, apparently, I have had the privilege of affording half-an-hour's amusement, I still adhere to my previous letter (February 13th).

I do not intend to enter into any further correspondence on this subject at the present moment, but in a few months' time Mr. Ayton may discover that the monopoly of intelligence is not confined to the charmed circle of his acquaintances. EDGAR RUSSELL.

THE HORSE-POWER OF MOTOR CYCLES.

Sir,—I notice that in *The Motor Cycle* for March 13th you suggest rating machines strictly according to capacity. You state that a motor cycle "in good tune" should give 1 h.p. for every 100 c.c. While admitting this, would it not be better to rate it as nearly as possible to what may be expected even in poor or average tune, which appears to be what the present manufacturer does? A nearer rating, to my mind, would be 1 h.p. for every 140 c.c.

Make.	Capacity. c.c.	Makers' rating. h.p.	Suggested rating. h.p.
Rudge ...	499 ...	3.5 ...	3.56
Triumph ...	550 ...	4.0 ...	3.95
Douglas ...	350 ...	2.75 ...	2.5
A.B.C. ...	398 ...	3.0 ...	2.84
Enfield ...	770 ...	5.6 ...	5.5
Indian ...	1,000 ...	7.9 ...	7.12

I think this should be sufficient proof that to allow 140 c.c. is preferable to allowing only 100. The public have got used to rating a 500 c.c. machine at 3½ h.p. and will expect that capacity for the power mentioned.

We all know that it is possible to get about 10 h.p. out of a 500 c.c. engine with special tuning. What the average purchaser wants to know is the power he may be certain of getting with his detuning. ROBERT B. BREEZE.

Sir,—We were highly interested to read your leading article on the above subject in *The Motor Cycle* of March 13th. This question of the h.p. of an engine is one which has "worried" us for some years, and in one of our catalogues we mention, in describing our engines, that we prefer to give, always, the cubic capacity, that riders could form their own opinion, by comparing, as to the h.p. We think it is highly desirable that some definite rule should be recognised by the trade. We style our single-cylinder engine, 499 c.c., as 3½ h.p.; the single-cylinder, 597 c.c., as 4½ h.p.; and the twin, 842 c.c., as 6 h.p.

We hope something may be decided as the outcome of your article, as soon we shall be printing a 1919 list, and we propose describing our twin engine, which will be 864 c.c., as 6.7 h.p.

It would, naturally, be a great advantage for the public if manufacturers could describe the h.p. of their engines on some acknowledged formula.

THE LLOYD MOTOR ENGINEERING CO., LTD.,

BOOKS FOR MOTOR CYCLISTS

MOTOR CYCLES AND HOW TO MANAGE THEM.

The recognised standard text book of the motor cycle; deals with all types of machines and with every part of the machine. 400 illustrations. Price 2/6 net. By post, 2/10.

HINTS AND TIPS FOR MOTOR CYCLISTS.

A valuable collection of useful "wrinkles" and items of information concerning the running, management, and repair of motor cycles. Price 2/- net. By post, 2/3.

TRACING TROUBLES.

Motor Cycle Faults, Their Identification, and Their Remedies Fully Explained. Price 2/- net. By post, 2/2.

Obtainable by post (remittance with order) from

ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4
or of leading Booksellers and Railway Bookstalls.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Preserving Plating.

? (1.) In order to make all bright parts on my motor cycle rust-proof I was thinking of giving them a thick coat of ordinary varnish, do you think this would be a success? (2.) Is 65 m.p.g. a good consumption for a 1917 $3\frac{1}{2}$ h.p., with passenger?—F.G.

(1.) There are several special varnishes and transparent enamels sold for this purpose, but they are somewhat difficult to apply. When applied the varnish is quite invisible, and it is impossible to see if all parts are properly covered. After the job has been completed and the article has been left to stand for a day or two, any parts not covered immediately tarnish and show up. After a little time the varnish is inclined to turn yellow, and the appearance is not good; while to remove the varnish by means of methylated spirit is a tedious and difficult matter. Oil and vaseline are also effective, but they collect the dust and are unpleasant to touch. (2.) This is not a very good consumption; on the other hand, it cannot be said to be excessive, considering the quality of present-day "spirit."

Irregular Firing.

? I am riding a 5-6 h.p. 1915 model Indian. The engine has been running beautifully up to a day or so ago. Whilst on a nice stretch of road I opened the engine up and then I throttled down for a corner, but when I attempted to open the throttle again it would only fire on one cylinder. If I retarded the spark it would fire on both. I took out the carbon brushes which were gummed up badly, and put new ones in, but this does not make any difference. The timing is all right, and if I put the plugs on the outside of the cylinders I get a good spark in both with the ignition fully advanced. Sometimes I may get them both to fire, but only three or four times in, say, two hundred yards. The carburetter is quite in order.—G.H.

Probably the trouble is due to a defective magneto contact breaker. Perhaps one of the cams is worn, or for some reason the contact breaker points are not making good contact. You should get someone to rotate the engine while you watch the behaviour of the contact breaker. It is also possible that the plug may be defective. Plugs which will spark on the exterior of the cylinder sometimes fail to spark under compression.

A Changed Tube.

? On March 3rd I left my cycle in a repairing shop for a new lever to be fitted. On the following Sunday, about eight miles from home the front inner tube burst suddenly, throwing me off. To save myself I had to let the cycle go, causing one pedal to snap off, and a little damage to myself. When I recovered, I pulled the tube out, and found that my own tube, which was practically new, had been exchanged for an old one, which caused the damage. Can I institute proceedings against the man for fraud, and claim damages?—WALES.

Judging from what you say, we are of opinion that you could institute either criminal or civil proceedings. From your point of view the latter would be better, as it would be more satisfactory to obtain damages than to get the man punished. We presume that you are in a position to prove your statements? If so we advise you to employ a local solicitor.

Magnets.

? Why are magneto magnets not made in compound form? That is, instead of each magnet being a single bar of steel, why is it not composed of, say, six thin strips of steel, separately magnetised and fixed together, making a much more powerful magnet than a single bar? Where can thin strips of tungsten steel be obtained?—A.J.W.

There is no reason why magnets for magnetos should not be made as you describe; it is a question of the manufacturing cost compared with the result achieved. The principle is carried out to some extent, as you are no doubt aware, in certain magnetos in which double or triple magnets are used to obtain extra magnetic strength. Presumably it is found that it does not pay to take the principle further than this, and, therefore, it is not adopted commercially. For thin strips of tungsten steel, write to Messrs. W. H. Jubb, Ltd., 12, Brittain Street, Sheffield.

A CHARMING GROUP OF POTENTIAL SIDECARISTS.

The fascination the motor cycle has for children is most marked. In this instance it is the children of Lord and Lady Decies who have taken possession of an Enfield outfit.

Difficult Starting.

Q

I have a 3 h.p. two-stroke Murphy. I have tried to start it on the road; I can push it along while I have the release open, but as soon as I drop it I cannot get the engine over compression. Please tell me what to do, as I am a novice.—W.J.H.

You do not say whether the machine is fitted with a fixed or variable ignition. If the latter, advance the spark about halfway when you are intending to start, or perhaps just beyond this point, inject petrol through the release valve, and push at a good speed, when the compression should be overcome without much difficulty.

A Two-stroke Query.

Q

Will you please oblige me by answering the following questions regarding two-stroke engines: In the downward stroke there is compression in the crank case, the carburetter being fixed to the transfer port. Is there a valve to stop the pressure getting to the carburetter? If so, where is this placed, and how does the engine get its gas; or, if not, how is it that there is not a blow back through the carburetter?—Sgt.-Obsr.

There is no blow back through the carburetter because the inlet port is closed. The carburetter is not fixed on the transfer port but on the other side. See the illustrations in "Motor Cycles and How to Manage Them," latest edition, pages 56 and 57.

Four-stroking

Q

I have a 2½ h.p. two-stroke motor bicycle three years old, and have never yet been able to get it to two-stroke under 20 m.p.h., and even then along the flat it will start four or eight-stroking up to 25 m.p.h. If I give it a bit of collar work it pulls well, but down the slightest incline the engine fires irregularly. I have altered the firing point from dead top to a lead of ¼ in., but find ¼ in. the best spot, although the makers actually recommend the spark to occur at the top of the stroke, but this position causes loss of power and just as bad four-stroking effects. The plug points have been tried at all gaps within reason. The compression is good, and there are no air leaks; in fact, I have tried everything I can think of without effect. I often wonder whether the port design is inferior, or whether a different two-stroke carburetter would be any use. The makers recommend a 28-29 jet, but anything above 27 causes more four-stroking. Nothing is sweeter than a two-stroke firing correctly, and the power and hanging on is fine, but eight-stroking on greasy roads and dark nights is miserable, as you know. I cannot get a good spark outside the cylinder by turning the magneto over by hand, but cannot think it is weak, as it fires so well and regularly on hills.—E.S.R.

The question of four-stroking is a difficult one. It occurs apparently in nearly all two-strokes under exactly the same conditions as those described in your letter. The exact cause is not apparent, and in most cases it appears to be incurable, but the fitting of a smaller jet than that

recommended by the makers after the machine has been in use for some time is often beneficial. We do not think for a moment that your magneto is weak, and the reason why you do not get a strong spark when rotating the engine is probably due to the fact that the magneto is not revolving fast enough.

Unequal Sparking.

Q

Will you please tell me the reason of and remedy for the following: I have an 8 h.p. Matchless combination fitted with a U.H. magneto. I have had the magneto down recently, and on trying to start up I found this: With the spark lever retarded I got a good spark on one cylinder and a weak one on the other; then if I advanced the lever fully I got a good spark where the weak one was and vice versa.—T.H.S.

The reason is that, owing to the cylinder angle, the spark occurs nearer the maximum position in one cylinder than in the other. As you advance the spark you change these positions over. As the speed of the engine increases when once it has started to fire you get an equally good spark in each cylinder, so the difficulty, which is inherent in the case of practically all old V type magnetos, only occurs at starting and at very slow speeds.

IMPORTANT NOTICE.

GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendation agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication.

ILIFFE & SONS LTD.

Difficult Starting.

Q

I possess a 1915 Royal Enfield motor cycle combination. I am wondering if you can give me a little advice as to starting the engine. The outfit is too heavy to push and jump on, and unless I can start with the handle the whole thing is practically useless to me. I have found the machine will start all right after being pushed down a hill a few yards, but it is only once in a while that the engine can be started with the handle. There are times when the handle will start the engine when it is hot, and occasionally when dead cold. I have done the usual in the way of flooding the carburetter, placing the magneto in all manner of positions, also injected petrol, but even then the handle fails to start the engine. Can you suggest anything I can do to rectify matters?—H.T.O.

Try injecting a little petrol, but not too much, and also try placing a rag in the fixed air inlet of the carburetter while turning the handle, removing this the instant the engine fires. Difficult starting is nearly always due to air leaks at the carburetter or induction pipe unions. Of course, war time petrol probably aggravates the trouble.

READER'S REPLY.

A Slipping Low Gear.

In your issue of March 6th there is a letter from a rider who cannot get up hills on the low Roc gear of his 3½ h.p. Humber. Devon is far from level, as many of your readers know, and I had similar trouble, until by leaning over I discovered that the low gear drum was slipping. It was evident to the eye that the drum and the rear wheel were not revolving together. It was also evident that I failed on hills, not for want of engine power or a sufficiently low gear, but because my engine power was wasted in useless friction. Should your querist desire proof, I suggest that he tackle a stiff hill, and at the top feel if the low gear drum is not distinctly warm. After making sure the frictional surfaces of the drum and band were in good order, I removed the lever at the end of the low gear band shaft, and replaced it with one twice as long. This proved an efficient remedy. The adjustment of these gears is rather a tricky matter, a little carelessness permitting the gear that is not in use to be a drag on the other. The point to be aimed at being to have both gears holding firmly and the back wheel to be free when neither is engaged.—W. H. TINNEY.

N.U.T. Appointment.

Mr. Geo. King, the well-known clubman, is now sales manager for the N.U.T. Co.

Lightweights in Russia.

It is, perhaps, not generally known that a large number of lightweight motor cycles were ordered by the Russian Government. Over 200 O.K. machines were sent out and, we understand, gave satisfactory service.

No Matchless Racing Machines.

Messrs. Collier and Sons, a correspondent was informed, are not making any machine for racing or record-breaking purposes this year. Their last aeroplane engine contract is completed, and the large department for the overhaul and repair of machines of their make is in full swing.

Ariel Officials at Suvla Bay.

Captain J. L. Stocks, R.A.F. (son of Mr. J. W. Stocks, general manager of Ariel Works, Ltd.), has just received his discharge and commenced his duties as travelling representative in the Midland counties for Ariel manufactures. He first joined the Armoured Car Division in 1914, and was present with his father at the Suvla Bay landing (Gallipoli), in August, 1915. He then joined the R.N.A.S., obtained his pilot certificate, was transferred to the R.A.F., and has been doing useful work on sea patrol. He gained his captaincy in July last year.

Catalogues Received.

A new B.S.A. catalogue is to hand, and, as usual, is very full of detailed descriptions of the well-known machine. The illustrations of the models are in colour. The catalogue is not dated.

"Royal Enfield Motor Cycles" (the Enfield Cycle Co., Ltd., Redditch): An extremely well got up catalogue, illustrated by tinted illustrations of the latest model Royal Enfields. The catalogue includes the 2½ h.p. two-stroke, the 3 h.p. twin with overhead valves and mechanical lubrication, and the well-known 6 h.p. and 8 h.p. sidecar combinations.

We are in receipt of Messrs. Jenks's latest list, which is quite an interesting publication. This describes tools of all kinds—adjustable spanners, box spanners, various types of pliers, set spanners, screwdrivers of no fewer than seven different kinds, oilcans, hammers, mallets, punches, tyre levers, and washers. All tools marketed by Messrs. Jenks Bros. are guaranteed to be of British manufacture.

We are in receipt of the magneto catalogue issued by the British Lighting and Ignition Co., Ltd., 204, Tottenham Court Road, London, W.C.2, makers of the B.L.I.C. magneto, and which is owned by Vickers, Ltd. The object of the catalogue is to furnish engine designers with a description of the company's latest magnetos, but in the future it is intended to issue separate pamphlets dealing in detail with each of the most important types. In the catalogue full instructions are given for those intending to order magnetos. A full range of motor cycle magnetos is listed.

SPARKLETS**The Endrick Co.**

Mr. H. S. Bilbe, A.M.I.A.E., who was one of the first we recruited for the Motor Machine Guns, has now been demobilised, and is restarting the Endrick Engineering Co., late of Olton, at Crawley, Sussex.

Stainless Steel.

An interesting booklet has been issued by the Firth-Brearley Stainless Steel Syndicate, Ltd., of Sheffield, which contains information and instructions to assist those who are interested in using stainless steel. The Firth-Brearley Syndicate is not a manufacturing company; the steel is obtainable from Thos. Firth and Sons, Ltd., Norfolk Works, Sheffield, and Brown Bayley's Steel Works, Sheffield.

Full Up.

Since the Armistice was signed and certain restrictions removed, a very large number of Triumph riders have availed themselves of the facilities offered by the Triumph Works for a general overhauling of their machines. As a consequence, they are now simply inundated with work in this direction, and, for the time being, are not in a position to accept any further motor cycles for general overhauling. The Triumph Co. naturally regret having to disappoint users, but riders will readily understand the many difficulties manufacturers have to face after being all out for so many years on war work.

War Service.

Messrs. Bowden Wire, Ltd., moved into their new factory in June, 1915, so as to cope with the demands of all the Allies for their goods. During the war the company were engaged in the manufacture of rifle grenades, fuses, etc., but the demand for Bowden wire became so great that the manufacture of this article gradually cut out that of other war specialities, and many million feet of Bowden wire have been consumed by Great Britain and her Allies.

N.S.W. (Australia) M.C.C.

THE inter-state trial organised by the N.S.W. Motor Cycle Club at Christmas, over the new overland route between Sydney and Melbourne, proved a great success. The results were as follow:

FIRST PRIZES (value £10 10s. each).

V. R. Blackett (3½ h.p. Zenith solo), no points lost.

A. Wright (7 h.p. Indian sc.), no points lost.

E. Tyler (7 h.p. Indian sc.), no points lost.

SECOND PRIZE (value £5 5s.).

L. Palmer (7 h.p. Indian), no points lost at controls; penalised through starting with sidecar and finishing solo.

THIRD PRIZES (value £3 3s. each).

II. Frost (7 h.p. Indian sc.), 60 points lost.

V. Flannagan (7 h.p. Harley sc.), 64 points lost.

FOURTH PRIZES (value £2 2s. each).

J. Treteway (6 h.p. J.A.P. sc.), 234 points lost.

E. Wiseman (7 h.p. Excelsior sc.), 393 points lost.

SPECIAL PRIZE (for machine finishing in best condition).

V. R. Blackett (3½ h.p. Zenith solo).

An animated scene at last week's well-attended meet of the Birmingham N.M.C.F.U. near Stonebridge.

LINES THAT EVERY MOTOR CYCLIST WANTS

**TIME, LABOUR,
 AND MONEY
 SAVERS.**

THE

“CHEMICO”

Specialities are obtainable from Garages, Motor and Cycle Dealers everywhere. The least difficulty in obtaining should, in the public interest, be reported to us.

“CHEMICO” CARBIDE

Packed, coated and cleansed as in pre-war days. The most reliable and the most economical. Your dealer can supply.

“COOLIE” MOTOR CYCLE OIL

No oil is too good for the good engine if the best results are wanted. If you use “Coolie” Oil those best results are ensured.

“CHEMICO” PATCHES

The most reliable patch in existence. Splendidly resilient, tenacious in grip and easily placed in position. Made from the best Para Rubber obtainable, beautifully moulded and finished.

These are but a few of our very many lines, why not send for copy of descriptive leaflet?

In answering this advertisement it is desirable to mention “The Motor Cycle.”

I ASK YOU TO READ THIS TESTIMONY.

COULD anything be more convincing. Mr. Edwards actually spends money to tell me how pleased he is, and Mr. Kendall spared his valuable time in writing me at length.

Mr. Fred Edwards, the well-known actor, after having a BINKS fitted to his Bradbury by Messrs. Chiltern, of Cambridge, wired me on reaching London this three word testimonial:

"GOD BLESS BINKS,"

the most unique testimonial ever given.

Mr. Kendall's testimony is more deliberate, and really important to you.

C. Binks, Esq., Eccles.

February 4th, 1918.

Dear Sir,—About two years ago I built, for my own use, a motor cycle composed of Chater Lea frame, A.J.S. pattern, 3-speed gears and kick-starter, and a 1913 7-9 Rex engine, which had had very little wear. The engine had, when I bought it, a carburetter which I tried on the machine when completed, and after tuning up, etc., only got 50 m.p.g. After that I was told to try a variable jet, which I did, and only got 25 m.p.g. after trying all positions of jet opening. A friend of mine who had a garage (in which, by the way, I built my motor cycle) lent me an and a, both of which gave me 50 m.p.g., and through all this I had set my mind on a Binks Carburetter, but my friend of the garage did not like them, and yet he had not tried them; however, I sent my first to Booth's, of Halifax, and got a Binks in exchange (so much to boot). I might say in passing, I have a Gloria sidecar. Myself weighing 14 stone and wife 15 stone, and a heavy machine, and the engine would not run below 18 m.p.h. on any of the carburetters.

The first run on the Binks with self and wife and boy 14 years, we did 70 miles, and we can now do (in summer) 108 m.p.g., and not only that, I have convinced my friend of the garage and others to such an extent that through my order about eight others have fitted BINKS, and are delighted with them, and I feel convinced that the Binks Carburetter is a mechanical job, and as a petrol saver it is the thing.

I have used all kinds of so-called spirit, and have not yet had a choked jet, but have taken out any amount of fluff from under the spring at bottom of filter.

The only improvement I can think of is a better washer on cap under jet orifice, and a grub screw to keep air slide from dropping off, which it has done with me about four times, and slightly less control covers and discs to same.

A. the time of building the machine I was residing in Hull.

Yours truly (Signed), W. H. KENDALL.

"THE SAME AS YOU CAN BUY"

THIS phrase—"The Same as You Can Buy"—was first linked with "Precision" Engines in 1912, when their users were winning hill climbs and other efficiency contests with unfailing regularity. It was intended to convey that the engines supplied to the public were of the same high calibre as those which were achieving these successes.

In 1915, when our resources were requisitioned for other purposes, the production of "Precision" Engines was suspended, and the phrase dropped from our announcements. It can now be resumed. Delivery dates can be given for two 1919 "Precision" Models—

- (1) An 8 h.p. twin-cyl. engine following the general lines of the 1915 model, but with improved and silent valve gear, a simple but very efficient valve-lifting mechanism, and roller bearing big end to connecting rod.
- (2) A 3½ h.p. single-cylinder engine of 350 c.c. capacity on the two-stroke principle possessing many unique merits, including roller bearings to connecting rod big-end and main bearings, and an automatic and continuous lubricating system. It is believed that this model will earn a reputation as high as the famous series of "Precision" Singles.

INVALUABLE WHEN OVERHAULING.

THIS handy little volume deals with all the faults to which motor cycles are liable, explains how they can be easily diagnosed, and shows how they can be rectified. Every conceivable cause of trouble is dealt with, and the remedy for it carefully explained.

THE present edition has been brought up to date by the author, all obsolete matter taken out and new material added. The Section dealing with Two-stroke Motor Cycles has been considerably enlarged and rearranged. A new Section dealing with Electric Lighting Dynamos has been added.

H. Wheeler & Co., Bombay, Allahabad, and Calcutta.**SOUTH AFRICA**—Central News Agency, Ltd.**PARIS**—Smith's English Library, 24 Rue Rivoli.**The Spring of 1919.**

NOT since 1914 has spring brought with it so much promise of activity in the motor cycle world. After the repression of years of war, enthusiasm for the pastime seems likely to burst forth with renewed vigour. Spring this year means more than it has ever done; it will be a reunion of many motor cyclists who have lost touch with each other since 1914, and who have been scattered all over the world in the service of the nation. Moreover, every meeting of motor cyclists has an unusual interest this year, when so much novelty is expected in the new models. Truly, the winter of war is past and the voice of the hooter heard once more in the land.

Single-cylinder Balance.

HITHERTO it has been recognised as a fact—albeit a lamentable one—that the single-cylinder engine could not by any convenient means be balanced perfectly.

In the balancing of a motor cycle engine, we have to consider two separate sets of weights: the reciprocating parts and the revolving parts—not to mention such minor matters as the angularity of the connecting rod and the formation of a couple. It has long been known that a revolving weight can be balanced suitably by another revolving weight, hence it is easy to balance the crank pin, big end, and that part of the connecting rod, which is for convenience taken to be a revolving weight, by a weight, or weights, placed on the crankshaft or flywheels. Similarly, reciprocating masses can be simply and effectively balanced by other reciprocating masses acting in an opposite direction. This accounts for the almost perfect balance of a flat twin, even when no balance weights are added, for one piston balances the other, and so with regard to big end and connecting rod. There will, however, still remain an unbalanced couple unless means are taken to prevent this by placing

the cylinders truly in line, and using a double or forked connecting rod in one cylinder and a three-throw crankshaft. But the improvement in results hardly repays the added complication, when it is remembered that, given a suitable crankshaft and narrow big end bearings, such as can be used when roller bearings are employed, the cylinders can be placed a very little out of line.

In the case of a single-cylinder or V twin, the problem of the couple does not occur, and the primary balance has been the difficulty. Take, for example, a vertical single-cylindered engine. If the balance weights are made equal to the unbalanced revolving masses, the big end and crank pin will be adequately balanced, but the reciprocating parts will be entirely unbalanced, and much vertical vibration will take place. If the balance weights are made equal to the sum of the revolving and reciprocating parts to be balanced, the vertical vibration is largely removed—it cannot be entirely eliminated on account of the angularity of the connecting rod—but a considerable horizontal vibration will be set up. From the rider's point of view, this is less important, but it is customary to adopt a compromise, and make the balance weights equal to the revolving masses and half the reciprocating masses. This results in only a very moderate degree of balance.

We are now in a position to state, on the authority of a well-known automobile engineer, that a device has been invented by which a single-cylindered engine may be really well balanced. We are not at the moment permitted to reveal the method by which such a desirable end is achieved, but it is quite simple, and said to be entirely effective. Moreover, the names of those responsible for the device are a sufficient guarantee that it will do all that is claimed for it. It will be readily understood what this means to the single-cylinder, for it will result in its chief handicap, when compared with the flat twin, being removed.

SIR HENRY NORMAN AND HIS AUTO-PED.

Interview with Sir Henry and Major Low, who have designed an Improved "Motor Scooter."

Sir Henry Norman on the motor scooter, which received a great deal of publicity in the daily press quite recently.

As mentioned in the article "The Motor Scooter" appearing in last week's issue, the great interest taken in the motor scooter by the British public is largely due to Sir Henry Norman and Rear-Admiral Sir Reginald Hall.

Major Sir Henry Norman, Bart., F.R.G.S., A.I.E.E., M.P., is an old patron of motor-ing, is a member of the R.A.C. Committee, and of the Legislation Committee of the R.A.C. He is keenly interested in scientific subjects, and among the numerous important posts he has held was that of Liaison Officer of the Ministry of Munitions with the Ministry of Inventions in Paris—a most interesting appointment which brought him in touch with the numerous ingenious devices brought out by our French Allies. He has also

taken a lively interest in science and electricity generally and wireless in particular, and the first time we found his name connected with the motor cycle was when he had an Allon two-stroke fitted up by the High Tension Company as the source of power for producing current for a wireless installation during his investigations at the Front.

There is no doubt that Sir Henry is extremely enthusiastic over his motor scooter, and we are confident that an account of his views on this method of locomotion cannot fail to interest our readers. We therefore approached Sir Henry, and he readily accorded us an interview at his house in Westminster.

"How did you become acquainted with the Auto-ped, Sir Henry?" we asked.

"Lady Norman saw it in an American paper, and said, 'That is the very thing I have longed for all my life,'" replied Sir Henry.

"Did it take her long to get one?"

"Well, about six months, and when I had finally obtained it Lady Norman rode it in the first five minutes down the Portsmouth Road."

Here we may mention that the Hon. Lady Norman, C.B.E., has done magnificent work during the war, and at

the present moment is chairman of the Women's Committee of the Imperial War Museum.

"Does Lady Norman find it useful in her work?" we asked.

"Yes," replied Sir Henry. "She has given up the car altogether, and uses the scooter exclusively for getting about Town in connection with her work."

"What do you think of it as a mechanical contrivance?" was our next question.

"I think it is a very useful little vehicle," replied Sir Henry. "I may tell you that she has been bombarded by enquirers who addressed her in the street. So far as its mechanical design is

concerned, I called in my friend, Major Low, and together we took it to pieces, and found it to be hopelessly inaccessible and poorly made. I am confident, however, that a motor scooter, properly designed, has a big future, and I may tell you that Major Low and I have taken out several patents, and in a few weeks' time hope to have a sound design on the road."

Here we took leave of our genial host, who before

we departed showed us the Auto-ped's garage, a small coat cupboard near the front door, and had a few minutes' conversation on the subject of motor scooters with Major Low, whose name, of course, is well known to our readers. When asked his opinion on the standing question, Major Low replied: "Why stand? If you stand on a motor scooter you have complete control of it, and an absolutely perfect balance. If you sit down it is not nearly so easy to maintain the balance. Bearing in mind that the motor scooter is only used for short distances, I do not think the standing attitude is at all an objection. Mind you, the present design of motor scooter is hopelessly crude, and the particular pattern that Sir Henry Norman and I are bringing out will be a great improvement."

Major Low, R.A.F., the well-known scientist, who expresses his opinion of motor scooters on this page.

Sir Henry Norman, Bart., M.P., and Major Low, R.A.F., who are collaborating in the production of a motor scooter.

A Logical Decision.

FROM one standpoint it is rather a pity that the A.C.U. has disowned the four-wheeled cycle car.

Should such a vehicle ever make good, it will wage war on sidecar outfits and other three-wheelers, for if a firm in command of the requisite brains and capital ever takes up the cheap featherweight four-wheeler, it could certainly be turned out at a price which would cut the ground from under all existing four-wheelers. Even in 1914 the Baby Peugeot—an expensive design turned out in smallish quantities—was cheaper than many sidecar outfits. So the ideal would certainly have been for the four-wheeled cycle car to remain under the *ægis* of the A.C.U. But this ideal was shattered by the impossibility of drawing a line between the cycle car and the light car, just as the pundits have already failed to distinguish the light car from the car proper. The decision is mournful, but inevitable.

Wanted, Progress in Handle-bar Control.

Nobody seems to have noticed that handle-bar control is practically stagnant. We are still using the apparatus which was invented a dozen years ago, and which admittedly serves its original purposes fairly well, though it looks untidy and collects rust. During the last year or two we have seen the birth of automatic carburettors with a throttle lever arc of six inches or so, and gear changes which demand no more muscular exertion than a throttle opening. The former are controlled by levers which compel the rider to take his hand off the bar, thereby reducing the handle-bar control to much the same level of inefficiency as the old tank levers. The latter is operated by a side lever, subject to a similar defect. In many gear changes the location of the gear lever is of no particular importance, but a handle-bar change would be very pleasant, especially for the clumsier riders, under three sets of conditions, viz.: (1.) At speed. (2.) Over rough going of any kind. (3.) In thick traffic. It may perhaps be added that we are still waiting for a really sound handle-bar clutch control. All that can be said in favour of the best patterns is that they possess plenty of leverage. The span of the grip is always too wide to be comfortable, and if a hold-out trigger is fitted, it seldom remains reliable for long.

About Noise.

IT is rather absurd of some agitators to desire to silence motor cycles in the interests of the general public. We admittedly create a good deal of noise on occasions, but our machines are much less of a public nuisance than trains, trams, tubes, motor lorries, and motor 'buses. I have stayed at six separate hotels in London during the last year, and at none of them was it possible to sleep until one's body had grown accustomed to the uproar—incessant or intermittent—created by various forms of cheap public

transport. At my house in the suburbs low-flying aeroplanes awakened the household soon after sunrise on every calm, clear morning. The man who selects motor cycling noises as a high spot in the list of public grievances has no sense of fact or proportion. If making England "fit for heroes to live in" is to include the abolition of all noises, including suppressing the postman's knock, the milkman's yodel, setts and cobblestones, and performing a surgical operation on cats, motor cycles must plainly be silenced: but they play a very insignificant part in the noisy noise which accompanies our daily life.

Manufacturers and Silencers.

TO say that our machines are noisy because the average manufacturer is a poor engineer strikes me as ridiculous. I rode an almost perfectly silenced motor bicycle as long ago as 1904, and the public would not have it at any price. Personally I found it quite appreciably dangerous. A motor bicycle is too small to catch the tail of a pedestrian's eye: if we go in for efficient silencers, we shall be driven in our own and everybody else's interests to fit raucous alarms and to operate them incessantly—the remedy may be worse than the disease. There may be something—but not so very much—in the contention of *The Times* correspondent that riders like the open exhaust because the only alternative is valve clatter. But I am sure he is wrong in considering that the elimination of mechanical noises would create a yearning for a silencer with a note like the hiss of a snake, or even reconcile the average rider to such a silencer. For some wholly mysterious and possibly criminal reason, most of us like engine noise for its own sake, quite irrespective of the protection it affords or of the extra power it might offer as compared with a badly designed silencer. I fancy the reason is that noise is suggestive of power and also of the more sporting nuances of motor cycling—Brooklands, the T.T., etc.; but, whatever may be the reason, the fact remains.

The Debacle of the N.S.U.

CAN any Colonial reader tell me how and why the N.S.U. machines lost their supremacy in our Colonial markets? A few years ago every letter to hand from the Dominions lauded the N.S.U. machines, and derided the lop-eared way in which British makers competed with the Hun, just as to-day we hear panegyrics of the Indian, Harley-Davidson, etc., and frantic enquiries as to whether our own firms will ever wake up. I never much liked the N.S.U. machines myself: they looked tinny, and they lacked refinement; but they were undoubtedly reliable, and they were fitted with reliable two-speed gears long before the average British machine had thought about such a thing. Then quite suddenly they lost their Colonial popularity, and presently the Yanks came along and filled the breach.

THE MOTOR CYCLE

AS AN AID TO "OTHER PASTIMES"

WHAT boundless possibilities are opened up by the use of a motor cycle as an aid to one's favourite pastime! There is hardly a known form of recreation the enjoyment of which cannot be facilitated by its use. Shooting, fishing, golf, tennis, football, photography and sketching, to name only a few—the motor cycle has a place in each.

Of course, the motor cycle can be the means of transit to and from anything, be it a cricket match or a wedding, a boxing tournament or a "jazz" ball. It is with those pastimes into which the motor cycle enters with a more intimate relationship that I propose to deal. Touring may be called a pastime, and the motor cycle is *par excellence* the tourist's mount, but this form of recreation forms such a well-known part of motor cycling life that a passing reference is all sufficient.

Shooting.

It is in the pursuit of game that a motor cycle can assist to perhaps a greater degree than in any other sport.

A misty morning in early October and a day's shooting in prospect, the venue being a group of small covets lying in a secluded valley about ten

How the Motor Cycle scores over both the Motor Car and Pedal Cycle.

miles away. A couple of sidecar outfits, and stored away in them a luncheon basket with the guns and munitions thereof: even the dogs can be squeezed in along with the "guns," and if the sport does not prove good—well—it is, load up and away to other fields. Without a motor cycle it would mean a wasted day and a return home to

drown the disappointment in—ginger ale.

Angling.

This offers much the same good use for a machine. Many an owner who is lucky enough to have time to fish can tell of the advantage gained by an early arrival, and, indeed, a late stay at his favourite water.

(Left) The motor cycle can be brought close to the river's edge, thus saving the carrying of tackle and food from the inn.

(Right) At most tennis courts and cricket clubs the motor cycle is in evidence.

The delight of lounging after dusk at some trout lay whilst the last orange glow of the sunset is making a mystic glitter on the placid surface and a chorus of murmurs emanates from the adjoining rushes where

A simple method of carrying a tennis racket.

some moorhens are squabbling over domestic matters; a quiet smoke and discussion of piscatorial doings of the day, and of other days; and then an easy return journey to civilisation, form a delightful alternative to the hurried scramble, *sans* motor cycle, to the nearest railway station.

Following hounds may form an interesting occupation for a lazy day, the "following" being confined to anticipating the course and getting up with the hunters at various points of road crossings. With a bit of luck, one may even be "in at the death," but it is as well to remember that Masters of Hounds do not like promiscuous following by outsiders.

Lawn tennis, cricket, and all other kinds of field games come into a class in which the motor cycle forms a quick transport to the scene of operation, and the only points of interest arising are (1) the carrying of racquet, cricket bat and pads, etc., when riding solo, and (2) the question of efficient mudguarding and a clean working engine when riding in flannels. The first can be solved by a type of clip on the fork, of which there are several on the market; but a full cricket bag forms an awkward proposition for the solo rider by reason of its unusual length. The second point is one that may be solved by efficient leg shields, and many riders make use of their machines whilst garbed in "whites" without noticeable detriment.

Golf.

More often than not the golf course is several miles out of town, and some mechanical conveyance is absolutely necessary. It is in conjunction with this pastime that the motor

cycle is more freely used than with any other. At a golf club house on a fine day, one can see a dozen or two motors; sidecars and solo machines being always well represented. The carrying of clubs will generally be found easiest slung over the shoulder, but a little ingenuity will devise a method of strapping a kit on to the forks.

In those countries which are blessed with a reliable type of winter and where the ice comes to stay, not to vanish when the word "skating" is breathed, the motor cycle takes quite a prominent place in winter sports, not only in getting to and from the ice,

but no inconsiderable amount of amusement is derived by running a machine on the ice as a sort of tug-boat for the towing of strings of skaters.

There are some pastimes which do not come under the category of games or sport, but are usually termed "hobbies." These include photography, sketching, and the study of natural history. I believe the motor cycle has been used in connection with the last-named to carry impedimenta to places difficult of access.

Sketching.

The motor cyclist who is fond of sketching and even the professional artist find motor cycles of remarkable assistance both in getting to the desired spot and in forming an easel and seat. A route card holder or map holder fixed on the handle bar will easily support a sketch block, and the rider can remain in the saddle, provided he can wheel his machine into the desired position. This dispenses with the conventional easel and camp stool.

These are the principal forms of pastime in which the motor cycle plays such an important part, and no other form of vehicle can give such "efficient" service.

F.S.

(Bottom) Usually the golf course is a few miles from home, and the economical running of the motor cycle scores greatly over the lightest of light cars.

Motor Assisted Bicycles

WHAT THEY CAN DO AND THEIR LIMITATIONS.

WHETHER the auxiliary motor will ever attain the vogue in England that it has in America it is very hard to prophesy. Nevertheless, it is an undoubted fact that there are many here to whom the motor attachment would appeal. Several such auxiliary motor sets have been offered to the British public, and at least three firms are shortly introducing improved models at a low price which promise to fulfil every requirement. The elderly cyclist shuns any suggestion of complication; the lady cyclist must be convinced of reliability, and other potential purchasers want to know wherein lie the advantages for particular purposes, over bicycles and motor cycles.

Motor-assisted bicycles to some extent overlap the field of both the lightweight motor cycle proper and the pedal cycle, and yet have a distinct scope of their own. For town hack work they should be an ideal form of locomotion, and do all that the lightweight motor cycle can do, hence they should appeal to doctors, nurses, messengers, and business men. The golfing enthusiast and the angler also would find a machine of this type useful. It should require a minimum of attention in the way of adjustment and cleaning, and be capable of going anywhere a pedal bicycle will go, and as those we have seen are light enough to be lifted over stiles, the artist in search of rural scenery could have no better form of transport for himself and his pocket-carried impedimenta. The nature lover and the potterer, too, should find it an equal boon. It must be admitted, however, that

these advantages are in many cases obtainable with lightweight motor cycles. On one point the motor-assisted bicycle should make a strong appeal, and that is the fact that riding such a machine demands no extravagant or heavy clothing. On the latter score alone it should find favour with many.

Then there is the ardent cyclist. Through the agency of this attachment he can greatly increase his radius, save much of the heart-breaking and perspiring uphill work, and yet get his normal amount of exercise as well. This, of course, provided his pedalling gear ratio is sufficiently high; in which connection it would be advisable to have a three-speed hub fitted.

Then lastly there is the ever-present question of price. To the man who already has a bicycle it will cost him the value of another machine.

Social Possibilities.

One aspect of these mounts which is often overlooked is their inherent social possibilities. The main

The motorised cycle makes appeal to ladies on account of its light weight.

The motor-assisted bicycle is useful to sportsmen in general who desire the conveniences of power coupled with the cleanliness of the pedal cycle.

difference in motor cycle and bicycle club runs is that the motor cyclists are strung over many miles, while the cyclists generally ride in a bunch, and do not need sidecars to provide a conversational companion. The attachment of the motor does not eliminate this advantage. For the person who lives in some town in an industrial area, a trip into the country by bicycle would often entail considerable time lost in traversing uninteresting

B.S.A.

Motor Bicycles

Economy.

One reason for the great economy of B.S.A. Motor Bicycles is the extreme efficiency of the B.S.A. Countershaft Three-speed Gear. This well-known device renders hill-climbing with a sidecar and passenger easy and sure. Business riders, tourists, naval and military men, all testify to the satisfaction which B.S.A. Motor Bicycles are giving, and, whether you require a machine for commercial or pleasure purposes, you, too, will appreciate B.S.A. reliability and efficient service.

*For
Solo
and
Sidecar*

Workmanship.

The more closely B.S.A. Motor Bicycles are scrutinized and tested the more is one impressed by the excellence of B.S.A. workmanship. Every part testifies to the thoroughness of B.S.A. methods. For many years the public has appreciated the value of B.S.A. workmanship, the constant growth of this popularity being fostered by concentrating on B.S.A. Motor Bicycles the most scientific processes known to modern engineering.

Motor Assisted Bicycles.—

residential parts, so that the speeding up effect of one of these small machines would save that time and enable longer periods to be spent in rural surroundings.

These, then, are a few of the pleasures and advantages to be gained by the possession of an auxiliary method of propulsion in addition to the bicycle.

Limitations.

When we advance into the range of the lightweight motor cycle proper, we have quite a distinct and separate set of requirements in which the motor-assisted cycle cannot hope to compete with it. The great distinction between these two types of machine lies in the word "auxiliary." The motor cycle is a motor and just sufficient cycle—the reverse is the case with the cycle-motor, where the motor part is distinctly subservient to the bicycle. Here, then, is the limit mark of the motor attachment. It has no serious luggage-carrying capacity. Compared with a motor cycle proper, it is unpleasant to ride for long distances, or for touring over bad roads in bad weather. On the other hand, it is better than a pedal cycle in these respects. A good speed average, compared with the lightweight, is impossible, but again, a higher average can be maintained than by pedal power alone. The motorised bicycle, however, is not intended for high speeds nor for more touring than would be done on a pedal cycle. Its aim is to save fatigue more than to save time. On account of the small tyres and rigid frame, vibration at higher speeds than those at which the pedal cycle is run is objectionable, and also deleterious to the machine. To pedal the machine with-

out the engine assistance, owing to its added weight and the stouter tyres usually fitted, may be said to be somewhat tiring. Its apparent trustworthiness and reliability render it liable to be neglected, and woe to the unfortunate cyclist who finds himself miles from anywhere with a lifeless motor. Again, the elderly rider, inclined to *cynicism*, does not find so small an engine of much use on really steep hills, and pushing it up a hill is a searching test for weak hearts and short-windedness.

Summing Up.

From the various *pros* and *cons*, it will be seen that there is a distinct sphere of usefulness for the bicycle with an auxiliary engine. It will, however, not appeal to those who have been fully fledged motor cyclists, although they may recognise it as a fertile source of recruits to their favourite sport. It does not appeal to the speed man, the solo or family tourist. It should have a public of its own, and these will in all probability be culled from the ranks of the bicycling fraternity, and not from those of motor cyclists. To the latter there is a suggestion of the ridiculous in being perched on a high saddle with a frenziedly revolving engine, bowling along at 20 m.p.h. or less, or pedalling uphill to keep up the revs. It reminds one too much of the old days of l.p.a.

This is the age of wheels, and soon everyone will want some handy quick means of locomotion, not as a passing craze, but as an example of the ever-growing need of industrial, commercial, and social efficiency, and there is a class of rider for every type.

MASCOT.

The proposed new road over Styhead Pass will pass through some of the wildest mountain scenery in England. The new road is shown by the dotted white line the old road being a continuous white line

RECORDS—FROM THE INSIDE.

By VETERAN.

A GREAT change has come over the motor cycle industry during the last few years. When first I knew it, and indeed for many a long year afterwards, there was hardly a theoretical engineer engaged in it. The few engineers we boasted were of the practical craftsman type. They were incapable of designing an engine, but they knew how to make one if somebody else provided the drawings; and on occasion they knew how to fake one, too. So in the earliest days if a firm or an individual contemplated a record-making or record-breaking stunt in the interests of profit or glory, the position was that we had a Continental engine—French, Dutch, or Belgian—Minerva, Kelecom, or Peugeot; and we had to make it do something which the standard patterns could not do, or find some freak man with an indiarubber skin and nerves of steel wire who would dare or stick something calculated to appal any other rider.

There were at this period four main stunt avenues, each of which demanded quite different treatment. You could circle round a small track with semi-flat banking a mile faster than anybody else dare do it. You could try to win a hill-climb. You could essay fame in a reliability trial: these were usually run in penny numbers of 100 miles on successive Saturday afternoons till all the riders bar one had broken down, unlimited tuning up being allowed during the week. Finally you could attempt a long-distance record, e.g., from Land's End to John-o'-

Groat's, which then occupied about three days. The track records at Canning Town, the Crystal Palace, and on the flat grass tracks used for cycle sports were terrific affairs, with Harry Martin, the brothers Chase, and the Colliers kings at the game. Personal recklessness was everything here. Half a dozen of these boys would take machines capable of 50 m.p.h. to a suburban sports meeting in a cricket field, and scrap round a small circle of wet turf marked out by wooden posts and ropes. Tuning had little to do with it. It was simply a question of which man was willing to take most risks. On the gently banked cinder tracks tuning was of some account, but was amateurish, compared to the wiles of a G. E. Stanley. You handled so many engines per year in your job as an assembler of motor cycles. Occasionally you hit a spot engine, on to which you froze. You got all the moving parts nice and lissom; you got all the compression joints dead tight. You tuned up the make and break contacts, and you faked the carburetter. Then you crouched low, and risked your neck at every corner. The early hill-climbs would not raise a thrill nowadays, though we thought them wildly exciting, and the annual Catford C. C. climb at Westerham was so sensational that it verged on the sinful and unhealthy. All the men I have named would be there, with R. M. Brice on his Brown, A. E. Lowe or

(Top) Harry Martin (Martin-Jap), Class A1, under 275 c.c., flying km., flying mile and hour records. (Centre) Left to right, N. D. Slatter (Alcyon), Class A, under 250 c.c., one hour; H. C. Newman (Ivy-Precision), who put up sidecar records in 1913; C. R. Collier (Matchless), Class E, under 1,000 c.c., flying mile. (Bottom) F. W. Barnes (Zenith), Class I, under 1,000 c.c., with sidecar, flying mile; T. B. Haddock (A.J.S.), Class F, under 350 c.c., with sidecar, one hour; E. B. Ware (Zenith), Class I, under 1,000 c.c., with sidecar, one hour; G. E. Stanley (Singer), Classes C (500 c.c.) and D (750 c.c.), one hour. (See table on page 354.)

one of the earliest J.A.P. engines, and a few others now lost to fame. Tuning implied little more than I have indicated above, except that numerous secret visits were paid to the hill beforehand with a motor car full of spare pulleys, and the most suitable gear was thus selected. The start was from a standstill, but you were allowed a hefty pal to heave you off, and much depended on whether the engine fired promptly, and whether you could fly into the saddle without wasting a tenth of a second. Behind the scenes most of the makers were ransacking the Continent for new and better engines, and it was not an unknown thing for a man to unearth a new engine somewhere in the Low Countries, bring it to England with deadly secrecy, and make a new crank case to camouflage it, so that no rival should buy a duplicate. One year when two or three of the cognoscenti thought they had got something rather hot, Joe van Hooydonk turned up with more than his usual smile: he had got hold of the first $3\frac{1}{2}$ h.p. m.o.i.v. Minerva, which soon killed off the a.o.i.v. $2\frac{3}{4}$ h.p. brigade. About this time some really good British engines began to appear. The Motor Manufacturing Co. produced a good copy of the $2\frac{3}{4}$ h.p. De Dion, and the Excelsior people put it in a rather weak and top heavy frame, on which Sam Wright and others were all but invincible. The curious Humber chain-drivers, with their engines in the P. and M. position, piloted by Johnny Crundall and Bert Yates, also took a lot of holding, and the British industry began to stand on its own legs. Every now and then I encounter a decrepit sample of one of these pioneer makes offered for £5 or so at a junkshop. I always beg a ride, and marvel that I could have enjoyed my tours on them as I unquestionably did. Yet one always looks back and recalls those old days with pleasure and zest. Not less do I wonder how these single-gear'd mounts carried us all over the map.

Our reliability trials were a literal scream. Redbourne was a favourite venue for the M.C.C. solo trials, and Godstone for the passenger events with primitive sidecars and tricars. The first stop outed you. You toddled steadily twenty-five miles up the road and twenty-five miles back, turning in the width of it until you had done your 100 for the day. If you survived, the performance began again the next Saturday. Leonard Jones, with a miraculous $1\frac{3}{4}$ h.p. tricycle, and Milligan with a 2 h.p. Bradbury, nearly drove the committee crazy. I believe that one summer the pair kept going for about three months.

The End-to-end.

The End-to-end was, of course, too formidable an affair to be taken in hand lightly. To begin with, nobody knew the road, and the rider had to be provided with typewritten route instructions, culled from C.T.C. road books and the like, whilst guides were sought for on the more populous sections. Then steam ferries had to be chartered across the Firth of Forth and at Beaulieu—nobody dreamt of riding round in those days, and the brief rest was welcome to a man who was spending three sleepless days in the saddle of a single-gear'd machine of two cat-power or thereabouts. Hotels had to be warned all along the road, especially for the night hours. It was all very well fixing a zero hour, and wiring the time of your start all down

Class A (under 250 c.c.), flying km., record holder W. A. Jacobs (Singer). Class C (under 500 c.c. with sidecar), C. G. Pullin (Rudge).

the route, but there was never any reason in theory why you should not do the 880 odd miles in two days, and you plotted your schedule accordingly. But it must be admitted that there were often frequent doubts and misgivings. As a rule, the aspirant took two days to get half-way, so his manager had to be perpetually wiring revised schedules to all the hotels, guides, garages, etc. (I know I once scheduled my first 110 miles for three hours, and my manager almost fainted

Records from the Inside.—

when I rode in dead on time.) Then you had to engage your timekeeper—one of the big cycle racing men like Urry or Bidlake. He had to train down to Land's End to start you, and then up to John-o'-Groat's to see you finish. As a rule, you did not finish; but you wired him you would be up by train in a day or two, as soon as a new pulley or piston or crank case had come to hand, and would he please wait and start you off again in a fresh attempt from the reverse direction. All this cost pots of money. Still, many men and many firms had a go at it. Tom Silver set up an astounding record with a single-gear Quadrant in some sixty-four odd hours, an average speed of about 12 m.p.h. including all stops. To sit such a machine practically continuously for the best of three days was some feat. Even in daylight, when the engine was running well and clear vision made a rush possible, I don't suppose it could have climbed such hills as Shap and Berriedale. At night rushes were impossible, because lamps were bad and the rider never knew when a hill was coming: so incessant "l.p.a." would be the order of the day. Belts, of course, gave continuous trouble. Valves and piston rings wore down at an amazing pace: even cams could not always be trusted, and the ignition contact breaker required fairly frequent adjustment. The highland section of the route was in very bad order, the strip from Struan to Kingussie being more or less overgrown and unrepaired. There were giants in the land in those days, and Tom Silver was one of them.

End-to-end in 48 Hours.

Then G. P. Mills put a two-speeder at the course, and cut the time down to forty-eight hours. His Raleigh machine had two separate chains from the countershaft to the rear, and he coupled up either of them by means of dog clutches in the hub. He struck terrible weather on the northern half of the run, but profited by familiarity with the roads owing to his numerous pedal cycle records.

Trade jealousies are probably responsible for the yarns that some of the record-breakers used up whole relays of machines. Such libels were bound to spread when no official body could supervise the ride, because the speed limit—12 m.p.h. in Silver's day, and later 20 m.p.h.—was exceeded.

I shall always remember how I once happened to be sleeping at an hotel bordering a southern patch of the course, when about 2 a.m. I heard a bevy of motor bicycles tear past "hell for leather." I guessed what it was, and, tumbling out of bed, slipped overalls on top of my pyjamas and ripped after them. I never caught them, and the attempt on record failed. Rumour was that this particular aspirant had about six companions to escort him along bits of the road which he did not know too well—one to lead him, and the rest behind in case of accidents. On this occasion I believe the leader took a sharp corner rather too daringly, and the whole crowd, including the record-breaker, piled up in a heap on top of him.

There are many interesting bits of secret history anent a later chapter of records, *i.e.*, those associated with Brooklands. But few of them are known to more than the handful of people most intimately concerned. One or two of them prove that even at a comparatively late date pukka engineers were not at the bidding of

all our motor cycle firms. Certain proprietary engines, much used by assemblers, had acquired such a vogue that the manufacturers began asking stiff prices for them, which cut into the assemblers' profits. So the assemblers conceived the idea of making their own engines, and so saving the middleman's profits. Two such firms asked friends of mine to design engines for them at a price. In each case the assembler had devised an engine which would do for his touring mount, but it was no good for speed stunts. My friends were both engineering students, so to speak, and quite incapable of planning real hot-stuff engines: but they did their best. One of them "designed" an engine for the hour record, which when thoroughly tuned lapped Brooklands at about forty, to his great dudgeon; but he got his fee all right, because he accidentally discovered it would climb any hill at forty, if suitably geared, and the firm got a lot of kudos with it, though they never dared to use it for anything else. The other special hot-stuff engine was a complete washout; and both firms ultimately returned to their first love.

Camouflaging the Secret.

Meanwhile, Rudge, Douglas, Triumph, Norton, Singer, and J.A.P. were steadily cutting down all the standard figures, and immense activity was displayed in contouring cams and valve passages. The great thing was to camouflage your real secret. If you hit on some little gadget which lent another mile an hour to your engine, you pretended it was really something else, and when you put your machine away, you furtively removed the magneto contact breaker or the valve cams. Some rival was sure to spot this harmless action, draw wholly false deductions, and waste tons of steel and many hours in experiments which probably led nowhere at the finish.

One bright lad completely flummoxed a very famous designer. He bought one of the designer's standard T.T. machines, did something to it, and then challenged the designer to a private test. The designer's machine got the worst of it in a brief sprint: not by a big margin, but by enough to matter in an hour record. The designer finally paid over good money for the secret, and was mortified to discover that the inventor had merely raised the compression.

The Speeds of the Future.

Before long this old game will reopen, and as we have now got plenty of real engineers in the motor cycle game, and air-cooling has got so far since 1914, we shall see some astounding stunts. There is no reason why the short flying start records should not be fought out with four valves per cylinder and compression ratios as high as $6\frac{1}{2}$ to 1. The cooling will stand it nowadays, and patent fuels, embodying benzole, do not object to super-compression. I know one engine which makes standard aero plugs wilt like tallow candles in a New York summer, and I fancy there will be plenty of fun. But I am sorry for the boys who have to sit these mile-eaters. A flying mile or kilometre is not so bad, though the tiniest hesitation or unsteadiness at 80 or 90 m.p.h. means immediate death. But the idea of an hour record on two-wheelers at such speeds as are now technically possible is frightful on the very best of tracks; and I am not at all sure that the B.M.C.R.C. ought to allow long distance motor cycle records at such speeds.

ALL-BRITISH MAGNETOS

M-L Type K1, for standard single-cylinder motor cycle engines, $3\frac{1}{2}$ to 6 h.p.

A 2,000 Sparks-per-second Test

The parts of an "M-L" Magneto are tested to a very high voltage—20,000 volts for the moulded insulation and 15,000 for the armature. In the latter case the test is made at a frequency corresponding to 2,000 sparks per second—about twenty times the maximum rate which can ever be called for in service. Quality tells.

The M-L Magneto Synd., Ltd., Coventry

The Right
Sidecar Machine
The New 3 h.p.

IS A
Perfect Chaperon
VERY UNOBTRUSIVE, WANTS
LITTLE OR NO ATTENTION,
BUT LOOKS AFTER TWO
PEOPLE VERY THOROUGHLY

It is meant for sidecar work, but it gets its strength from the lightest and most specialised materials, and its power from scientific engine design. Its function is to transport people with the maximum of comfort and efficiency—there is no prodigality of useless metal to pull the speed down and add to wear and tear.

The little engine and its four-speed gear box are not to be daunted by any hill—they have aeroplane traditions to uphold. They know all about **SPEED** and **CLIMB**.

And the wonderful suspension makes the saddle as luxurious as the Sidecar.

VERY WELL WORTH WAITING FOR!

RUNABOUTS AND CYCLE CARS.

THE cycle car proposition is again in the melting-pot. Whether it will emerge as a vehicle mechanically sound and as efficient as the two types it is supposed to bridge (the sidecar and the car) has yet to be proved, for, excepting the Morgan, the several machines which are promised for this year are new designs, untried, so far as the public is concerned, and in many cases untried also by their sponsors.

Whether present-day designers of these little vehicles will profit by the failures of their predecessors remains to be seen. From the advance specifications of some of the proposed machines, one gathers that there are quite a number of venturesome spirits ready to risk their all in machines which embody features having little to recommend them. On the other hand, several well-known firms have in hand runabout propositions embodying nothing which is not tried and proved practice.

It may be an open question which policy will most help the development of the runabout; but, while the future of the type is in the balance, the soundest policy appears to be one which plays for safety rather than to exploit individual ideas of doubtful value.

Wanted—the Next Stage to a Sidecar.

It seems tolerably certain that the miniature car type of vehicle will not have a place in the cycle car field for some time to come. Manufacturing costs prohibit a vehicle embodying such things as four-cylinder water-cooled engines, shaft transmission, and differential axles, from being produced at a price which will allow it reasonably to be classed as a cycle car—a type of vehicle which essentially is nearer to the sidecar than to the car in the matter of price.

On this point it is difficult at the moment to state an approximate price at which a cycle car should be

Notes on Small Three and Four-wheelers—Past, Present, and Future.

The De Luxe model Morgan—a make that has for many years successfully demonstrated the possibilities of the three-wheeled runabout.

sold. The average sidecar outfit costs about £110. The average light car figure will be perhaps £250. Therefore, it is perhaps permissible to quote £150 as a fair price which can be asked by makers of cycle cars. If this is so, then probably there may be several new vehicles which will come into the class with engines in the neighbourhood of 1,000 c.c. and of very light weight.

On the other hand, it is questionable whether £150 is not too high a figure for the class of buyer who is considering the purchase of a cycle car, for it must not be overlooked that a vast proportion of potential buyers of such vehicles are those who are quite satisfied with a sidecar except for the absence of protection for the driver. It must follow, of course, that if there is a great demand for motor vehicles at £300 and at £150, there will be a field for another at £200; but the cycle car proper is a proposition interesting motor cyclists, and when the price reaches £200, it appeals more strongly to the buyer of a car, with which type of vehicle it comes into competition. At the moment, the solution of the cycle car problem may be looked for in a first-class three-wheeler—four wheelers promise to be too expensive this year.

Pre-war Types.

Pre-war cycle cars were of many types, and included the following:

- (1.) Three-wheelers with the engine at the rear of the seats and driving the single rear wheel by means of a chain or chains.
- (2.) Three-wheelers with single wheel at the rear and the engine at the front.
- (3.) Three-wheelers with the single wheel at the front.
- (4.) Four-wheelers with the engine at the rear driving live axle by chain.
- (5.) Four-wheelers with chain or shaft transmission to countershaft, final drive by belts.
- (6.) Four-wheelers with all chain transmissions.
- (7.) Four-wheelers with friction transmission and final drive by shaft.
- (8.) Four-wheelers with friction transmission and final drive by chain.

The Premier Super runabout, which is now on the road in an advanced experimental stage.

Runabouts and Cycle Cars.—

The L. S. D., a Huddersfield production, having an air-cooled V twin engine and shaft-cum-chain transmission.

(9.) Four-wheelers with shaft transmission and with twin engines.

(10.) Miniature cars, as the Singer.

The first-mentioned type, although reliable, was not fast, and the most successful machine in this group—the A.C. Sociable—has been abandoned. It is not expected that any machines of this type will be introduced.

Undoubtedly the success of the Morgan has been responsible to a large extent for the revival of the cycle car, and several machines in the second group will be marketed shortly.

The third type finds no supporters now, but the fourth (the Carden type) will be revived.

Type 5, with final drive by two belts, appears to have been abandoned altogether, which is significant, considering that this was the most general form of transmission on cycle cars of 1911 and 1912. The G.N. in future will be chain-driven, and the Buckingham will be an orthodox light car. The last Adamson to be built had shaft transmission, while there is no news of the Victor.

All-chain driven cycle cars are conspicuous by their absence in post-war programmes, excepting where the engine is placed at the rear and drive direct to the axle.

Type 7 is no longer represented by the well-known G.W.K. cycle car, which has been abandoned in favour of a larger car accommodating four persons. Another maker, however, will introduce a small car embodying the same system of transmission.

All the pre-war vehicles in Type 8 have been abandoned, and the companies concerned no longer exist. Undeterred, however, by these failures, at least three other makers are taking their place.

Type 9, so far as transmission is concerned, will be represented by three well-known firms, but probably the vehicles will be very different propositions from the Humberette and Swift, the most successful little cars

The 1919 G.N., a four-wheeler built on true cycle car lines.

in this group which have been abandoned in favour of larger vehicles.

The tenth and last type—the miniature car—has been developed in many cases until with a larger engine and longer chassis it is a "large" car of the lighter type. The miniature car is no longer a cycle car—only the Singer remains of the original group with engines under 1,100 c.c., and even this small car cannot be said to conform to the old cycle car definition on the point of weight.

In addition to the ten types mentioned, there was the vehicle built on sidecar lines and fitted with a two-seated body. At least two such machines will be in evidence this year.

The Post-war Types.

The following is a list of runabouts and cycle cars now being produced or promised for this year.

Name.	Type.	Transmission.
A.B.C.	4-wheeler, a.-c. flat twin engine.	.. Shaft.
A.C. Bantam ...	4-wheeler, w.-c. flat twin engine.	.. Shaft.
A.V.	4-wheeler, a.-c. V engine at rear.	.. Chain.
Carden	4-wheeler, a.-c. V engine at rear.	.. Chain.
Cosmos	4-wheeler, a.-c. 3-cyl. radial engine.	.. Shaft.
Eudrick	3-wheeler.	.. Shaft.
G.N.	4-wheeler, a.-c. V engine, 90°.	.. Shaft and 4 chains.
H.F.G.	4-wheeler, a.-c. flat twin engine.	.. Friction and shaft.
L.S.D.	3-wheeler, a.-c. V engine.	.. Shaft and chain.
M.B.	3-wheeler, V engine.	.. Friction and chain.
Milton	4-wheeler, 2-cyl. 2-stroke engine.	.. Friction and chain.
Morgan	3-wheeler, a.-c. or w.-c. V engine.	.. Shaft and 2 chains.
Palladium	4-wheeler, a.-c. flat twin engine.	.. Friction and chain.
Premier	3-wheeler, w.-c. V engine.	.. Shaft and chain.
Scott Sociable ...	3-wheeler, w.-c. 2-cyl. 2-stroke.	.. Shaft.
Wooler	3-wheeler, a.-c. flat twin engine.	.. Belt and shaft.

Excepting the Morgan, all the cycle cars promised for 1919 are new designs. Even the G.N. is altered

The Wooler Mule, a three-speed flat twin-engined runabout to be marketed by the maker of the Wooler motor cycles.

to such a degree that it may be regarded as a new proposition—and consequently has to prove its efficiency. True, many of its features have been proved efficient in the older model, but the final transmission employing four chains is new so far as the public is concerned.

The Scott Sociable has been undergoing tests for several years, and Mr. Alfred A. Scott is not likely to place it on the market until he is satisfied that everything is right, but here, again, the public has not yet had an opportunity of trying the machine, and to all

TRIUMPH

IS a Trade Mark but—it's also a symbol!

To every man who rode a TRIUMPH in the War it suggests reliability—comfort and security. He thinks of episodes—blinding along “all out” to get through in time—bumping and bouncing over broken roads—“soloing” through the mud and grease, and then—he realises what the dependability of the TRUSTY TRIUMPH meant to him! Realises what a mechanical failure would have resulted in!

NOW—he's going to ensure that his Peace mount will be a TRIUMPH, by going to his nearest Agent right away.

The moral being—well, can you think of a better machine?

Members of the

The 'Standard' Model.

Specification and Prices of the G.N. Standard and Vitesse.

ENGINE.—The engine is the 90° air-cooled twin, which has been fitted to the G.N. since 1912.

The G.N. engine is vibrationless, the running balance is superior to the balance of an ordinary four-cylinder engine.

Its two cylinders, 8½ x 9½, give a capacity of 1098 c.c., and the G.N. system of air-cooling, with deep cooling fins and arrangement of inlet and exhaust valves, gives excellent results. The engine is placed across the frame, and the cylinder heads and exhaust ports are very thoroughly cooled by the full and direct air draught.

A large external flywheel is fitted and gives very steady running and slow pulling.

The rockers operating the overhead inlet valves are entirely enclosed

in a neat casing, cast integral with the dome.

The cylinder heads are easily detachable, and their extreme accessibility enables carbon deposit to be removed in a few minutes.

The Vitesse model has a specially tuned engine with overhead valves and lightened reciprocating parts, it is capable of high speeds and is practically a racing edition of the Standard engine.

On both models the engine is mounted in the frame by a system of three-point suspension.

LUBRICATION.—G.N. system of semi-automatic pump, delivering direct to crankshaft bearings, air-cooled sump to crank case.

TRANSMISSION.—Through 3-plate G.N. clutch to bevel-driven cross-

shaft, thence by Renold roller chain to rear axle. Drive is taken through only one chain at once, and all changes are made by substantial hardened steel dog-clutches. The transmission is simpler even than on the past Grand Prix models.

SPRINGS.—G.N. semi-cantilever springs with radius rods.

STEERING.—A neat steering gear box is fitted with bevel-gearing.

WHEELS.—G.N. detachable and interchangeable wire wheels, 650 x 65, with spare wheel and bracket.

WHEELBASE.—Standard 8ft., Vitesse 8ft. 6in., track 3ft. 6in., overall length 10ft. 3in., width 4ft. 2in., height 3ft. 4in., with screen 4ft. 1in. Ground clearance 9in. Weight, Standard, 6½ cwt.; Vitesse, 5½ cwt.

The STANDARD MODEL. With detachable interchangeable wheels, but not equipped with accessories - - - £140

Fully equipped with hood, screen, dynamo lighting set with head lamp, side and tail lamps, spare detachable wheel with tyre, horn, pump, tool kit, jack, and number plates - - - - - £167 10

The VITESSE MODEL. With detachable interchangeable wheels, but not equipped with accessories - - - £170

Fully equipped with celluloid screen, dynamo lighting set with head lamp, side and tail lamps, spare detachable wheel with tyre, horn, pump, tool kit, jack, and number plates - - - - - £195

FURTHER PARTICULARS, WITH FULL SPECIFICATION, TERMS, ETC., WILL BE GLADLY POSTED ON APPLICATION.

G.N. LIMITED,
ETNA WORKS,

ALBERT ROAD,
HENDON, N.W.4

Raymond.

Two 1919 four-wheeled cycle cars. (Left) The A.V., which closely follows the line of the pre-war Carden. (Right) The 1919 Carden, having enclosed engine at the rear.

The A.V. is practically an improved Carden, while the 1919 Carden is a new design, embodying many new features. The Wooler three-wheeler is to have a primary drive by three belts over variable pulleys, and a final transmission by shaft and worm.

There are several other three-wheelers, including the Endrick, of which very little is known at the present time. The M.B., a friction and chain-driven vehicle, and the L.S.D. with shaft and chain transmission, are both products of Northern firms. Then there is the new Premier runabout, which appears to be all that is claimed for it. Unlike the majority of the new cycle cars, this vehicle is on the road.

The Palladium and H.F.G. employ friction and chain and friction and shaft respectively, while the A.C. Bantam, A.B.C., and the Cosmos will have more or less conventional car transmission by shaft.

Perhaps the most interesting engine of the new vehicles is that which will be fitted in the Cosmos cycle cars. This will follow aero engine practice very closely, having three cylinders arranged radially. Of the other engines, two are water-cooled two-stroke twins—the Scott and the Milton. The G.N. has a 90° air-cooled twin, and the Premier, Morgan, A.V., Carden, M.B., and L.S.D. are fitted with V twins. No fewer than five of the sixteen vehicles mentioned will have flat twins. These are the A.B.C., the A.C. Bantam, Wooler, Palladium, and H.F.G.

From the above it will be seen that, taken generally, the post-war runabout and cycle car are new propositions, and, while a limited number may be sold during this summer, they appear to be 1920 models rather than belonging to this year's output.

VEDETTE.

The famous Dunchurch "avenue" in its present desolation. The fine elms, after much controversy, have at last fallen to the axe of the woodman. The outfit is a 5-6 h.p. twin Rover.

THE magnificent avenue of elms on the Dunchurch Road, near Coventry, has long been threatened.

But now the threat has been carried into effect, one passes along this famous stretch of the Telford highway with, one might almost say, sentimental distress. What was one of the most glorious avenues in the Midlands is now a desolate waste. No doubt there were good reasons for its destruction, one of which was the inner decay of many of these noted

elms, this constituting a big danger to passers-by. The outfit on which we visited the scene was a 5-6 h.p. Rover, driven by Mr. Ravenhill, the works manager of the Rover Co., and, although not a proper road test, the impression obtained was decidedly favourable. Smoothness, silence, and power are three attributes that purchasers of high-powered outfits will look for in the future, and these points were particularly noticeable in the Rover outfit.

CURRENT

Times to Light Lamps.

SUMMER TIME.

April 3rd	...	8.3	p.m.
" 5th	...	8.6	"
" 7th	...	8.9	"
" 9th	...	8.13	"

The Strength of the A.C.U.

Counting the members of affiliated clubs, the total strength of the A.C.U. is now 30,000.

A Rumour.

A rumour is abroad that the Moto-socoché firm, the manufacturers of the famous M.A.G. engines, intend to start a factory in this country. The M.A.G. engine is a fine production, and its admirers will be pleased to learn that in the near future it will be British instead of Swiss made.

Petrol Profiteering.

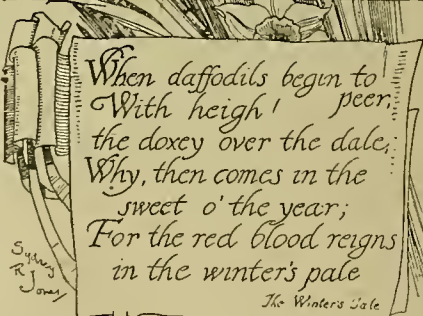

The Home Office has circularised the police authorities throughout the country asking them to do their best to see that the vendors of petrol comply with the requirements of the Petrol Retail Prices Order. Those of our readers who are overcharged should communicate with their local police.

The Proposed Sty Head Pass Road.

It is, we are informed, extremely likely that the proposal to construct a road between Wasdale Head and Borrowdale will be decided at the next meeting of the Cumberland County Council. A correspondent who talked the matter over with an influential member of the Council informs us that there will probably be a strong majority in favour of making the road at once.

London-Edinburgh Run.

Every endeavour is being made by the M.C.C. to hold the London-Edinburgh run this year, which will probably take place in June, competitors starting on the evening of the 6th and arriving in Edinburgh on the evening of the following day. It has been suggested that the London-Edinburgh this year will be a more or less "go as you please" competition. Entrants to qualify for a gold medal must complete the journey in twenty-two and a quarter hours, twenty-four hours for a silver, and thirty hours for a bronze medal. Arrangements for meals en route will be made by the club if possible, otherwise each competitor will have to look after himself, owing to the present difficulties in catering. There will be no secret checks, but competitors will be timed at certain points to see that they do not exceed the speed limit, and any competitor who is a quarter of an hour ahead or behind schedule will be disqualified. This year there will be no return journey. The hon. sec. (Mr. Southcomb May, 15, Endsleigh Gardens, London, N.W.1) will be glad to hear from members and others who will volunteer to help.

Taxes.

Speaking at the A.C.U. meeting in Birmingham, Mr. E. S. Shrapnell-Smith mentioned that the pre-war 6d. per gallon on petrol for private cars and 3d. for commercial vehicles yielded £4,000,000 revenue, and that a further million was derived from the annual licences, making a total of £5,000,000.

It has been stated that the Government intend to spend twenty millions on the roads. Before the war fifteen millions were spent annually, but sometimes "road improvements" included pavements, lighting, water, electricity, etc. Of this sum motorists contributed about 10%; if the supertax remains they will be contributing nearly 50% of the total cost.

CHAT

Special Features.

ANNUAL SPRING NUMBER.

Special Articles and
Photographs.

Police!

Henley-in-Arden (Warwickshire) police were busy examining driving licences during the past week-end.

Scottish Oil Mine Closed Down.

The Addiewell oil mine, Linlithgowshire, one of the pioneer shale oil mines in Scotland, has been closed down indefinitely owing to labour troubles.

A Bargain.

In a list of "bargain" advertisements the following quaint description appeared last week in the *Evening News*: "Seven-nine twin Brown engine, 8 horse Sturmev Archer 3 speed hub, heavy frame and sidacar, what offer."

Mr. Alfred Bednell Resigns.

Mr. Alfred Bednell, O.B.E., has resigned his appointment as general manager of the Cycle and Motor Cycle Manufacturers' and Traders' Union, but until his successor is appointed he will continue to be in charge.

Fuel for a Quarter Million Miles.

Mr. S. Henshaw, vice-president of the National Benzole Association, recently told a meeting of motor cyclists that he was prepared to accept orders for railway tanks of benzole. These have a capacity of 2,500 gallons, or sufficient for a quarter of a million miles with a 3½ h.p. machine.

An Auto-wheel Case.

Recently, at Mortlake Police Court, a reader of *The Motor Cycle* was summoned for using a "motor car" with a motor cycle licence. The summons was issued by the Surrey County Council, who averred that his hand-propelled tri-cycle, to which an Auto-wheel was attached, was a motor car, and therefore required a full motor car local taxation licence. The Surrey County Council was also supported by the local taxation licence authorities. Our reader (who is a cripple) defended the case himself, and it was unanimously dismissed by the bench of magistrates.

A New Relief Road.

The suggestion that a relief road should be made on the London-Brighton highway between Thornton Heath and Purley is now in a fair way of being carried out. Already the Croydon Borough Council are proceeding with its construction. The average width of the carriage drive, which will commence at Thornton Heath Pool, cross Waddon Marsh to the left of the National Aircraft Salvage Depot and the Wallington Aerodrome, and join the main road at Purley, is about sixty feet. It will be constructed of dustless materials, and have the foot-ways bordered with trees, the estimated cost being £148,237.

T. T. WINNER, 1914.

Rudge Multi

START!

ANTICIPATION.

By Appointment
Cycle Makers to
H.M. KING GEORGE

The start of the Senior Tourist Trophy Race caused anticipation of victory to many riders—particularly to Mr. C. G. Pullin, who pinned his faith entirely to his Rudge-Multi.

His Multi gear enabled him to keep his machine at the top of its power, no matter what the gradient of the road.

His Rudge - Multi aided him thus to—

FINISH!

REALISATION—VICTORY.

Rudge-Multi, the machine which won the Senior Tourist Trophy Race, Isle of Man, May 21st, 1914. The average speed was 49 m.p.h.

Now the War is over, and we can again divert our energies to the manufacture of Rudge-Multis.

Competitions Abroad This Year.

The Swiss have decided to organise several motor cycle trials, and the Italian club, the Motor Cycle Club of Turin, intends to organise the famous Mont Cenis hill-climb, which consists of a fourteen-mile run, uphill all the way, and includes, so the announcement states, the terrible hairpin corners on La Scala. These terrible hairpins are not so terrifying after all, as they are not so bad as the Devil's Elbow or the hairpin bends in the Isle of Man. The severity of the trial is not in its gradients, but in its length, which imposes a very severe strain on an air-cooled engine. Such a test is not possible in the British Isles, and we should imagine that it would be well worth while for the English manufacturers to consider the advisability of entering for this event.

The *Gazetta dello Sport* is organising a reliability trial from Milan to Naples (a distance of approximately five hundred miles) in May, while the Motor Cycle Club of Turin is organising a reliability trial, including a hill-climb over the Col de Sestriere.

Rejuvenated Ancients.

Spring is bringing out a remarkable collection of antiquities. On main roads in the Midlands machines of other days were to be seen taking the air. A Quadrant of approximately 1905 date was undergoing drastic ministrations to its interior, having failed to drag a sixteenth century sidecar up a 1 in 100 gradient. Strangest sight of all was a James of the "forks on one side only" variety going fairly well. Our hopes of seeing a Singer front wheel driven tri-cycle were disappointed.

No French Trials This Year.

The Automobile Club of France, which holds a somewhat similar position to the Motor Cycle Union of France as the R.A.C. to the A.C.U., has, we understand, publicly stated that there will be no French motor cycle trials this year, in view of the difficulties with which the French manufacturers find they have to contend, as regards materials and delivery.

It is pointed out, however, that there is nothing to prevent private individuals organising competitions among themselves, and those who may care to enter such competitions should look through the fixture lists of the Swiss and Italian clubs.

Fuel Union Rally.

A national "Victory" intermeet of the National Motor Cyclists' Fuel Union will take place on April 20th at Stratford-on-Avon. The organisers think that this "intermeet" will probably be the largest gathering of private-owner motor cyclists ever witnessed in this country.

We are advised that contingents of the N.M.C.F.U. from Portsmouth, Weymouth, Glasgow, Newcastle-on-Tyne, Sheffield, Manchester, Birmingham, Bristol, Coventry, Wolverhampton, Bedford, Nottingham, Leeds, Leicester, Lincoln, London, Derby, Liverpool, Barrow-in-Furness, Grantham, Rugby, and Ashby-de-la-Zouch are now completing arrangements for their run and attendance.

PURCHASING SECOND-HAND MOTOR CYCLES.

At this period of the year many used motor cycles change hands. Our readers are advised to exercise every care in purchasing second-hand machines, and to deal only with firms of high reputation, or, in the case of private advertisers unknown to them, to insist upon dealing through our Deposit System, which is designed to protect their interests, unless the machine can be tested before purchase. Dates of manufacture should be verified, when possible, by taking the engine and frame numbers and sending these to the makers. No firm or person whose methods are proved to be unsatisfactory is permitted to advertise in "The Motor Cycle."

Sidecars for Taxi Service.

There is a dearth of taxicabs in Paris, and, as a remedy, the French capital is to have a public service of sidecars. Probably the machines used by the American Army will be acquired and equipped with adjustable hoods for the protection of the passengers. The charges are to be 7½d. for the first kilometre (almost five-eighths of a mile) with 3d. a kilometre afterwards.

The National Benzole Co., Ltd.

We stated several weeks ago that a benzole distribution company was likely to be formed. This has now come about, the company (which has registered offices at 5, Gray's Inn Square, London, W.C.1) being capitalised at £300,000. All of this amount has been subscribed among the members of the National Benzole Association. It will be a pleasure to know that in the future the distribution of benzole will be greatly facilitated, and it will be as easily obtainable as petrol throughout the country.

At the Junior Car Club's rally at Burford Bridge last Saturday. Two New Zealand motor cyclists on 2½ h.p. "Maoris."

Nottingham and District M.C.C.

The opening run will take place on April 6th to Belvoir Castle. The start will be from the Market Place, Nottingham, at 2 p.m.

Wakefield and District M.C.C.

An opening run to Bolton Woods has been arranged for April 6th. Honorary secretary, Mr. H. E. Wood, White Horse Hotel, Westgate, Wakefield.

Oldham and District M.C.

The opening run of this club will be held on May 4th, when the members will go to Macclesfield and Jenkins Chapel. Honorary secretary, Mr. H. Wright, 134, Manchester Street, Oldham.

The Hall M.C.

The Hall M.C., started in connection with the Dartford Ironworks, of which membership is confined to members or employees of the firm of J. and E. Hall, Ltd., has at present about forty members. The opening run was to Wrotham and Sevenoaks on Saturday, March 29th. It is proposed to hold a paperchase in the near future. The club has been affiliated to the A.C.U.

Glasgow M.C.C.

At a meeting held in the Athenæum, Glasgow, it was decided to recommend the committee to promote competitions, and to endeavour to develop the social side of club life. Mr. John Gow was re-elected president, and the vice-presidents are Messrs. G. W. Orr, G. H. Cutbush, and J. S. Fulton. The new captain is Mr. W. Hood; vice-captain, Mr. G. Wilson; honorary secretary, Sgt. A. C. McMin.

Woolwich, Plumstead, and District M.C.

The fifty-mile non-stop trial on April 6th will start from the "Three Horse Shoes," Knockholt, Kent, at 10.30 a.m. Entrance fee should be sent to the hon. sec. before the day of the trial. The course will be down Star Hill to Dunton Green, along the main Hastings Road, through Sevenoaks to Lamberhurst. Hon. sec., F. J. Ellis, 3, Nightingale Place, Woolwich, S.E.18.

Bolton and District M.C.

The first three events of the season are purely social, beginning with a run on April 6th at 1.30 p.m. to Higher Hodder. On May 4th the first competitive event will be run off, in the shape of the ever-popular reliability trial, details of which, route, etc., will be announced later.

Any motorist or motor cyclist resident in Bolton and district who would like to take part in the social runs is invited.

Intending members should leave their names and subscriptions (5s. 6d.) with the hon. secretary, Mr. Jas. E. Whitaker, 205, St. George's Road, Bolton.

Future Events.

April 5.—Birmingham M.C.C. Opening Run to Stratford-on-Avon.

April 5.—Coventry and Warwickshire M.C. Opening Run.

April 5.—Cumberland County M.C.C. Special Meeting, Crown and Mitre Hotel, Carlisle, at 6.30 p.m.

April 5.—Essex Motor Club. Victory Dinner at Frascati's, Oxford St., W.

April 6.—Bolton and District M.C. Opening Run to Higher Hodder.

April 6.—Eastern Counties M.C. Opening Run to Harlow.

April 6.—The M.C.C. Opening Run to Hatfield.

April 6.—N.M.C.F.U., Coventry. Run to Badby Woods.

April 6.—Nottingham and District M.C.C. Opening Run to Belvoir Castle.

April 6.—Woolwich, Plumstead, and District M.C. Non-stop Trial from Knockholt to Lamberhurst and Back.

April 9.—Liverpool M.C. Annual Meeting, Law Association Rooms at 7.30 p.m.

April 9.—York and District M.C. Opening Run to Farndole.

April 11.—Carlyle C. and M.C.C. (Chelsea). Dance at Chelsea Town Hall.

April 12.—Public Schools M.C.C. Opening Run to Shere.

April 13.—Eastern Counties M.C. Run to Quendon.

April 13.—Essex M.C. Opening Run.

April 13.—Liverpool M.C. Opening Run.

April 19.—N.M.C.F.U. National Meet at Stratford-on-Avon.

April 21.—Birmingham M.C.C. Open Reliability Trial for Victory Cup.

April 21.—Dublin M.C.C. Dunlop Cup Trial.

April 26.—Public Schools M.C.C. Hill-climb.

May 4.—Bolton and District M.C. Reliability Trial.

May 4.—N.M.C.F.U., Sheffield. Reliability Run to Knutsford.

May 10.—The M.C.C. Speed-judging Competition.

May 21.—York and District M.C. Reliability Trial.

May 24.—Birmingham M.C.C. Social Touring Trial. Week-end to Llangollen.

August.—A.C.U. Six Days Reliability Trials.

N.M.C.F.U. (Coventry).

The Social Committee of the Coventry branch, N.M.C.F.U., has arranged an open run to Badby Woods on April 6th. Meet Pool Meadow at 2 p.m.

An Aldershot M.C.C.

Lt. M. C. Dudding, R.A.F., "Aston Villa," Ash Road, Aldershot, is desirous of getting into communication with motor cyclists in the Aldershot district, with a view to forming a club.

Harrogate and District M.C.C.

This club is holding its opening run on April 18th, and, as of old, the venue will be Richmond. The hon. secretary of the club is Mr. H. W. Fortune, St. James's Chambers, Harrogate.

Eastern Counties M.C.

The opening run and reunion of members will take place on April 6th, to the Bull and Horseshoes, near Harlow. Tea at 5 p.m. Active members, old and new, as well as prospective members (professional competition riders are not eligible), are particularly invited to take part. The following fixtures have been arranged: April 13th, Quendon; April 27th, Chelmsford. Hon. sec., Mr. J. W. Percival, 5, Ruby Road, Walthamstow.

The Motor Cycling Club.

The first event to be held this year by the M.C.C. is a speed-judging competition, which will take place on May 10th. A petrol consumption trial will be held in June.

The subscription of one guinea is now due, and no member can enter for the London-Edinburgh run, for which arrangements are now being made, unless his subscription has been paid.

The amount collected at the M.C.C. smoking concert for the St. Dunstan's Hostel was £32 odd. So far the club has been unable to find accommodation for the Easter tour. Hon. sec., Mr. Southcomb May, 15, Endsleigh Gardens, N.W.1.

Ystalyfera and Swansea Valley M.C.C.

It was decided at a meeting held in Ystalyfera on March 26th to restart this club forthwith. Appreciating that the need for unity amongst all motorists was never more urgent than at the present time, the club has decided on affiliation under the A.C.U. Division C scheme. The joint secretaries, Mr. T. P. Lewis, Gurnos, Ystalyfera, and Mr. Perkins, chemist, Ystalyfera, will be glad to hear from intending members. The annual subscription is 12s. 6d. The committee hope to run some interesting competitions during the summer. The captain is Capt. A. Lindsay, M.B. All motor cyclists in the district are cordially invited to join the club.

Rochester, Chatham, and District M.C.C.

A meeting will be held at eight o'clock to-night (Thursday) at the Royal Hotel, Rochester, to discuss the re-formation of the above club. An invitation is extended to all local motorists, including ladies. Honorary secretary, Mr. S. White, 3, South Avenue, Rochester.

Club News.—

Essex M.C.

The dinner arranged to be held at Frascati's Restaurant on Saturday, April 5th, will undoubtedly be a great success, nearly a hundred tickets having been disposed of.

The opening run arranged for April 13th will take place to the Green Man, Harlow, leaving headquarters, the Eagle, Snarebrook, at 11 a.m. Lunch will be provided at 3s. 6d. per head, and all members who propose attending should advise the captain, Mr. F. A. Applebee, at 208, Great Portland Street, W.

The committee have obtained the first refusal from the Southend Corporation to hold a race meeting upon the promenade, and, subject to sufficient support being promised, a meeting will be run during the summer.

Coventry and Warwickshire M.C.

At a general meeting held last Friday, this well-known Midland club was formally revived. Mr. V. A. Holroyd was in the chair. Mr. Edward Manville, M.P., was elected president. The committee consists of Messrs. V. A. Holroyd (chairman), W. F. Grew, Ambrose and David Elson, J. F. Spencer, W. H. Carson, A. Wright, S. Wright, F. Hulbert, G. E. Roberts, M. W. Danks, and Capt. Geoffrey Smith and M. Sampson. Mr. Arthur Wright, after a detailed statement concerning the club's financial position, which is very good, was re-elected hon. treasurer, and Capt. Maurice Sampson hon. secretary.

Many new members were proposed. The club will be more of a social character than the majority, and a provisional programme which has been drawn up includes an Easter Monday run to Malvern, a long-distance trial for fifty-guinea cup in May, Whitsuntide run, M.C.C. team trial, and a picnic in June. Interested motor cyclists and other motorists should apply for membership application forms from the hon. secretary at 19, Hertford Street, Coventry. The annual subscription is now 10s., and the first fifty new members enrolled will not be asked to pay the 5s. entrance fee.

The Junior Car Club (formerly the Cyclecar Club).

The chief item of business at the annual general meeting of the Cyclecar Club was the substitution of the name, the Junior Car Club, for the original title, concerning which the hon. secretary said a few words. He spoke of the difficulty of restarting the club under its old name, when the cycle car was practically dead. It was hoped that the R.A.C. would give the club control of the light car movement, and the title Junior Automobile Club had been suggested—a corporate body which offered the right to the Cyclecar Club to absorb itself in this body and adopt the title for a moderate fee. The R.A.C., however, did not see its way to grant the privilege asked for, and it then remained for the club either to go on its own lines and attempt to control the movement or join hands with the R.A.C. and get control eventually. It was decided, however, not to go against the R.A.C., and a satisfactory interview had been obtained with Mr. Julian Orde and the late Mr. Robert Todd, who promised

that a Light Car Committee would be founded on which there would be representatives of the Cyclecar Club. Mr. Orde had also promised that the Junior Car Club, when constituted, should be affiliated, and he would ask those members of the R.A.C. interested in the light car movement to serve on the Light Car Committee.

The following members were elected on the committee: Maj. Oates, Capt. Colver, Messrs. E. C. C. Starr, Stead, Westall, Burroughs, Nash, Boileau, Noble, Adamson, de Peyrecave, and Higgs.

Mr. Starr offered to present a cup for the committee to use in such a manner as to increase the membership of the Junior Car Club, which offer was accepted with grateful thanks.

Birmingham M.C.C.

Arrangements are now complete for the open reliability trial on Easter Monday.

Hon. sec., W. H. Egginton, 76, Earlsbury Gardens, Birchfields, Birmingham.

The B.M.C.C. is catering for the touring motor cyclist on such a scale as has seldom been attempted by clubs in the past. Apart from the usual awards to be won in members' competitions, the Austin Cup will be awarded to the member who gains most marks in members' competitions during the season.

The social touring fixtures embrace half-day, whole-day, and week-end tours to popular resorts. Some of these will be picnic tours. These tours should provide a means of enjoyment that is denied to the single individual. To encourage members to turn out regularly, marks will be awarded for each attendance, and special prizes awarded to the members who have the most marks at the end of the season.

A photographic competition will be coupled with the social tours and club competitions, and prizes awarded for the best set of pictures taken this year.

Marking for attendance will commence on May 1st.

N.M.C.F.U. National Meet.

The national meet will take place at Stratford-on-Avon on the 20th inst. A good programme is being arranged, and all members wishing for accommodation should write *at once*, stating length of stay, etc., to the organisers. Mr. F. Murray, "Strathmore," Wharfedale Road, Acock's Green, Birmingham, or Mr. T. Mallalieu, 32, King Richard Street, Coventry, who will endeavour to arrange for their requirements.

The Public Schools M.C.C.

The P.S.M.C.C. has now been revived. A general meeting was held at the R.A.C. on Wednesday last under the chairmanship of Mr. E. M. P. Boileau, a committee was elected, and a preliminary programme was drawn up.

The Chairman, in opening the meeting, referred to the former prosperity of the club up to the time of the war, and the great sacrifice made by many of its members, and thanked Mr. Browning for his services in acting as temporary hon. sec. during the last few months.

The committee was then elected, which consists of the chairman, Mr. E. M. P. Boileau, vice-chairman, Col. F. S. Brereton, Major, B. C. Barton, Messrs. A. J. Luce, L. P. Openshaw, Capt. M. G. W. Burton, Messrs. T. W. Loughborough, L. M. Meyrick-Jones, C. B. Winter-Lotimer, G. W. Bonham-Carter, S. H. Davis, C. Wright (hon. treasurer), and H. B. Browning (hon. sec.).

The programme for 1919 consists, up to the present, of an opening run, members meeting at the Bear, Esher, on April 12th, at 2.30 p.m., and a stop for tea will be made at Shere. It was decided to hold a hill-climb on April 26th, and later on to hold a week-end "touch-nothing" competition.

In the course of the meeting Mr. Browning (hon. sec.) was instructed to invite present members of public schools to act as representatives of the P.S.M.C.C. in every school. The hon. sec.'s address is Riverbank, Staines.

A Carden monocar at the Junior Car Club's meet last Saturday. For competition purposes this little machine is now classed as a car.

The Future of Motor Cycle Competitions.

Three Kinds of Competitions and Three Reasons Therefor.

By T. W. LOUGHBOROUGH, A.M.I.A.E. (Secretary of the Auto Cycle Union).

THE fact that pedal cycle racing has lost its old grip on the public and is now confined to a comparatively small, if enthusiastic, circle has led some dim-sighted critics to foretell a similar fate for motor cycling competitions. If the motor cycle had reached the same finality in design as the push cycle of ten or even fifteen years ago, there would have been some excuse for such forebodings. Even so, there could be no comparison between the two forms of sport. The combination of skill and nerve on the part of the rider, the perfect "tune" of the machine, the pure physical joy of speed and power that in a car becomes impersonal, and in the air is lost altogether, puts motor cycle racing in a class by itself, and will keep it there.

But racing *qua* racing or hill-climbing against the watch, fascinating as it undoubtedly is, is now, and will be for many years, the least of the three main reasons why competitions should be encouraged. The private entrant—strange blend of sportsman and mechanic, to whom speed and speed alone appeals—must, until the motor cycling millennium, be prepared to take second place to the trade rider, and to be penalised in reliability trials for checking in ahead of schedule. To the manufacturer, competitions appeal as opportunities for demonstrating the excellence of his wares, as advertisements of reliability and efficiency. Whilst to the third of the parties interested, those whose text is "the encouragement of the sport and pastime of motor cycling," the outstanding object is the improvement of the breed.

Three Reasons for Competitions.

Thus there are the three underlying reasons for motor cycling competitions—first as an incentive to progress, secondly as a demonstration of excellence already reached, and, thirdly, to provide one of the best forms of modern sport and relaxation. Every sort of competition from the T.T. to the least important club fixture can satisfy all these three requirements more or less.

In "blue riband" events, such as the T.T. and the Six Days, it is the duty of the Competitions Committee of the Auto Cycle Union so to frame their conditions as to provide such a spur to progress that the most lethargic of manufacturers must realise that a reputation made needs keeping. And that I submit is the reason why in 1912 the Auto Cycle Union was fully justified in promoting a race against the wishes of the majority of the trade, and, again, it explains why the proposal to confine such competitions to stock machines does not find favour with the controlling body. The more important open events organised by such clubs as, for example, those of Birmingham, Liverpool, or Bristol, or the Motor Cycling Club, are the golden opportunities for trade advertisement of current models. The more such competitions are

supported by the trade the better for everybody concerned, and not least, the motor cycle public. And, finally, we have the "closed" club competitions, where the sporting spirit should predominate, and where trade support in any shape or form may do more harm than good.

Three Classes of Competition.

In all three classes of competition the private sportsman has his chance. In the club events he should have the field to himself—in open events he should be able to win his gold, and in the Isle of Man a sporting chance must always be given him. He must be encouraged, for when motor cycles reach such a state of perfection that no further progress appears possible—if that can ever be!—then we shall look to the private rider to fill the entry list of the T.T. And in the meantime the trade should remember that just as the war has provided such a demonstration of utility that to-day manufacturers cannot cope with the demand, so when the factories get into full swing and immediate wants are satisfied, further demonstrations will be needed to keep the order book full. Therefore I hope to see during the coming summer a goodly number of open club events all really well patronised by the trade.

The Six Days Trial.

There will be no T.T. this year. The Union realises that production is the main requirement to-day, and that manufacturers cannot in fairness be asked at the present time to devote the time to experimental work that such an event calls for. On the other hand, to continue to concentrate on production alone means stagnation in design, and so in the autumn I look to the Six Days Trial to cover with laurels those who have seen beyond the requirements of the current year, and I trust that, owing to successful participation in this important trial, more than one 1920 model will have something more to its credit, and a stronger appeal to the public, than a mere place in the 1919 show.

A 1919 G.N. at the Junior Car Club's rally at Burford Bridge last Saturday.

LETTERS TO

THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Herford Street, Coventry, and must be accompanied by the writer's name and address.

IS A T.T. RACE POSSIBLE?

Sir,—I have read the letter in *The Motor Cycle* of March 13th, signed Vivian Olsson, with great interest. Having served for three and a half years of the war in France with the Mechanical Transport, I should like to state that, should a race for amateurs be arranged, as suggested by Mr. Olsson, in my opinion it would meet with the greatest possible success with ex-D.R.'s, etc., and I should like to put my name down as a competitor in the Senior race.

R. WHITE (Capt.).

PULLEY GRIP.

Sir,—I was much interested in "Graduate's" letter on the Grado pulley. Although it has often been stated that the belt pulls into highest gear, this is not borne out in practice. If it were, the makers would fit the ball thrust washer between the control rod and pulley, and not, as is the case, between the sliding flange and thrust collar.

I have nothing but praise for the pulley in use, except the harsh action on belts.

Has anyone experience of Whittle with the Grado? If so, I should like to hear how it works.

R. L. BOYD.

UNNECESSARY RESTRICTIONS.

Sir,—We beg to call your attention to the serious inconvenience of not being able to send a complete motor cycle by passenger train that is over 112 lb. in weight. We cannot see the necessity for such a restriction as this remaining in force now that the war is over, and we think the matter should be taken up, because at present it is necessary to detach certain parts from the machine to get down to the required weight, and if the machine is sent by goods-train it generally takes a considerable time.

S. A. NEWMAN, LTD.

GROUND CLEARANCE.

Sir,—I read with much interest the article on Mr. R. G. Baird's machine in your publication of March 13th. As you say, it is carefully thought out. There is, however, one point which struck me rather forcibly in the design, namely, that of ground clearance.

The ground clearance is given as $3\frac{5}{8}$ in., and we are told 700×85 mm. tyres are fitted. Now 85 mm. is just over $3\frac{1}{4}$ in., and I judge that with one tyre flat the ground clearance would be about $1\frac{1}{2}$ in.—not more.

It makes me shudder to think of the consequences to the crank case and engine (to say nothing of the rider) of a burst on a road with a surface such as is encountered nowadays.

B.E.F.

R. H. CHAPLIN, SEC.-LT. R.E.

POWER REQUIRED FOR SIDECARS.

Sir,—We note in your report of a paper read before the I.A.E. on "Engines for Sidecar Motor Cycles," by Mr. Eric Caudwell, a striking paragraph, which runs as follows:

"Only engines of over 500 c.c. piston displacement were dealt with, as with volumetric efficiencies at present attained a smaller engine was considered quite unsuitable for serious sidecar work."

To this sentiment we desire to demur in the strongest possible manner, though we should have been prepared to agree had the phrase been "in the past" rather than "at present."

Mr. Caudwell is evidently unaware that certain motor cycle designers have made considerable progress in the saving of weight and in the attainment of high brake horse-power from engines of small capacity. The A.B.C. engine has a capacity of 400 c.c., and, because it has a really good volumetric efficiency, it will take a sidecar anywhere. But the

A.B.C. combination, with *personnel* of the average bulk, will not weigh the 700 lb. Mr. Caudwell quotes; it will rather be in the neighbourhood of 500 lb. We do not wonder that some designers demand a sidecar engine of 1,000 c.c., for if they want to carry a couple of hundred pounds of useless weight about they will require more power for this purpose.

But we would remind Mr. Caudwell that weight does not mean power, any more than big cubic capacity means power. Horse-power is determined by engine dimension, r.p.m., and mean effective pressure. By increasing the value of the two latter components we have been able to reduce that of the former to a very notable extent, and this, we are satisfied, is the only direction in which true progress can be made. We claim that in the A.B.C. sidecar combination the ratio of total weight, divided by weight of passengers, is lower than in any other combination of similar hill-climbing and speed capability.

THE SOPWITH AVIATION CO., LTD.

ALAN R. FENN, Sales Manager.

A TABLOID HISTORY OF AIR-COOLING.

Sir,—“Road Rider” is right when he maintains that a rotary engine is the most wasteful of all types with petrol and oil. The Gnome Monosoupape was a very remarkable engine as engines went in those days, but its very low weight for power ratio hardly compensated, at any rate as far as ordinary engineering utility went, for the very marked disadvantages that went with it, the chief being heavy fuel and oil consumption and liability to fire. For aero work, the fact that it was, in its lightest form (with no variable timing), uncontrollable did not matter very much.

The Gnome types of rotary must, in the light of later design, be regarded as “back numbers,” and it yet remains to be proved that the more improved types, the Le Rhône, Clerget, Canton-Unne, Bentley, etc., can really favourably compare with the latest radials for fast scout work.

“Road Rider’s” point about the dead work performed by rotaries in overcoming their own air resistance is not altogether tenable. It must be remembered that the “flywheel effect” is considerable.

REVS.

Capt. C. T. Newsome, R.A.S.C., who before the war was a successful competition rider on a Rover motor cycle. In future his activities will be in the car world.

VALVE POSITION.

Sir,—I have read very tempting descriptions of several new motor bicycles in your paper lately, yet all but the vertical cylindered ones seem to have horizontally acting valves or inclined ones.

I have been a motorist for seventeen years, though a motor cyclist for only about six. I want a multi-cylinder machine, but I fight shy of valves arranged as above. I consider two cylinders enough, though might go in for a four, if not more than $3\frac{1}{2}$ h.p., not too heavy, nor the engine too much like a toy.

W. REGINALD WILSON (M.A., M.B.B.C. Cantab.).

FROZEN OIL.

Sir,—Referring to Mr. J. Simpson's letter on page 283, of your issue of March 29th. He asks what objections there could possibly be to placing the oil tank at the back of the cylinder. The answer, of course, appears on page 268 of the same number, illustration 4, which shows the oil tank on seat tube of the Rudge Multi, the oil pump of which is worked by Bowden mechanism actuated by the pedal close to the right footrest. In addition to giving a more sheltered position for the oil tank, the rider's hands are never soiled as in working a hand pump, and the top tank holds petrol to its full capacity, and keeps much cleaner than when an oil tank is combined with it.

RUDGE-WHITWORTH, LTD.

Sir,—With reference to your correspondent's letter over signature of J. Simpson, this conveys to my mind the inadvisability of using the so-called air-cooled motor oil at all. Can any of your expert correspondents enlighten me on the subject? As far as I can see, the greatest desideratum in internal combustion engine lubrication is that the oil should maintain its body at a high temperature—in other words, to have a good high viscosity. Why should an oil have to be thick to lubricate efficiently, as on application of heat it undoubtedly is reduced to a very liquid state. I had the same trouble as your correspondent, and experimented with a high-class brand of water-cooled motor oil. I may say I have used this with perfect satisfaction on an Indian, O.K. Junior, and at the present time I am using it and nothing else on a 4 h.p. Douglas combination and a $2\frac{1}{2}$ h.p. Levis. My wife, who is an enthusiastic rider of a lady's model O.K., uses the same oil, and I find I am getting just as efficient lubrication as I got with a so-called air-cooled motor oil. Some makers claim that their air-cooled oils have a good cold test, but I have yet to find an air-cooled oil that does not congeal in winter.

F. TAYLER.

REAR LIGHTS ON CYCLES.

Sir,—I am glad to see you grant Mr. Cooke space to air his opinions upon this question, but regret the push-cycling press does not do likewise with those who write antagonistic to their views, as I know from personal experience.

Your correspondent mentions that motor cyclists ought to be thankful to the National Cyclists' Union for taking up the cudgels for them. So far, so good; but we do not desire to be associated with a class of road users whose squeal like Germans at any little thing which they think will be a trouble or expense and place no value upon the general utility of the thing. During the war, when all head lighting was reduced, their agitation against rear lights was quite as rabid as now, and their press was so full of the subject that it seemed to exclude all cycling news, and became a laughable production upon rear lights and wastage of oil. Another much aired grievance of theirs was that no extra food was allowed a cyclist when on the road, as they claimed their pastime made them more hungry than other people who did not cycle. Your readers can judge for themselves the class of agitator behind all this, and will refuse to associate with such bad "sports" in any petition they get up.

Cyclists ride a machine which is not taxed in any shape or form, and has but one obligation placed upon it, and that as to lighting, yet they fuss and fume and pester the Home Secretary about their "grievances," whilst the motorist is taxed all round, was restricted in or entirely barred from his petrol during the greater part of the war, has had to carry a rear light for umpteen years, is told he must carry two brakes, and have number plates fore and aft, and illuminate them at night, yet, being a "sport," carries on with a good grace; but what a comparison he makes with the spoilt-child cyclist.

CORPORAL ELSIE.

THE THREE-JET BINKS CARBURETTER.

Sir,—With reference to the recent correspondence appearing in your pages regarding the three-jet Binks carburetter, it will probably interest some of your readers to know that getting rid of the blind spot between the second pilot and the main jet is merely a matter of adjustment.

On a Norton 4 h.p. motor cycle (633 c.c.), driven solo with No. 2 spirit, the combination 00, 3, and 8 answers very well, and for heavy sidecar work Nos. 00 or 0, 4, and 10 were fitted.

Widely varying grades of spirit or extreme ranges in atmospheric conditions call for a different setting. The above figures are the results of a series of experiments carried out during the past month, and are given for what they are worth. I might add that the petrol consumption figures were very good, showing a decrease of over 15% when compared with the best of three other instruments tested.

D. R. O'DONOVAN.

AIDS TO STARTING.

Sir,—I agree with "Tired Tim" in every remark he makes about difficult starting. My 'bus is a little $2\frac{1}{2}$ h.p. Hobart-Villiers two-stroke, single gear $5\frac{1}{2}$ to 1, and I have to get up early every morning to go to business on it. My usual procedure is to give the engine a fountain-pen filler full of petrol (?) in the sparking plug hole, and another in the Amac carburetter air intake, with both valves wide open, flood the carburetter freely, air valve closed, throttle half-way open. The engine will usually start in about three pulls of the back wheel, and when it has run warm will usually start fairly easily on the road.

Before I thought of putting juice in the crank case *via* the carburetter intake, I used to run for about one hundred yards before the engine took it into its head to fire at all, and then it used to blow back into the carburetter as soon as my weight landed on it.

In conclusion, I might add that the Hobart is a lovely little 'bus, and was perfectly satisfactory when I used Pratt's No. 1. The usual disclaimer.

Roker.

WEARY WILLIE.

ELECTRIC LIGHTING BY DRY BATTERY.

Sir,—In your issue of March 20th and several recent numbers of *The Motor Cycle* I have noticed the question of lighting solo machines with dry batteries and secondary cells.

The great possibilities of the Edison nickel iron alkaline cell, as a secondary cell, have not yet, to my knowledge, been mentioned.

Its advantages over the ordinary lead cell (with some disadvantages and remarks) may be of interest, and are roughly as follows:

ADVANTAGES.

(1.) *Strength*.—Capable of very rough handling, knocking, vibration, etc.; the case, or container, being made of nickel steel (instead of celluloid). Obviously, mechanical strength and rigidity result. "Active" material in plates less liable to come away and short circuit.

(2.) *Discharge and Charge*.—Very much higher rate of discharge: can be short circuited without damage. Can be discharged until voltage disappears—range of d.p. 1.5—0.9 volt (ordinary conditions), usual working voltage 1.2 volts (per single cell). Not damaged by being overcharged. May be left undischarged for a long time without damage.

(3.) *Longer Life: Maintenance*.—Outlast two or more lead cells. Much less attention required. No corrosive spray given off; hence no terminal corrosion.

DISADVANTAGES.

- (1.) Costs more: outweighed by advantage 3.
- (2.) Less efficient (electrically).

REMARKS.—Weight of each type almost the same. Eight watt-hours per lb. weight: complete cell for 30 amp.-hour cell. War stopped development in Great Britain and abroad, generally, it being an American product.

From the foregoing, the Edison cell would appear to be greatly advantageous for motor cycle use, where excessive vibration, rough handling, and neglect, play havoc with the ordinary lead secondary cell; as some have had the misfortune to experience.

In conclusion, I should mention I have no interest or connection with the Edison Company.

G.P.G.K.

THE MOTOR CYCLE TUBE

REMEMBER the great strain each tube carries; the jolt of bad surfaces at great speed and the shock of crossing tram lines.

Get Dunlop motor cycle tubes in your covers—they're moulded to the exact shape of the outer cover: each size is a perfect fit and each tube of accurate section size.

Cut out tube troubles and go on your way with the greatest comfort.

Prices for tubes of the following sizes:

	26 x 2 ¹ / ₈ "	26 x 2 ¹ / ₂ "	26 x 2 ¹ / ₂ " (to fit 2 ¹ / ₄ " rim)
Endless	8/9	10/3	11/9
Butt-ended	11/9	13/3	15/-

LOSING ONE'S PROP.

Sir,—“Revs.” ignores two not uncommon causes of a lost prop, i.e., a minor engine derangement in flight or a partial stoppage of the pilot jet. His letter puzzles me, as most aero carburettors are fitted with adjustments at the throttle stop. Mere wear on the stop could hardly escape notice during the most casual engine tests before a flight.

As regards restarting an engine by diving, every make of stationary engine can be restarted in this manner if fitted to an aeroplane which can safely be dived at the requisite speed. The Rolls-Royce, being a geared engine, requires an unusually steep dive, and is mainly fitted to big machines which are not normally nose-dived. But if “Revs.” can get hold of a safe machine fitted with this engine and cares to satisfy himself by an actual test, I will send a very handsome wreath to his funeral if the engine does not start after, say, a 300ft. dive at 100 m.p.h.

TORQUE.

Sir,—Having read with interest the letters of your correspondents “Torque” and “Revs” on the above subject, I would ask “Revs” what he really means by “losing his prop.” Does he mean while in the air or on the water?

I have had considerable experience with all makes of engines, both rotary and stationary, on seaplanes, and have never seen a propeller stop rotating whilst the machine is in the air, unless the engine seizes, and then the propeller-shaft generally breaks; but pilots very often lose their prop on the water, especially while training.

I agree with “Torque,” and should like convincing proof of any service engine, stationary or rotary, that will not restart by diving. As to prevent the engine restarting, provided everything was in order, the prop would have to stop, and the “air friction” is certainly not insufficient to turn the engine over against the compression, or the “propeller slip” would be too great to drive the machine forward when the engine was running; one might as well say the “friction” between the road and wheels of a car coasting downhill with the engine switched off was going to be insufficient to restart the engine when the bottom of the hill was reached.

AIRMICK.

Oundle.

THE ADVANTAGES OF A TWO-STROKE.

Sir,—I was not in the least surprised to see that two correspondents have evinced great interest, and, it must be admitted a certain amount of thinly-veiled scepticism at Mr. F. W. Varney's account of the performances of his Levis. When first I read his letter, I, too, felt inclined to write it off as “hot air,” but, on consideration, I came to the conclusion that he did not use the term “average speed” in its usual and technical sense. I feel sure he meant that if one took the average of his *maximum* speeds they would work out at 35 and 45 m.p.h. respectively. And I feel it is only just to him to point this out to your readers. Nevertheless, I feel that he would be wise to publish the data from the diary or record he has kept, to prove to the unbelievers that what he says is true. I envy him his machine.

My last mount, a 2½ h.p. T.D.C. Wolf, had a top speed of 40 m.p.h., and once, by driving it in a brutal manner, I covered the twenty-nine miles from Lancaster to Windermere in fifty-eight minutes. I generally found that on a long run I could average 20 m.p.h. with careful driving in towns and hustling in the country. This is what makes me feel sure that Mr. Varney means what I suggest and not what he says.

With regard to his hill-climbing feats, I must confess that they take my breath away. I suppose there is no likelihood of his mistaking his hills. I once thought I had climbed “Rest and be Thankful,” but found out afterwards that I was not within five miles of it.

I feel that Mr. Varney owes it to himself to give us fuller details, and that he would confer a great benefit on the motor cycling confraternity if he would explain “how he does it.”

(REV.) M. P. SARGENT.

Sir,—With reference to the letter from “Enquirer,” published in *The Motor Cycle* of February 20th.

I run a 1915 two-stroke Clyno two-speed with Henderson model A featherweight coachbuilt sidecar, which has given every satisfaction during the past three years, and is still running well.

Owing to petrol restrictions and military duties, I have only covered about 6,000 miles with this outfit. During this mileage the replacements have been one new tyre (a 2½in.

being substituted for the 2in. on bicycle rear wheel) and one new belt, which are still in good condition, and two or three washers for inlet and exhaust ports. No replacements have so far been made to the engine, although cost of replacement parts for this type of engine is quite small.

A speed of 25 m.p.h. can be comfortably maintained, except on stiff hills, when 18 m.p.h. can be attained on low gear. I have travelled from London to Margate, Dover, Folkestone, Hastings, etc., and also various parts of Essex, and have not come across a hill that cannot be climbed with this outfit. Of course, freak hills are not attempted.

My weight is about twelve stone and passenger nine stone. Petrol consumption about 80 m.p.g., and plenty of oil is used.

There are many advantages in this type of combination to the man who is content to maintain the legal speed limit, and exercise reasonable care in driving, especially when turning corners. The engine is very simple, first cost comparatively small, tyre mileage good, and the machine is easy to start; the petrol consumption is, however, rather high, although my 80 m.p.g. could no doubt be improved, but with a loss of power, by fitting a smaller jet (I use a No. 30 Senspray).

The engine is decarbonised about every 700 to 1,000 miles, and this is quite a simple operation, which can be carried out in a couple of hours.

In conclusion, the Clyno two-stroke is an ideal machine for this purpose, as it is sturdily built and is fitted with an efficient two-speed gear and hand-controlled clutch.

Leytonstone.

CLYNO TWO-STROKE.

MOTOR CYCLES FOR THE MAIMED.

Sir,—I was interested a few weeks ago to see a correspondent enquiring what machines were suitable for a rider who had lost his right leg, and a reader's reply mentioning certain machines which had the foot brake operated by the left foot, and might, therefore, be considered suitable. This, I am afraid, is not entirely the case. Having ridden, with an artificial limb, various makes of motor cycles for some years, I should like to give a word of warning.

Used with a sidecar, any machine which has the foot brake on the side of the sound leg and a hand-controlled clutch is, of course, quite suitable and safe, and one's disability makes no difference at all. Riding solo, however, is a different matter. In case of an emergency, when one must stop all headway instantly—as, for instance, if a child rushes into the road or something emerges suddenly from a side road—one is placed at a severe disadvantage, for the reason that the sound leg must be placed on the road to hold up the machine, thus leaving the front brake only for use. Suddenly applied at speed, this is bound to cause a bad swerve at least, and a certain spill on a greasy road. Almost worse still, on some machines, the front brake is no use at all, being little more than an ordinary push cycle brake.

The remedy consists in fitting auxiliary hand control to the rear brake. A strong lever, with big leverage and heavy Bowden cable, should be fitted close to the exhaust lift, so that both levers can be gripped at once, thus shutting off the engine and applying the back brake at the same time, leaving the other hand free to apply the front brake, de-clutch, or throttle down as requisite, also leaving the sound leg free to hold up rider and machine if necessary. The foot brake should be left *in situ* for normal use and holding the machine down long hills.

In conclusion, I would like to say that the P. and M. and Enfield, both fine machines, are ideal for riders who have lost the use of the left leg.

A 1921 MACHINE DE LUXE.

AN ENGINEER'S
IDEAL.

Entire Framework, Forks, Tank, Mudguards,
to be made from thin Sheet Steel.

A proposed design for an all-weather machine. The complete unit and gear assembly is mounted in a sub-frame in the centre of the frame, which can be withdrawn to facilitate overhauling.

EVERY motor cyclist has his ideal, which usually is a composite comprising the best features of the many machines he has tried and seen. The motor cycle illustrated on this page is quite another proposition, and while being frankly ideal it is intended to be a suggestion for the Rolls-Royce type of machine to which many contributors have referred from time to time.

Some of the features of the design are not entirely original, but since they offer many advantages over present-day methods they are incorporated in a general design as indispensable in the writer's opinion, if the outstanding faults of the average motor cycle are to be overcome. This refers particularly to the present type of tubular frame, which involves the most awkward construction possible in the attachment and accommodation of all the sundry parts of a machine, the inaccessibility of the engine and transmission, and the difficulty of cleaning a machine in a rapid and satisfactory manner.

The general design of the proposed machine may be summarised in the following:

Frame.

The entire framework, including forks, petrol tank, mudguards, valances, carrier, tool and accumulator boxes, is made up from thin sheet steel stampings and welded together with flush joints wherever possible. By this form of construction, a strong box-like framework can be utilised in the central section of the machine around the power unit where the greatest strength is required, with the corners rounded off everywhere to give an easy surface for cleaning purposes. The gauge of the sheet metal throughout should be graduated according to the stresses set up in the main frame under running conditions, but in all other places the metal could be reduced in gauge to cut down weight. It is not suggested that this type of frame

would be lighter than the standard tubular pattern—on the contrary, it may be slightly heavier; but the immense advantages gained by the pressed steel frame outweigh such a minor objection. The tubular frame was discarded years ago for pressed steel construction in automobile chassis, yet, the writer contends, we still cling to old methods in motor cycle manufacture.

Sub-frame for Power Unit.

In the sketch of the proposed frame, a completely unobstructed opening is arranged in the centre for the reception of the engine and gear unit, which is an entirely separate assembly in a sub-frame of its own. The front forks, mudguard, side valances and number plate are built up as a complete unit in sheet steel, the only tubular construction used in this locality being the actual steering head itself. For front suspension, a single semi-elliptic leaf spring is suggested, with adjustable ball bearing links between the main frame and forks.

Sheet metal construction of the main frame is extended right to the rear in order to accommodate a suggested form of rear spring suspension for the rear wheel and to provide automatically a carrier and mudguard with side valances as well. In this case, the portions of the rear section of the main frame which require extra strength could be stamped out of fairly thick metal, whilst such pieces as the valances, etc., which perform merely light duties, need only be built up in thin sheet steel and welded in position with flush joints.

The suggested springing of the rear wheel is shown in the drawing. If the spindle of the wheel is bolted to a vertical loop working in slides in the frame and anchored in a slot at the top, the wheel cannot move in any other than a vertical direction. At the same time, the

Suggested mounting of the power unit and gear assembly in an enclosed aluminium sub-frame. The position of the magneto contact-breaker will be noted.

A Thorough Understanding

of the Working of Your Machine
will save You Pounds in the Year.

"The Amateur Mechanic," written by skilled craftsmen in simple, non-technical language, and helpfully illustrated by practical

"How-To-Do-It" Pictures, is The Book for You.

The article on OVERHAULING A MOTOR CYCLE has four illustrations, and the following titled sub-sections: Summary—The Wheels—The Frame—The Tank and Fittings—The Carburetter—How the Engine Works—Overhauling the Engine—The Driving Gear—The Ignition Apparatus—The Brakes—The Reassembling. The following are titles of the sub-sections in the article OVERHAULING A MOTOR CAR: Summary and Explanation—The Preliminary Examination, chiefly by sight—Bearings—Carburetter, Couplings, etc.—Flywheel, Clutch Fork, etc.—Gauge Gear—Steering Gear, etc.—Frame Springs, etc.—The Ear Test—Testing the Engine—Compression Testing—Testing with the Engine Running—Worn Bearings—Knocking—"Popping"—"Hunting"—Silencer at Fault—Clutch—Change Gear—Undue Heating of Circulation Water—Lubrication—Testing on the Road—Ignition—Valve Timing—Defective Compression—The Shafts. A COMPLETE OVERHAUL: Testing for Alignment—Swivel Bearings—Wheel Bearings, etc.—Tyres—Removing Valve Chamber Covers—Grinding in Valves—Removing the Engine—Testing the Truth of Pistons—Removing Flywheel—Timing Gear—Magneto—Gudgeons and Pins—Case Hardening—Removing Piston Rings—Engine Repairs—Testing Bore of Cylinders—Truing Journals—Truing Brasses—Bedding the Crankshafts—Big End Bearings—Renewing Clutch Leather—Ball Bearings—Gear Renewing—Oiling Axle Springs—Aligning Gear Box and Engine—Reassembling Engine Accessories—Brakes, etc. This article has 56 practical illustrations and diagrams.

It is full of Money-saving Information for every Citizen.

It Shows You How

To paint and paper a room—To sole and heel and patch boots and shoes—To mount maps—To bind magazines and to re-bind old books—To make a pair of hand-sewn boots—To restore colour of old brown shoes—To make household furniture—To re-seat chairs—To upholster sofas, etc.—To install a speaking-tube—To make a wire bracket for placing over oil lamp or gas bracket so that food can be heated over it—To clean a Primus or other stove—To repair bicycles—To overhaul a motor car—To repair motor cycles—To work in metal—To colour metals—To make a garden frame—To repair water taps—To varnish a violin—To remedy damp walls—To repair the piano—To make a padded chair from an old cask—To make malicart and perambulator hoods—To mend pen-knives—To stuff animals—To dress furs—To stuff and mount birds—To do wood inlaying—To cure a smoky chimney—To prepare working drawings and how to read working drawings—To make a chemical weather glass—To renovate a grandfather's clock—To make invisible ink—To make garden furniture, arbours, arches, seats, summer-houses, tables, etc.—To use metal-drilling tools—To clean book-covers—To renovate mirrors—To upholster furniture in leather cloth—To mend broken china—To do fretwork—To build a boat—To make a canoe, etc.—To lime-white poultry houses—To do gold-plating and silver plating—To clean a watch—To mend keyless watches and ordinary watches—To distemper ceilings and walls—To make picture frames and to frame pictures—All about curtain fittings—To make metal castings—To make tracing paper, waterproof paper, fireproof paper, etc.—To clean paint off glass—To fit up a motor workshop—To clean boilers—To fix an anthracite stove—To re-gild and restore picture frames—How to use spanners—To make doors and windows draught-proof—To paint walls—To make a garden path—How to do nickel-plating—To cure noises in hot-water pipes—To make soap at home—India and glue varnishes—To clean and repair locks—All about acids for etching metals—Micrometers, how to make and to use them—How to make plaster casts, etc., etc.

Buyers praise it.

Mr. A. J. TATTON, Keresley, writes:

"I feel convinced I could make or repair most of the subjects dealt with if I relied only on the beautiful illustrations."

Mr. WILKS, Winson Green, Birmingham, writes:

"The Amateur Mechanic" is one of the finest examples of non-technical information I have ever seen. I have found what I have been looking for for months. The low price at which they are offered and the splendid system of payments are national benefits."

This Practical Work

Explains the Mechanism, Cleaning, and Overhauling of Your Car.

"The Motor Cycle" says of
"The Amateur Mechanic."

"In this work we come across special articles which should interest our readers, such as those on Filing, Screw-cutting, whether by lathe or by hand, How to use spanners, Metal-turning, Metal-spinning, an article on the overhauling of the motor cycle, another on the overhauling of the car, Taper-turning, Home-made drilling machines, Emery discs, bobs, and wheels, Hardening—and on fitting up a workshop for motor and general repairs. . . .

The motor cyclist will find much to learn from this well-written and copiously illustrated work. . . . We have had a copy of 'The Amateur Mechanic' in our possession for some years, and many useful hints and tips have been gathered from it. It should find a place in the library of every practical motor cyclist."

The Rev. F. R. SWAN writes:

"It is compiled for those who want to learn how. . . . No better present for a disabled hero."

Leeds, Manchester, and Nottingham.

The 1921 Machine de Luxe.—

box construction of the rear section of the frame should, provided it is suitably strengthened laterally by cross ribs or plates, prevent attempted side oscillation of the rear wheel whilst on a bad road with a heavy sidecar. A long semi-elliptic spring anchored at the front end on either side of the frame should provide for comfortable suspension, whilst the rear extremities of the springs are supported on extensions from the vertical loop connected to the rear wheel inside the frame and valances.

Engine and Gear Unit.

A 6 h.p. V twin is the power unit most favoured by the writer. It is a type that has proved itself capable of pulling healthily, and one that develops no mysterious troubles. This refers more especially to sidecar work when an engine with proved stamina and power is inevitably required. The engine incorporated in this design would have such features as overhead valves, detachable heads, outside flywheel, balanced crankshaft, cast iron cylinders, and aluminium pistons: the capacity of the engine being in the neighbourhood of 800 c.c. Long stroke and moderately low compression would be adopted to ensure flexibility on top gear, the maximum of efficiency being sacrificed to gain cool and tractable running.

The lubrication of the engine should be entirely automatic with the whole of the oil carried in the sump. The system whereby a small gear pump in the base of the crank case feeds oil direct through a nozzle on to the big ends and direct to the main shaft bearings appears to be by far the best, since the lubrication is not dependent on the maintenance of anything but a very low pressure, and is correspondingly more reliable. With this system, two adjuncts are indispensable for reliability, *i.e.*, an *easily detachable* gauze filter extending across the whole of the sump above the oil carried in the crank case, and an oil circulation "tell-tale" at the side of the engine within sight of the rider.

Automatic Carburettor.

For an ideal machine an automatic single lever carburettor is a necessity, with an auxiliary device and hand control fitted on the carburettor itself whereby the flow of petrol in the jet can be varied as with altitude control embodied in aero engine carburettors. This arrangement is preferable to the ordinary extra air inlet attachment which is not always a success.

In order to give ample accessibility the magneto is mounted on a platform at the rear of the crank case, and driven by a horizontal layshaft and skew gear from the cam box. It would, therefore, be an easy matter to attend to the contact breaker, since it could be arranged to face towards the right side in an open position.

Chain drive throughout is suggested for the transmission, and a three-speed gear box (sliding dog type) with a simple form of dry plate clutch is located

behind the engine. In order to give the maximum of accessibility, the engine, gear box, and clutch are mounted complete in an aluminium sub-frame, which should be arranged to slide sideways on guides from the main frame after the rear chain, controls, and silencer have been uncoupled. By this form of construction the complete outfit can be bodily lifted to a bench and overhauled at leisure. The aluminium sub-frame could also be designed to carry the lighting dynamo on brackets immediately behind the crank case in addition to the magneto, the dynamo being driven by bevel gears from the same shaft that operates the magneto. To save the complication of chain cases and to give a smooth surface for cleaning purposes, the sides of the aluminium sub-frame (which would have large detachable inspection doors) are extended sufficiently high to cover in the gear box, clutch, chain drive, crank case, and flywheel of the engine, so that the only portions visible would be the cylinders, magneto, contact breaker case, gear box, and clutch control arms, and kick-starter pedal. The final drive is on the right side of the machine, with a chain case fitted with a large cover similar to a lid on a violin case, to render it an easy matter to inspect and adjust the chain, when a sidecar is attached.

Diagram of rear spring suspension. The rear wheel moves vertically with the loop member in the slides A, B, and C attached to the frame.

General Details.

As so far very few machines have been turned out with even moderate protection from mud and wet, efficient mudguarding would be of the first importance in an ideal machine. Practically all the dirt that reaches the rider on a wet day arrives through the forward rush of the machine carrying the rider into the mud which is dripping and drifting backwards from the front mudguard and its stays. This might be eliminated by deep side valances and a wind deflector which would deflect the rush of air downwards. In both front and rear valances small doors should be fitted, in order to allow a hose to be inserted to wash and scour mud accumulated after a journey. Protection to the rider would also be given by wide footboards, attached to the main frame by short laminated springs.

On the subject of brakes, the internal expanding type for front and rear seems the best, the rear brake being fitted inside the chain case and operating on the rear chain wheel in a fully-protected position. Possibly the two brakes might be interconnected and operated from a single pedal through a compensating device.

The price of a machine as outlined would be high (unless one-type mass production was employed in its manufacture), but even so it has many advantages approaching those associated with a car, in regard to accessibility, comfort, and ease of cleaning. Many of the suggestions given may be open to criticism, but the broad outline may conceivably open up new ideas to other motor cyclists, who, like the writer, have learnt lessons derived from considerable experience on the road and in the workshop.

MILLIMETRE.

ASPECTS AND PROSPECTS.

A Rhapsody on the Pleasures
of the Motor Cycle and the
Freedom of the Roads.

THE late war has been responsible for many things, but I never thought it would have the effect of making me into a motor cyclist. The fat, unsuspecting years of slothful ease—they were really not so very slothful or easy, but it seems to be the fashion to call them so—before the war were not very good for me or for my figure, but the days since I left the army, to give my attention to work I was presumed to be more useful at, have had a good effect on the latter at any rate, and now many things—including the motor cycle—do not daunt me as they once did.

In the "Dear Dim Days."

I do not put it down entirely to this, however. Everything changes, and, undoubtedly, among other things motor cycles. When I first rode one, in the dear dead dim days before even I had a car, they were uncanny things—the direct descendants, in the opinions of many people, of high bicycles—and their riders were deemed super-athletes beyond all question when they were not looked upon as self-homicidal maniacs. Perhaps there was reason; motor cycles in those times were mere ordinary cycles with apologies for motors hung about their frames, and in the days when all automobile machines had to carry batteries and commutators and tremblers of one or other of the few sizes extant, it must be acknowledged that they could hardly be described as particularly neat and compact contrivances.

Kindred Explorers.

But we were all classed as *Yahoos* together, motorists and motor cyclists, and we had to weather the same storms. For one thing, I believe—through the mists of the past it is difficult to sort one's old memories—that we all made much the same noises; nowadays some say that an internal combustion engine makes a noise in inverse ratio to its horsepower.

One might trace in the columns of *The Autocar*—if it were worth while—my automobile education and growth, and, as my thoughts go back, I can call to mind that in their beginnings my hotel stable companions were usually motor cyclists, and that my "shop" was their "shop," and theirs was mine. We were kindred explorers and sufferers, but we had kin joys; there was never any jealousy or quarrelling between the two schools, except on the part of some very superior persons—men and women who could not think, who could not know, and who never realised that the big, swollen, ungainly, sumptuous tonneaux they leant back in had come but very few years back from the little machines they so

By OWEN JOHN
(of "The Autocar").

affected to look down upon. For the father of the car was the motor cycle, just as the motor is the absolute direct ancestor of the modern aeroplane. (The excellent gentlemen who lately, after a large luncheon, gave it as their opinion that flying owed nothing to motoring were much of the kidney of the Cockney sportsman who would not believe a certain bird could be a pheasant because it was not yet October, and I am only sorry I was not present to press the point.)

But I stray—they always let me stray in *The Autocar*, and I have got into the habit of it—I am tracing genealogies and relationships to do honour to my old love on the return of my admiration for her. The motor car owes just as much to the motor cycle as the last thing in banjos does to the earliest string instrument that ever twanged. There is more than fancy in the connection. Harken to a verse of Rudyard Kipling's "Song of the Banjo"—as inspired and wonderful a song as has ever been written, a throbbing ganglion of the nerve-ends of many lifetimes compressed into half-a-dozen little pages—and note how there is something very close between the thing he wrote about and the marvellous contraption that I am telling of.

"The grandam of my grandam was the Lyre—
(O the blue below the little fisher huts!)
That the Stealer stooping beachward filled with fire,
Till she bore my iron head and ringing guts!
By the wisdom of the centuries I speak—
To the Tune of yesternorn I set the Truth—
I, the Joy of Life unquestioned—I, the Greek—
I, the everlasting Wonder Song of Youth!"

I am not sure I have not stumbled on the right name for the motor cycle in the last line, for though my youth, as men count years, is behind me, yet I can conjure up no fairer vision of the perfection of young days than a blue spring morning, a long white road in front, a machine almost a part of oneself beneath one, and all the day one's own.

The Airman and Motor Cyclist.

Aeroplanes are not in the running. Men who fly and who know all about it tell me that all the flying man realises is himself and his engine; the land and water beneath him are but as a big map—he has nothing to do with them whatever.

But the motor cyclist—he is the lucky one. His is everything he passes and sees, the very heart of the country belongs to him. If he does not like it he can speed past, if he does he can linger, loaf, walk, or stop altogether and enjoy it. Between him and the airman there is all the difference between an embodied soul and a disembodied spirit, and, far better than his compeers at the steering wheel, he can enter into the very feel and essence of nature and the joy of life.

The Rule of the Road

USE Pedley Motor Cycle Tyres, Belts, and Accessories, and you can't go wrong!

- ¶ That's my rule—the rule of all who appreciate maximum Comfort and Reliability.
- ¶ Pedley products will help you to get the very best results out of your Motor Cycle.
- ¶ If you're looking for a combination of Efficiency and Economy, Pedley will put you on the right track—and quickly too!

**PEDLEY is the Rule
on every Road.**

J. PEDLEY & SON, LTD., OXFORD WORKS, GREAT CHARLES STREET, BIRMINGHAM.
LONDON ADDRESS: 30, HOLYWELL LANE, GREAT EASTERN STREET, LONDON, E.C. 2.

Aspects and Prospects.—

That is, he *should* be able to; to some people a motor cyclist is but a goggled, belted monstrosity, possibly sucking a cigarette but most certainly looking at nothing but the dust with which he is about to bestrew the world behind him. Which is a notion I am out to disprove and contradict, and, incidentally, I hope to be able to show that the days when a motor cycle was the sole perquisite of the young are over, and that we more stolid and staid young-old ones can fit into it and get the best out of it equally well.

When I began this little essay my idea was to dwell on its undoubted utilitarian advantages, but my pen has absolutely refused to let me dwell on anything

so dull and ordinary. I can assure my readers that nothing was originally further from my thoughts than to find myself rhapsodising on its poetical side, but it seems that I have written what I have written, and that to some there may be sense and meaning in it.

I had so much else to say, too. I might have talked on its saving of petrol and on its economy in tyres. I might have compared its ease and pace with the hard work and monotony of ordinary push-cycling, but all that will do for another time, as also will my accounts and experiences of seeing England from a new aspect.

Also I shall see car motorists from another point of view, and that may charge me with material of quite a new type of sermon.

THE TANKETTE.

A Development of the Motor Scooter which will be offered to the Public in Quantities.

THE question, Why stand? will not be asked by potential purchasers of the Tankette, illustrated on this page, for, although the germ of the idea behind this little vehicle was the scooter, it is provided with a seat, and approximates to the lightweight motor cycle more than to the Auto-ped.

Weighing 135 lb., and measuring 6ft. 5in. over all, the Tankette will be marketed by Messrs. Ronald Trist and Co., Ltd., of Watford, who for many months have experimented with various forms of scooters, commencing with a small toylike machine with wheels 10in. in diameter. Just one step further, and the Tankette would be a lightweight motor cycle; hence it can be regarded more as a competitor of existing light-weights than of the scooter proper.

It is proposed to fit a 2½-3 h.p. two-stroke engine, located at the rear, and driving to a countershaft gear placed before the wheel, and hence back again to the rear hub. This makes the primary drive about 28in. and the secondary drive about 15in. between centres. The frame is constructed of flat steel strips about 1½ × ¾ in., built up so that there are six members parallel at what would be its weakest point. Both front and rear wheels are sprung on leaf springs, the centre of the pivotal rear stays being coincident with the centre of the driving sprocket.

A twin wheel is used at the rear, fitted with two 20 × 1½ in. pneumatic tyres, with a free connection from one to the other, so that on going round curves the air pressure remains constant and the two friction points where the tyres meet the ground are maintained. Both tyres can be pumped from one valve, but, if a puncture occurs, the connecting

cock may be closed and either tyre may be inflated independently. Discs, slightly dished, are used instead of spokes.

We are told that the rear wheel is instantly detachable after removing two nuts. The hub has a hollow spindle, which is used as an oil reservoir for lubricating bearings, chains, and sprockets from one filler.

The countershaft and rear wheel transmission are completely encased, while an undershield protects other parts and the rider from mud splash.

One pedal operates the two-speed gear and free engine device, which consists of a double leather-faced clutch engaging at option either the high or low speed. The countershaft also is hollow, and contains an oil reservoir to lubricate the clutch cone, sprockets, and chain from a single filler. A shock absorber is embodied in the main sprocket on the countershaft.

By driving air through vanes in the rear mudguarding, the back wheel is made to act as a fan.

The designers inform us that the embodiment of side wheel "runners" was decided upon after long consideration, and that they were thought necessary because the machine would be used mostly in towns and suburbs. This arrangement permits of the machine being stopped in traffic with the rider still seated and the engine running idly. A band brake on the high speed chain sprocket clutch drum on the countershaft is embodied, and a tank with a capacity for one and a third gallons of petrol is carried under the pan type seat.

The principal dimensions are as follows: Length over all, 6ft. 5in.; wheelbase, 4ft.; height to top of handle-bars, 3ft. 1in.; to seat, 26in.; platform clearance, 4in.

The Tankette—a link between the scooter and the motor cycle.

Side elevation and plan of the Tankette, shortly to be placed on the market, which will be fitted with 2½-3 h.p. engine and 20 × 1½ in. tyres.

SIMPLY A SOLO SINGLE

Arguments for the Simplest and Lightest Single-cylinder Solo Mount for the Sporting Class of Rider.

MY Army experience did it! During detention my point of view in regard to motor cycles veered round several points. Mixed up as I have been with motor cycles of all kinds, and having perforce to see them handled by riders, both male and female, of all degrees of skill, naturally I have, as a keen rider and a student of design, seen much to provide food for thought. My outstanding impression is that for solo work manufacturers are piling on too much weight. "Nothing new in that," the reader will retort, "since for years past we have had constant pleas for serviceable lightweights." But I am not thinking of weight reduction obtained by reducing the size of the engine. Often as I have watched riders operate their kick-starters, engage the low gear, and glide away on the clutch, a sense of admiration for the various progressive designers who had rendered that sort of thing possible has come over me, but, notwithstanding, I would continually reflect upon the happy and sporting days spent in 1908 to 1910, when "nippy" single-geared $3\frac{1}{2}$ h.p. solo mounts were the rule. Why, the very uncertainty of a successful climb up a single-figure gradient on that type of machine thrilled one. The personal factor in handling the machine came largely into play. As one was dependent entirely upon the tune and handling of the engine, there was a sense of satisfaction in conquering a steep hill that no climb on a variably-geared mount can convey.

Mere Soloists Neglected.

The cry for the double purpose mount for solo and sidecar work has resulted in the creation of a magnificent machine answering that requirement, but obviously a compromise cannot be ideal for one purpose or the other. Mere soloists are not being catered for as they

were years ago, passenger carrying being the vogue in these days.

Do I despise the variably-geared machine? Not a bit, even though its riders will have the laugh of me when I get stuck on a hill. Change-speeders are magnificent, as I have already said, and they are undoubtedly the machines for everyday riders, but there is a class of sporting young rider, agile and keen, who, I know, would cherish a mount on the lines of the 160 lb. $3\frac{1}{2}$ h.p. solo bicycles of ten years ago. So pleasant were my recollections of long runs, including ascents of noted hills—such as Sutton Bank—that I brooded over what a *modern* $3\frac{1}{2}$ h.p. engine should do with its ten years' advancement in design and general efficiency if fitted in a bicycle shorn of a clutch, gear box, chains and chain case, and dynamo. The removal of these items would represent possibly a 100 lb. weight reduction, a considerable relief to any engine, and render the bicycle a thoroughbred indeed. Those broken exhaust valves of olden days can now be cured by the adoption of tungsten or stainless steel, and the second bug-bear of belts pulling through at the fastener never occurs with *modern* belts.

I would risk it, I thought, and experiment, the final consideration being the saving of £25 or so in cost and a reduction in petrol consumption. So I commenced enquiries for a $3\frac{1}{2}$ h.p. T.T. mount of pre-war days, but nothing

attractive coming my way, I laid my troubles before the Triumph Co., and (joy!) my order for a simple single was accepted, the memories of the old enthusiasm for T.T. mounts years ago still being fresh in the manager's memory. I have got the machine—fitted with a 4 h.p. engine, though I would have preferred a modern $3\frac{1}{2}$ h.p. on the score of lightness—and it can be described in a twinkling.

A NEW PATTERN TRIUMPH—A SIMPLE SOLO SINGLE.

The new type 4 h.p. single-geared Triumph illustrated is fitted with a standard decompressor engine of 85 x 97 mm., 550 c.c.

Simply a Solo Single.—

It has a new rear frame, direct belt drive from an adjustable pulley—and that's all! At first I thought of a Philipson governor pulley, but have postponed that idea in the interests of weight reduction. It is merely an engine in a frame. Some will say that this is a retrograde design, but I do not think so, for engine efficiency has made marked advances, and in any case the experiment is fascinating. Those riders who dislike the snatch of a "double" drive should try a plain belt again. That is but one good point to set against the disadvantages of a gearless and clutchless machine. Starting troubles of olden days have, as I imagined, almost disappeared. Thanks to the convenient primer and the decompressor, I can walk beside my machine with the engine firing regularly, and I can turn in the space of an ordinary road without dismounting. This is with a gear of $4\frac{2}{3}$ to 1, on which ratio hills such as Edge and Tysoe are easy work, and Newnham could be ascended faster than the rider can negotiate the top corner. All these gradients are about 1 in 6. In the Lake District or Devonshire the single-gear machine would be napoo, but how many long gradients of 1 in 5 does a rider meet in a year's riding? The acceleration is remarkable. Though I have not been timed, my "walking pace" gear ratio gives me a speed approaching 53 m.p.h.—not so bad.

Engine Snatch on Greasy Surfaces.

It is only when passing over treacherous surfaces that one automatically feels for the clutch lever to cushion the drive. It is bound to be wanted—as well as a gear—many times yet, for I have not sought for freak hills; but to determine the limitations and possibilities of a modern single-cylinder for solo work was partly the object of the experiment. If readers want to know

more I shall be pleased, in the light of extended experience, to record subsequent impressions: but a word to *novices*—a single-gear machine is *not* your ideal. Only if you are experienced and take an interest in keeping your engine in the best of condition, and further if you are nimble, can the essentially sporting single-gear machine make a strong appeal to you.

Specification of a $3\frac{1}{2}$ h.p. Solo Mount.

Had I a works at my disposal, and for the moment ignoring the cost of production, I should have drawn up a specification somewhat as follows for my most simple solo mount:

ENGINE.— 85×88 mm., medium compression, outside flywheel, cast iron liner in an aluminium shroud, as in the B.R. aero engines of Capt. W. O. Bentley's design, but extended to include the top half of the crank case. This would enable one to drop the lower half of the crank case and thus expose the big end, or even remove the connecting rod and piston complete if necessary. Detachable cylinder head, and Ricardo slipper type aluminium piston. Decompressor operated by a convenient toe and heel pedal, as on the Ariel motor bicycle. D.U.

Taking Motor Cycles into Australia.

We have to thank a reader who is a member of the Australian Imperial Forces for the information that anyone returning to Australia may take a motor bicycle with him free of duty, the motor cycle being counted as "personal effects." This only applies to goods which are the *bona-fide* property of the passenger, and are not intended for sale or for a gift or exchange in Australia.

THE SIMPLE SOLO SINGLE IN 1911. (Left) Fred Dover on his $3\frac{1}{2}$ h.p. single-gear Premier, upon which he rode round the coast of Great Britain. (Top) O'Donovan ($3\frac{1}{2}$ h.p. single-gear Singer), who completed 3,000 miles without opening his tool-bag. (Right) W. J. Clarke, ($3\frac{1}{2}$ h.p. Rex), who covered 2,700 miles in six days, June 6th to 11th, 1911.

THE QUESTION OF ACCOMMODATION.

The Third Passenger—
Juvenile and Adult—
on Pillion and in Sidecar.

THE sidecar is frequently referred to as the most economical form of motoring for two. It is also the cheapest means of transport for three persons. This is at least one point where the sidecar scores over the three-wheel runabout for, while it is almost impossible to find room for a third passenger on a cycle car having three wheels, it is comparatively easy to accommodate three adults on a sidecar outfit, and this in a manner much more comfortable for the third passenger than on the average light car fitted with a dickey seat.

On a sidecar outfit it is a simple matter to fix a sprung seat on the carrier for an adult, and many a motor cyclist has travelled thousands of miles with his wife in the sidecar and "grown-up" daughter on the pillion, and, provided due attention is paid to the method of fixing and supporting the seat, there is nothing to be said against the practice. Even the $3\frac{1}{2}$ h.p. outfit is used quite extensively in this manner, though at first sight it appears a somewhat heavy load for a 500 c.c. engine. While three adults on such a machine are not to be recommended, one cannot ignore the argument brought forward by those who find that the popular single $3\frac{1}{2}$ h.p. will do the work. Briefly, the argument is this: a $3\frac{1}{2}$ h.p. outfit weighs approximately 350 lb., three adults approximately 450 lb. more, making a total of 800 lb.

Engines of twice the size frequently are used in cycle cars weighing 900 lb. unladen, and successfully carry three adults who bring the total weight up to 1,350 lb. In addition, the vehicle has four wheels against the sidecar's three, and the effort required to overcome the extra friction of the car type transmission and the extra wind resistance brings up the total load on the engine to quite twice that of a $3\frac{1}{2}$ h.p. carrying three persons. Whether this is a reasonable view to take is an open question. We know that a $3\frac{1}{2}$ h.p. will take three persons, but it means hard work for the engine, which must be detrimental if the outfit be used a great deal in this manner. A 5-6 h.p. twin is the smallest engine which can be expected to give satisfaction if three adults are to be carried.

Inside or Outside the Sidecar?

The majority of owners will prefer to carry the third passenger on a pillion seat, but the alternative method of having a double-seated sidecar is well worth considering. True, the average tandem sidecar is not so pleasing in appearance as the single-seater, but there are good-looking tandems which, attached to a big twin machine, do not look unduly large. There is another two-seated sidecar which has not been seen in this country in any great numbers. This is the sociable sidecar with side-by-side seats. Probably this type is only suitable for the most powerful machines owing to the extra windage of the wider body, but except for this the sociable sidecar has much to commend it.

It is in accommodating the juvenile passenger that the greatest difficulties arise. It is a problem which may be solved for one year and have to be tackled again the next.

That a baby can be carried in the arms of its mother is true, but even a young baby can rob side-carring of most of its pleasures if the sidecar is not roomy. Especially is this so if the mother is not strong, when the strain

Sidecar dickey seat embodied in a Norton sidecar.

The Tan Sad seat for tandem or pillion rider.

ACCOMMODATING THE THIRD PASSENGER.

Hammock for a baby "in arms," to support most of its weight, and a hammock seat for a child a little older.

PREMIER

SUPER RUNABOUT

GOOD APPEARANCE IS ANOTHER STRONG POINT OF THE SUPER RUNABOUT

It appeals to men and women who want a car and do not feel justified in paying the car price. Here, they think, as they turn to watch it speed by, is a vehicle embodying most of the advantages of both sidecar and car — a real stepping stone between the two — clean, cosy, and compact.

If they obtain a catalogue they learn that it is fitted with a water-cooled 8-10 h.p. twin engine, three speeds and reverse shaft and enclosed chain transmission, and 700×80 tyres. Such particulars may convey little to them, but on enquiry their more mechanical friends tell them that it is a sound engineering job, and one they can recommend. Then another couple joins the ranks of motorists to experience the joys of the open road.

Write to-day for advance list.

C.D.C.

The Question of Accommodation.—

of sitting in a cramped position makes a moderately long journey most fatiguing. Therefore, the motor cyclist who contemplates taking his wife and baby with him on his jaunts this year should devise some

Tandem sidecar for adult and child.

means to relieve his wife of the baby's weight. It should be quite an easy matter to make a portable hammock to be slung on the sides of the sidecar.

It is the slightly older child who is so difficult to accommodate; too young to sit on a stool at its mother's knee, and too heavy to be "nursed" for long journeys, probably a hammock seat to take the weight from the mother's lap is the only solution to the problem. When it is a little older a stool before the seat will meet the case, but when the child reaches the age of four the problem has to be tackled more seriously, and probably a larger sidecar will be necessary. The stool is inadequate again; in fact the hammock seat will be found useful in carrying a juvenile inside the sidecar body from all ages until he or she becomes too big for the space available.

At eight—and until the child is a child no longer—proper accommodation has to be provided. If this is to be in the sidecar, then the tandem type must come into use, but there is no reason why the sociable idea should not be considered. Without going to the width of the side-by-side seater for two adults, it should be possible to have on a chassis of conventional type a body of sufficient width to accommodate one adult and a juvenile. A few inches could be spared between sidecar and driver, and on the majority of sidecars there is quite a wide gap between sidecar and wheel which could be utilised to advantage.

If a sociable sidecar on these lines were made it might be found convenient to stagger the seating slightly. Such accommodation would be quite suitable for a boy or girl from eight to twelve years of age, after which the juvenile becomes an adult so far as seating is concerned, and the only means of accommodating her (or him) is on a full-size two-seated sidecar or on a pillion seat.

Sidecars have been produced which have a dickey seat for a child, but it cannot be claimed that they are an unqualified success, for while the baby may be content to go off into the land of dreams—and it almost invariably does when sidecarring—the child old enough to occupy a dickey seat usually desires to see more than the back panel of the sidecar body and the bottoms of hedgerows streaking past in a blur.

To summarise, it should not be a very difficult matter to accommodate the third passenger—juvenile or adult, but certain it is in the former case a large number of motor cyclists do not take the trouble. Let them do this and so make sidecarring a greater pleasure to their passengers, and then there will be fewer

A sociable-seated sidecar fitted to a Harley-Davidson motor cycle.

complaints of cramped quarters. In conclusion, it should be remembered by those who do not occupy the sidecar seat that the larger the sidecar the more comfortable it is, and that it should have a screen to keep off the pressure of the wind, which is not noticed by the man on the saddle.

THE VICTORY CUP TRIAL.

THE first post-war open reliability trial to be held in Great Britain is bound to attract a great deal of interest, therefore the Victory Cup Trial, organised by the Birmingham M.C.C. for Easter Monday, will probably be well supported by Midland competition riders. In addition to medals, the awards will include three cups, *i.e.*, the Victory Cup, presented by Lord Calthorpe for the best performance on any machine; the Duke Cup, presented by R. W. Duke, Esq., for the next best performance; and the Evans Service Cup, presented by P. J. Evans, Esq., for the best performance by a member or ex-member (either sex) of His Majesty's Forces.

The start will be at 9 a.m. from the top of Griffin's Hill, Selly Oak, Birmingham, and the course will be approximately 120 miles, taking in many of the well-known hills in the Malvern and Cotswold districts, and probably including the Old Wyche, Portway, Birdlip, Gamble's Lane (Rising Sun), and Sudeley. The lunch stop will be at Cheltenham.

The schedule has been worked out at 20 m.p.h., and awards will be made on marks. The entries close on Saturday, April 12th, the entry fees being £1 rs. for non-members of B.M.C.C. and 10s. 6d. for members.

The hon. trials secretary is Mr. S. K. Jones, 93, John Bright Street, Birmingham.

A SPRING RUN INTO KENT AND SUSSEX.

Legend and Folklore of Old-world Villages.

By CHARLES G. HARPER.

THERE will be more enjoyment in the opening spring runs of 1919 than many a year has known; and Easter fortunately comes late this year, so that the trees will not be altogether bare, the days will be longer, and—if the spring itself be not unkind—the weather warmer than that of most Easters.

Where, then, shall we go? There is an actual embarrassment of choice, for one can go so far nowadays, and some folk are ambitious. This is not an ambitious tour. It is, indeed, quite a little one, but I think it will be found of interest. We will start from Hyde Park Corner, and, coming out of London by New-Cross, Lee, and Eltham, make, by way of Sidcup and Farningham, for Maidstone. It is an excellent main road, and not likely to be lonely, to say the least of it. The holiday-maker, come back anew to the road after the winter, will probably not want to stop anywhere short of Maidstone, and the broad highway leads him on. Beyond that capital of Kent it is another matter. Maidstone at holiday times does not attract me; nor, indeed, does any considerable town at such seasons. Otherwise I would invite you to inspect the upper floor of the curious old red-brick Town Hall in the High Street, which was once used as a lock-up. On its beams the prisoners have left some quaint records; among them one Davis: "Davis. 3 times here to please his wife." And Davis yet again: "Job wept at Misfortune. Davis smiles. Davis. 1799. 3 months."

A Biddenden cake.

I confess I should like to know something more of Davis: but it may not be!

So we proceed on our way, making for Sutton Valence and Headcorn; now fairly in the midst of Kentish ruralness. At thirteen miles from Maidstone stands Biddenden, whose Easter Monday custom is one of the objects of this little tour. It is one of the several villages known locally and collectively as "the dens," of which Smarden, Bethersden, and Rolvenden are examples. Biddenden, once one of the Kentish cloth-weaving villages, still has some of the old cloth-weavers' cottages to show, and it is in addition a most picturesque and old-world place; almost unique in keeping to this day the original old rough flagstones, quarried locally, which for centuries have paved the footpaths of the village street. Exactly what Biddenden is the accompanying illustration serves to show: an unspoiled community of the Kentish weald. There are the old red-roofed cottages, with two or three inns, and the grey church tower at the further end. Few tourists know Biddenden, but it is locally famous for the "Biddenden Maids," sisters who are reputed to

have lived in the twelfth century, and to have founded the charity which is still oddly celebrated every Easter Monday. Some antiquaries insist that the famous "Maids"

never existed, but that view is not popular in Biddenden itself; and the antiquaries, while (as we think) unreasonably sceptical, do not explain how, if they never had any existence, the charity came into being. The accepted legend tells how Eliza and Mary Chulchurst were twins, born in Siamese twin fashion, joined together at hips and shoulders. Thus they are supposed to have lived thirty-four years; and, when one sister died, the other survived her by only six hours. They died, according to the story, in 1100, and bequeathed "twenty acres, more or less," for the purpose of providing an income by which annually, on Easter Day, the poor of Biddenden were to receive each a loaf and a piece of cheese; and in addition all strangers passing through the village were to have a cake stamped with the effigies of the sisters. No trace of this will has ever been found, nor can the date of the first celebration be traced. In fact, the antiquaries aforesaid consider that the date stamped on the cakes should be "1500," not "1100." The charity has been at least once in danger, notably in 1656, when the then rector of Biddenden, one William Horner, laid claim to the "Bread and Cheese Land," but happily failed. This land now produces some £40 annually. Until 1906 the distribution of bread and cheese took place at the church door after morning service on Easter Sunday, the cakes being handed to all and sundry at the same time. Crowds came with the object of receiving one

The old church, Rye.

Biddenden, an old Kentish cloth weaving village.

A Spring Run into Kent and Sussex.—

of those singular cakes; and the day was changed to Monday, in the hope that not so many people would be able to put in an appearance.

The picturesque ruins of Ore old church.

The bread and cheese distribution is now made at a cottage which was once the old workhouse, half a mile from the village, at ten o'clock in the morning. There are about one hundred recipients of this dole.

The so-called "cakes," of which any stranger may obtain one or two, are desirable rather as curiosities than as edibles. They are made of plain flour and water, and are, in fact, a kind of biscuit, impressed by a wooden stamp with two curious (and ferociously hideous) figures of the legendary sisters.

Old-world Places.

Tenterden, in a further four and a half miles, is one of those old remote and unchanged towns, which look much alike, holidays or no holidays. It is a stately and a likeable place. The most interesting way from it to Rye is by Smallhythe, a tiny hamlet with very picturesque half-timbered houses and the most remarkable toll-gate in England. The gate admits to a privately-owned road, and the tolls are eccentric. Pedestrians pay one farthing, a motor bicycle three-pence.

Rye looms ahead, prominent on its hilltop across the marshes: an old, old town, beloved of artists. There are the old quays, the Ypres Tower, the Mermaid Inn, the cobblestone streets, to tell of what an old seaport was like centuries ago. Rye is quiet, but Winchelsea is dead and buried as a seaport. Once ships came to the haven under the hill, but the sea is now two miles distant, and sheep graze where vessels once rode at anchor.

Eleven miles of a swooping undulating road bring one to Hastings, which the spring tourist, now on the road for the first time after the winter, may like to visit for the invigorating sea air. To me the most interesting part of Hastings is the Old Town, where some quaint streets survive. There, too, is St. Clement's Church, with the old cannon-ball in the upper part of the tower, shot into it by the French or the Dutch at some date unknown. Down on the beach, in the fishermen's quarter, the odd "tackle boxes," where the fisherfolk store their nets and other gear, form a curious survival.

The Return.

We have now come some seventy-three miles. There are two London roads out of Hastings: the new, through Silverhill and Bohemia, and the old, through the Old Town and Ore. Both meet at Baldslow, and both are horribly infested by tramlines. But the old road for preference. Rarely noticed at Ore, away to the left, is Ore old church, roofless and fast going to complete ruin. The sole reason for neglecting it was that the people of Ore new village lusted for a brand new building beside the road.

At Baldslow we leave the tramlines behind, and come up along the main road to London through Battle, too well known to be mentioned in detail. Thence by Robertsbridge and up Silver Hill to Hurst Green and a junction of roads at the approach to Lamberhurst. Instead of proceeding into the village, we turn here to the left, leaving the main road through Tonbridge to London, and make for Tunbridge Wells by Frant, a very good and fast road indeed. The only things to interest the pilgrim in search of the picturesque in Tunbridge Wells are the unique old promenade called "The Pantiles" and the red brick church hard by dedicated to "King Charles the Martyr"—one of the five churches in this country thus honouring the memory of Charles the First. I should like to add that no man knoweth why "Tonbridge" should be spelled with an "o" and "Tunbridge Wells" with a "u."

An interesting way back to London is by Langton Green. Passing the church and then turning right, one comes in two miles to the quiet spot called "Pound's Bridge," with the inn of that name as its chief feature. It bears the date "1593," and was built by one William Darkenall, rector of Penshurst, as a residence. Strange fortune made an inn of it

Tackle boxes at the fishermen's quarters, Hastings

many years ago. Penshurst itself, one of the prettiest villages in Kent, lies ahead; famous for Penshurst Place, the baronial home of the Sidneys. Straight on, to Penshurst railway station and then turning left, a good six miles run follows to Crockenhill, in the midst of the Kentish fruit farming district. Then come Limpsfield and Oxted, followed by Tyler's Green, hard by Godstone. Turning here to the right, and climbing up to Caterham, the way grows suburban to Purley and Croydon. The whole trip comes to 140 miles.

How the Blue Riband of the Motor Cycle World originated, and its Progress up to the Present Time.

THE memory of the public is proverbially short, and perhaps it is not generally known how closely *The Motor Cycle* is connected with the origin of the Tourist Trophy Race. Nor is it fully appreciated how the race has grown from an after-dinner suggestion to the Blue Riband of the whole motor cycle world. To review the famous race is the object of this article, and no doubt it will serve to refresh the memory of our older readers, in addition to placing before new-comers to the sport and pastime a comprehensive history of the classic event.

The first suggestion that such a race as the T.T. would be keenly followed by motor cyclists and benefit the movement was made by the late Mr. H. W. Staner, editor of *The Autocar* and at that time managing editor of *The Motor Cycle*. This was at the A.C.U. dinner in January, 1906, and the very uncertain position of the motor cycle movement at that time (due to daily press attacks) is revealed in the following extracts from Mr. Staner's speech.

A Perpetual Challenge Trophy.

Was he, he asked, at a funeral banquet? It might be so. Motor cycling was dead—at least so said its enemies. . . . Motor cycling was the finest amusement in the world. . . . He hoped that some competition could be arranged for motor cycles on the lines of the car Tourist Trophy. He suggested that the engine dimensions and weight should be limited and that the machine should be fitted with mudguards, brakes, etc., and should be fit to ride as a touring machine.

That a Tourist Trophy race would be held during the next year was announced in *The Motor Cycle* for December 12th, 1906, and in the following issue particulars were given of the trophy, which, it was announced, would be presented by the Marquis de Mouzilly St. Mars—a gentleman who had done an enormous amount of work towards the furtherance of the motor cycle sport and industry. It was presented as a perpetual challenge trophy and the race was to be an international one.

Classifying the Competitors.

The main object of holding the competition was to show that British motor cycles could beat their foreign competitors.

Although the first race was not a consumption trial, each machine was allowed only a certain amount of fuel. There were two classes—singles and twins—and the allowance of petrol for the former was on a basis of 90 m.p.g. and that for the twins 75 m.p.g. Each rider was given an extra pint for leakage and wastage. The course was from St. John's to Ballacraigne, via Creg Willey's Hill to Kirk Michael, and back to the starting point by way of Peel—a distance of 15½ miles, which was covered ten times.

In 1908 the petrol allowance was reduced to a gallon for a hundred miles for the singles and a gallon for eighty miles for the twins. This year no machines were allowed to be fitted with pedals.

In 1907 and 1908 the single and multi-cylindere machines were raced separately, but in subsequent races there was one class only—single and multi-

The Story of the T.T.—

cylindere machines competing against each other, although not exactly on equal terms, the singles being handicapped until 1912, when the capacity limit of 500 c.c. applied to all types of engine.

In 1909 the fuel allowance was abandoned and a cylinder capacity limit imposed, the singles being limited to 500 c.c. and the multi-cylinders to 750 c.c.

In 1910 the single-cylinder capacity limit remained the same, but that of the multi-cylinders was reduced to 670 c.c., while in 1911 the capacity of the multi-cylinder machines was further reduced to 585 c.c.

From the schedule on page 351 it will be seen that in 1907 and 1908 the singles of 431 and 454 c.c. were considerably faster than the twins of 662 and 745 c.c. capacity. That great improvement was deemed to have been made in the latter type is revealed by the reduction of the twin c.c. limit to 670 c.c. in 1910 and 585 c.c. in 1911. The A.C.U. evidently underestimated the advance in twin design, and by the time it realised this and raced all types on equal terms the Scott two-stroke twin had come forward as a speed machine.

1911 saw the first of the Junior races with singles limited to 300 c.c. and twins to 340 c.c., but in 1912 the limit was made 350 c.c. for all types.

In 1911, also, the course was changed from one 155 miles in length to 262½ miles for the Senior and 225 miles for the Junior race. This was the car trophy course, known as the four-inch course, on account of the fact that the engines of the cars using it were limited to a 4in. bore.

Single v. Twin.

In the six Senior races in which singles raced against twins (1909-1914 inclusive), the single-cylinder scored in the last event only, *i.e.*, the Rudge in 1914. In three of these races the twins were given the advantage of increased cubical capacity. Of the three remaining races, in which the two types raced on equal terms as regards cylinder capacity, the Scott two-stroke won twice (1912 and 1913)—hence the net result of the six races was as follows:

585, 670, and 750 c.c. twins *versus* 500 c.c. singles; the two-cylinder won three times. 500 c.c. twins *versus* 500 c.c. singles; two-cylinder two-stroke won twice, one-cylinder four-stroke won once.

Thus it will be seen that a four-stroke twin (V or flat) has not yet succeeded in beating a single of the same capacity.

Highest Average Speeds.

The highest average speed in the Senior T.T. was that of Mr. C. R. Collier (5 h.p. Matchless), the winner in 1910, when the old course was covered at an average speed of 50.6 m.p.h.

In the Junior T.T. the machines have raced on equal terms, excepting in the first of the races in 1911, when the twins were given the advantage of an extra 40 c.c. capacity. The net results give three wins to V twins and one to a single (A.J.S., 1914).

Mr. Eric Williams (A.J.S.), the winner of the last Junior T.T., made the fastest time of the series, Mr. C. Williams (A.J.S.), second in the 1914 race, making second fastest time of the series, the average speeds being 45.6 and 44.7 m.p.h. respectively.

In the earlier races the places were about equally divided between the Triumph and Matchless machines, but after the Indian secured first, second, and third places in 1911, this rivalry became submerged in the brilliant successes of others.

The results given below show that throughout the history of the T.T. race six makes only figured in the first, second, and third positions. This is excluding the multi-cylinder classes of 1907 and 1908.

1907 ... 1.	Matchless.	2.	Triumph.	3.	Triumph.
1908 ... 1.	Triumph.	2.	Matchless.	3.	Triumph.
1909 ... 1.	Matchless.	2.	Indian.	3.	Triumph.
1910 ... 1.	Matchless.	2.	Matchless.	3.	Triumph.
1911 ... 1.	Indian.	2.	Indian.	3.	Indian.
1912 ... 1.	Scott.	2.	Triumph.	3.	Matchless.
1913 ... 1.	Scott.	2.	Rudge.	3.	Indian.
1914 ... 1.	Rudge.	2.	{Sunbeam. Indian.}	3.	Matchless.

Senior T.T. Leaders.

If we count the twin-cylinder classes of 1907 and 1908 and make a total of ten races, it will be seen that it was possible for thirty different makes to figure as first, second, or third in the Senior results. Instead of thirty (or rather thirty-one, because in one race two machines tied for second place), twelve only can be mentioned, and seven of these are only mentioned once. These twelve makes secure the following places:

	First.	Second.	Third.	Total.
Bat	1	—	—	1
Dot	1	—	—	1
F.N.	—	—	1	1
Indian	1	3	2	6
Matchless	3	2	2	7
Norton	1	—	—	1
Rex	—	—	1	1
Rudge	1	1	—	2
Scott	2	—	—	2
Sunbeam	—	1	—	1
Triumph	1	2	4	7
Vindec	—	1	—	1
				31

Junior T.T. Leaders.

Treating the Junior T.T. in a similar manner, we arrive at the following results:

	First.	Second.	Third.	Total.
Douglas (2-cyl.)	1	2	—	3
Forward (2-cyl.)	—	—	2	2
Humber (2-cyl.)	1	—	—	1
Matchless (1-cyl.)	—	1	—	1
N.U.T.-J.A.P. (2-cyl.) ..	1	—	—	1
Ivy-Precision (1-cyl.) ..	—	—	1	1
A.J.S. (1-cyl.)	1	1	—	2
Enfield	—	—	1	1
				12

Thus in four races eight makes secure a place out of a possible twelve, which is a more equal distribution of honours than in the Senior T.T.

The Next T.T.

The next T.T. race is likely to surpass all others on the point of interest. For one reason, there will have been a gap of five years, and most engine designers have learned more during that time than any similar period before. In all probability we shall see a very keen contest between five different types of engine, *i.e.*, the four-stroke singles, V twins and flat twins, and two-stroke singles and twins, and while present-day tendencies appear to indicate that the high-revving flat twin will be prime favourite, it would not surprise us if the single-cylinder type gave the motor cycling world a surprise. The single four-stroke still holds all the 500 c.c. records, and the makers of this type of engine still retain their faith in it, even as a record breaker.

The Blue Riband of Road Events.

The Machine in the Garage

PREPARING FOR THE ROAD.

GIVEN fine weather motor cyclists should have a glorious Easter.

The weather has been so bad in the early part of the year and Easter comes so late in 1919 that we may look forward in pleasurable anticipation to days of sunshine. It will also be an exceptional holiday; the war is over, there is a spirit of freedom about, and it will be enjoyed all the more, because the motor cycle has been denied to so many during recent years. There is only one fly in the ointment, and that is the roads, which, in many places, are not good, but we are better off in this respect in England than elsewhere, and, provided the rough stretches are taken easily, no troubles should be experienced.

Now, troubles are avoided by care in the motor cycle house, and all the time possible should be spent in preparing the machine for the road. The first thing to do is to clean it down thoroughly. Begin with the engine, and, with a good supply of paraffin and brushes, remove oil and road dust until all is scrupulously clean. Special engine cleaning brushes can be obtained from most dealers, but often an old stiff paint brush is better, as it will more easily reach the nooks and crannies where oil and dirt collect, as it is usually not too thick at the end. A cycle cleaning brush of a kind sometimes, we believe, sold as a bottle brush, is very useful. The small flat end is good for cleaning inaccessible places on the engine, and the long narrow part is specially adapted for all other parts of the machine which are difficult to reach. Paraffin is unfortunately expensive, but it is the only convenient medium for removing grease and oil at the present time. There is no need to polish the machine until it is ready for the road, the object of cleaning

being to render the motor bicycle pleasant to work upon, to ensure parts working freely, and to reveal to the owner those defects which are only apparent through careful examination. In the cleaning process the rider is brought into intimate contact with his mount, and, as he proceeds, he comes upon loose nuts, badly working control wire, improperly adjusted tappets, a loose steering head, and other such defects which, if not put right at home, may cause delay or serious trouble, on the road.

If the machine has been stowed away for some time, it is almost certain that, in consequence of months of abominable weather, the magneto rocker arm is stuck up owing to the fibre bush having swelled through damp. The object of this bush is not generally known; it is not for insulating purposes, but it is made of fibre because this is the only suitable material which will allow the rocker arm to work for long without lubrication. Consequently no oil should be placed on the rocker spindle, as it only aggravates the trouble. A piece of emery cloth wrapped round a match and worked through the bush may effect an improvement. The tang of a file may be used in an emergency, but usually it is of too steep a taper. The best method is to use a special reamer made to size. Such a tool was once placed on the market by Simms Motor Units, but was withdrawn as there was apparently no market for it.

A magneto spanner fitted with a fibre bush reamer.

A special tool for opening piston rings.

Now that so many motor bicycles are being taken out of store and being made ready for the road again, it would seem that this simple little device would be especially welcome. It consists of a tiny D-shaped reamer made accurately to size and riveted on to a magneto spanner in the same manner as the gauge usually attached to this tool.

- (1) Cleaning inaccessible parts. A narrow brush is convenient for this purpose. (2) Every part should be examined.
 (3) Using the grinder. Note the pedal cycles hung overhead so as to be out of the way.
 (4) Making a cutter out of an old mowing machine blade. (5) Filling up. The modern motor bicycle has large filler caps and so a good-sized funnel can be used. (6) Ready for the road.

While paying attention to the magneto it is advisable to trim up the platinum points, set them to break .4 mm., and touch up the carbon brush and clean the collector ring. If chain-driven, the tension of the magneto chain should be adjusted when necessary, for a slack chain means late ignition.

The cylinder and piston should be cleaned of carbon and the valves taken out and examined. It is also advisable to wash out the crank case with paraffin and insert at least three charges of oil.

Attention to Valves.

It is almost certain that the exhaust valve will need attention, and if it is in bad condition it is best to take out the "pits" in a lathe by taking a slight skim off the face, or if no lathe is available put the valve in a bench drill, get someone to turn the handle, and hold a piece of emery cloth at the correct angle against the valve face until all trace of pits has disappeared. Then grind the valve on to its seating with grinding compound, and if it is thought necessary to give a very fine finish, complete the job with rouge. If the whole of the grinding is done in the cylinder it is a long and tedious process, resulting in much wear of the seating.

Attention should be paid to the strength of the valve springs, and if weak they should be renewed. The rings should be removed from the piston and replaced

if badly worn, the ring grooves being carefully cleaned at the same time, but if the rings are free they are best left alone. A useful tool can be purchased for opening the rings, after which they may be slid off or on to the piston, or if no special tool is handy they may be removed by placing three slips of tin vertically at equal intervals round the piston, and sliding the rings on these. The novice must remember that piston rings are exceedingly brittle.

The carburetter should be cleaned and the controls carefully examined, and a spot of oil on the Bowden wires where they enter their outer casings is advisable.

When the engine has been reassembled it should be run for a minute on half throttle or less, and then the valve tappets may be adjusted to give a clearance about equal to the thickness of the blue cover of *The Motor Cycle*. A complete overhaul should, of course, include taking down all ball bearings in the bicycle parts, washing them in paraffin, replacing any broken balls, and carefully adjusting the bearings.

To Adjust the Head.

To test the adjustment of the steering head the rider should stand astride the saddle and try to lift the machine by raising the handle-bar grips. It is almost certain that plenty of play will be found, which, of course, should be taken up. This is an important

The Machine in the Garage.—

point which is far too often neglected, and few appreciate that it is advisable to test the head adjustment every few hundred miles. The head is a part of the machine which has to put up with heavy stresses, especially at the present time when so much riding has to be done over rough roads, and neglect means worn ball races or perhaps more serious trouble.

Change-speed Gears.

Now, as regards change-speed gears. The modern countershaft gear box is likely to need little attention save lubrication, but care should be taken that the gears engage properly. In the case of hub gears it is most essential to see that the bracket on which the change-speed lever is mounted is firm, otherwise the gear wheels will not mesh properly and will suffer damage. A useful item in the motor cycle house is a force feed oilcan. This type is vastly superior to the ordinary kind, as it causes the oil to be forced right into the bearing, and is especially valuable in lubricating such points as wheel bearings and spring fork links. The rider should be careful to oil all moving parts such as links, brake rod joints, Bowden control stops, etc.

Next, the tyres having been removed, the rims should be cleaned and painted. It is most unwise

to start a holiday on bad tyres, and great care should be exercised in seeing that both covers and tubes are sound. All nuts should be examined, and last, but not least, the lamps should be overhauled. The best plan when an acetylene generator has been neglected for a long time is to place it and all its parts in a bucket of water and leave them there for an hour or so, then remove all trace of residue by scraping and by the aid of a stiff brush, and dry thoroughly before filling. It is most essential to see that the lamp is clean, the filter should be taken apart, and the gas passages should be clear. Remove the burner and blow it through with a tyre pump.

Accessories and Fittings.

Finally, the motor cyclist should cast an eye over his accessories and fittings, look to his speedometer drive, and see that the pinions are not meshing too deeply, and that the speedometer itself, the horn, mirror, and watch are firmly in place. Then, after a final polish, the motor cycle is ready for the Easter trip. After attention such as is suggested a no-trouble "non-stop" run may be anticipated. Time spent in the motor cycle house is time well spent. It is a splendid cure for brain fog, and well rewards the rider who indulges in this form of relaxation.

AILETTE.

The Principal Motor Cycle Records existing on April 3rd, 1914. (See article on page 324.)

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Advanced Prices.

? I placed an order with a local firm for an 8 h.p. sidecar for 112 guineas. I gave a deposit of £5. I got a letter to say that there was an advance on the price of eight guineas, which I would have to pay. I shall be greatly obliged if you will tell me whether I shall have to pay the extra.—C.J.

Unless your receipt for the £5 states the price to be 112 guineas, we fear you will have a poor case. It is more than likely that the firm in question print their conditions in the catalogue or on a slip attached to their receipts covering this point. If, however, your receipt states definitely the price, and there is no mention made of possible advances, you can hold them to that figure.

Removing the Timing Pinion.

? (1.) I have a 1911 $3\frac{1}{2}$ h.p. Bradbury, which I am overhauling. Will you kindly tell me how to remove the small pinion which drives the timing wheels?
(2.) The valve rocker arms are worn into fairly deep holes, especially the rocker for the exhaust valve. Can this be remedied by putting the little steel tappet adjuster caps over the lower end of the tappet stem? (3.) What is the correct valve setting for this machine? —E.R.W.

(1.) The small pinion is secured by means of a nut. This nut should be removed, and it can then be seen if the pinion is keyed on. If it is keyed it may be withdrawn by the aid of a small tool drawer, obtainable from such firms as Bransom and Kent, 70, Great Eastern Street, London, E.C.2. and Lake and Elliot, Ltd., Albion Works, Braintree, Essex, etc. If, however, it is screwed on it will require a special tool, which the makers may supply, for removing it.
(2.) The tappet adjuster caps would certainly improve matters, but a new rocker arm should be fitted if possible.
(3.) Time the engine in the following way: *Valves*.—Set the exhaust valve to close just after the completion of the exhaust stroke. It will then commence to open when the piston is about one-seventh of the length of the stroke from the bottom of the firing stroke. The inlet should commence to open as the exhaust closes, and remain open for one complete stroke of the piston, or while the flywheels turn through 180°. *Magneto*.—Place the piston exactly on top of the compression stroke, and connect up the magneto with the points just about to break and the ignition lever two-thirds retarded.

A Faulty Mixture.

? I have recently obtained an old Kerry motor cycle, which has an automatic inlet valve and a B. and B. carburetter. It starts up easily with the air closed and the gas about half open, but when I mount the machine and open the throttle to three-quarters and begin to open the air slightly the engine stops. I have put a little tap in the induction pipe, and if I open it slightly the machine gains a little more speed. Can you kindly give me some advice on the matter?—L.E.M.

It looks very much as if you are opening the air too soon. Continue running for a short time before you open the air, that is, until the machine has attained a little speed and has become warmed up, then open the air slightly, giving the engine as much as it will take. If you find the engine runs better with the tap in the induction pipe open, then leave it open, for more air is required.

An ancient L.M.C., which originally had an automatic inlet valve, converted by Mr. R. R. Harris, a Coventry motor cyclist. The cam for the inlet was welded on to the second wheel in the magneto train. Most details of the additions are to be seen in the illustration. The alterations have effected a great improvement in the power of the engine.

Difficult Starting.

? I have a large, low compression, single-cylinder engine on my runabout, which is often difficult to start. The magneto runs at engine speed and is timed to fire just before the top of the compression stroke. Will it be safe and an improvement to adopt the following method of starting up: Shut off the extra air lever of the B. and B. carburetter and lead a small copper pipe connected with the acetylene generator through one of the holes of the fixed air intake; turn on the water and then crank the engine?—J.P.S.

Acetylene is not very reliable in its action, and it would be safer to use a gas jet to enable you to start easily. Just push a piece of rubber pipe from a gas bracket up the fixed air inlet of the carburetter, leaving the throttle and air a little way open, and the engine will start quite easily.

Old Carburetters.

? I have an 8 h.p. J.A.P., and shall be very pleased if you can help me out of my difficulty. The original carburetter was lost, and having an old Triumph carburetter by me (two-barrel type) I have fitted this to the induction pipe, but cannot get the bicycle to run except with the control levers in one position, that is, shut right off. The first time taking the machine out for a test after a complete overhaul it started off at about 25 m.p.h. through the throttle not closing more than half way with the lever in the off position, and the least touch of the air lever increased the speed tremendously, and the only means of keeping down the speed to the above limit was to keep the air lever off and lift the exhaust. I have adjusted the throttle slide to come to the bottom of the barrel, the only position in which I can get a start. Once started, moving either throttle or air levers causes it to misfire and eventually stop (simply misfiring, not blow-backs or popping), so I have only one speed. Variation has to be obtained through the exhaust lifter, which I know you will say is detrimental to the valves.—A.E.S.

There is evidently something wrong with the slides if it will not take extra air—or possibly there is considerable air leakage between the carburetter and the cylinders. Have you tried a larger jet? We cannot suggest anything else without examining the machine or the carburetter, but we should advise you to get a new carburetter.

A Stationary Engine.

? I have bought a single-cylinder, vertical water-cooled motor cycle engine, of 3in. bore \times 3 $\frac{1}{2}$ in. or 3 $\frac{1}{2}$ in. stroke. It has four legs on it, and has been running a workshop. I should like to adapt it for driving a dynamo. (1.) Will this type of engine run for, say, six hours? (2.) What should be the size and weight of an extra outside fly-wheel, to be added for steadier running for the dynamo; also what should be the approximate capacity of the water tank—ten gallons? (3.) At what speed would it be advisable to run the engine continuously—about 1,000-1,200 r.p.m.; and what would be the possible horse-power on gas and paraffin? (4.) How often, approximately, should a pumpful of oil be given, in minutes at, say, full load?—D.B.

(1.) The engine in question would be quite satisfactory if properly cooled. (2.) The flywheel should be about 20 lb., while the water tank should hold at least ten gallons; more, if possible. (3.) About 1,000 r.p.m. On gas or paraffin it would develop about 2 $\frac{1}{2}$ h.p. at 800 to 1,000 r.p.m. (4.) As to how often you should lubricate depends upon the cooling very largely. We should say approximately a pumpful every ten minutes.

Magneto L.T. and H.T.

? Will you be kind enough to inform me how to distinguish a high-tension magneto from a low-tension magneto? We have an internal combustion engine which requires new parts, and even the makers of the engine are not sure whether it is high or low-tension. It has a Bosch magneto, type D.U.2.—CAPT. R.E.

There are two kinds of low-tension magnetos, both of which are distinguishable from the ordinary high-tension type. The older type of low-tension magneto was somewhat similar to the high-tension type in form, but had no contact breaker. The armature, instead of rotating, oscillated, and instead of a contact breaker there was a make and break inside the cylinder of the engine. The later type was more like the modern high-tension magneto, but was supplied with an additional coil which converted the current from a low to a high-tension one. Therefore, it was really a high-tension installation, though the magneto itself produced a low-tension current. The high-tension magneto can be easily distinguished by the wiring, which merely consists of a low-tension switch wire (sometimes not even this) and a high-tension wire to the sparking plug. The magneto referred to is a high-tension one.

Maximum Pressures.

? Will you please let me have some data which will enable me to calculate the maximum pressure resulting from the explosion of a proper mixture of petrol and air, with a given ratio of compression; or can you recommend a book touching on this subject?—A.J.

We are not in a position to furnish you with data for calculating maximum pressures, as such data entirely depend on circumstances, and are taken from the

particular engine under test. Innumerable factors have a bearing on the result, such as suction temperature, valve setting, size of induction pipe, compression pressure, stroke, etc., and over the whole range of the above factors the speed of the engine has a governing effect. We may mention that an average figure for explosion pressures in an internal combustion engine is about 350 lb. per square inch, but, on the other hand, it has to be borne in mind that an explosion of petrol and air in a closed vessel will produce pressures running up to some tons per square inch. There is no book solely devoted to such a subject. You should read a book on internal combustion engine design, particularly those parts dealing with the thermodynamics of the internal combustion engine.

READERS' REPLIES.

Uneven Firing.

Seeing in *The Motor Cycle* of March 13th that a fellow motorist, "J.G.," is having trouble with his 5.6 h.p. Indian with uneven firing, I might state I have a 5.6 h.p. Indian, and had exactly the same trouble, and I could scarcely move with a sidecar, except in low gear; also when solo I could not run slowly, but when going about 30 m.p.h. it was O.K. I think if he gets his magneto looked to it will put paid to all his troubles. I had mine overhauled, and I can now take a sidecar and two passengers without any trouble whatever. If it is of any assistance to our friend I can give him the address to which to send his magneto, where his troubles will be attended to, as mine were. The condenser in my magneto was punctured, and this caused erratic firing. I also had great difficulty in starting, but now I can start from cold in less than six yards.—C. H. BROCKEN.

Chain Bolt Working Loose.

In your issue of the 20th, a complaint is made of fastening pin nut coming loose and falling off, and you suggest that any mechanic will drill a hole through the end of the bolt for a split pin. As this chain was $\frac{1}{2}$ in. \times $\frac{3}{8}$ in. I should say it was no easy task, as these bolts are always hard and necessarily so, too, and, even if this were not so, the pin would be very small to be drilled to take a split pin. The obvious thing to do would be to have a spring coupling, such as Renolds fit. I have always found this to be perfectly reliable on chains up to $\frac{3}{4}$ in., such as the A.J.S. fit. I have been running a Morgan the last two years, and have had no end of trouble with these coupling pins, and I can say it is no light task when the back wheel has to be withdrawn to take two of these out and refit. As for burring over the end with a hammer, that is the last resource I should adopt, as not only is the pin difficult to withdraw on the road, but a new pin and link would be required every time. I have been in correspondence with the Renold firm, and I am informed that they now equip the $\frac{1}{2}$ in. \times $\frac{7}{8}$ in. chains which are fitted on the Morgan with these spring links, and I think it will be a great boon to the riders of those excellent runabouts.—MORGANITE.

RECOMMENDED ROUTES.

BARNESLEY TO LIVERPOOL.—J.H.C.G.

Barnsley, Penistone, Woodhead, Manchester, Eccles, Cadishead, Warrington, Prescott, Liverpool. This route probably involves much traffic and tramlines.

NORWICH TO LEAMINGTON.—M.A.C.

Norwich, Wymondham, Attleborough, Thetford, Barton Mills, Newmarket, Cambridge, Eltisley, Eaton Socon, Bedford, Northampton, Daventry, Southam, Leamington.

UXBRIDGE TO WEST NORWOOD.—B.L.B.

Uxbridge, Southall, Hanwell, Ealing, Acton, Shepherd's Bush, Fulham Park Rd., High Street (Wandsworth), Trinity Rd., Tooting Bec Common, over Streatham Common, West Norwood.

NEWCASTLE TO BLACKPOOL.—W.F.

Newcastle, Durham, Bishop Auckland, Barnard Castle, Bowes, Brough, Kirkby Stephen, Sedburgh, Kirkby Lonsdale, Lancaster, Garstang, Poulton, Blackpool. Approximately 115 miles.

UXBRIDGE TO BEDDINGTON.—B.L.B.

Uxbridge, Southall, Hanwell; after passing the asylum turn right and go across country to Brentford, Kew, Richmond, Petersham, Kingston, Norbiton, Malden, Cheam Common, Cheam, Sutton, Beddington.

COVENTRY TO SOUTH SHIELDS.—J.H.

Coventry, Nuneaton, Atherstone, Ashby-de-la-Zouch, Derby, Ripley, Chesterfield, Sheffield, Barnsley, Wakefield, Leeds, Harewood, Harrogate, Ripley, Ripon, Thirsk, Yarm, Stockton, Easington, Sunderland, South Shields.

CANTERBURY TO COVENTRY.—B.B.

Canterbury, Hockington, Sittingbourne, Chatham, Rochester, Gravesend, Dartford, Crayford, Woolwich, cross river to East Ham, Stratford, Leyton, Walthamstow, Tottenham, Edmonton, New Southgate, Chipping Barnet, St. Albans, Dunstable, Penny Stratford, Stoney Stratford, Towcester, Weedon, Daventry, Dunchurch, Coventry.

MANCHESTER TO LAND'S END.—E.F.

Manchester, Altrincham, Northwich, Tarporley, Whitchurch, Hodnet, Wellington, Bridgnorth, Kidderminster, Worcester, Tewkesbury, Gloucester, Cambridge, Stone, Filton, Bristol, Bedminster, Cross, East Brent, High Bridge, Bridgwater, Taunton, Wellington, Cullompton, Exeter, Okehampton, Lifton, Launceston, Bodmin, Mitchell, Redruth, Camborne, Penzance, Land's End.

EAST GRINSTEAD TO BOVEY TRACEY.—W.L.F.

East Grinstead, Felbridge, Burstow, Reigate, Dorking, Gomshall, Newlands Corner, Merrow, Guildford, Hog's Back, Farnham, Odiham, Basingstoke, Worting, Overton, Whitechurch, Andover, Weighill, Thruxton, Amesbury, Stonehenge, Depton, Wylve, Hindon, Mere, Bourton, Wincanton, Sparkford, Ilchester, Ilminster, Chard, Yarcombe, Monkton, Honiton, Exeter, Alphington, Chudleigh, Bovey Tracey. Distance approximately 180 miles.

Sidecar Brakes.

OF the many machines designed as sidecar outfits, very few have embodied a brake on the sidecar wheel, and the 1919 model of a leading make upon which this was a feature before the war is now being re-introduced without it.

With the tendency for sidecars to be heavier as refinement after refinement is added, the necessity to equip the sidecar wheel with a brake appears to be obvious, especially when the average front wheel brake does not give the service it should.

It would appear that comparatively few experiments have been made by manufacturers, and, if the matter has been given consideration at all, the question has been dismissed as being one fraught with many difficulties. By others it is thought that, if one rear wheel brake is sufficient to hold a machine on a hill, the increased cost of production of the sidecar brake is not justified. This rather appears to be narrowing the margin of safety, as, if the back wheel brake fails to function, the driver has not complete control of the machine.

It is certain that a really satisfactory sidecar brake has yet to be evolved, and, although our own experience with sidecar brakes has been far from encouraging, we see no reason why a successful design should not be forthcoming if designers will give the matter proper attention.

We think one of the mistakes of the past has been the practice of having separate controls to the brakes on sidecar and back wheel, and also in so placing the lever that the former could be operated by the passenger. From actual experience we know it is most undesirable to permit the passenger to use the brake, as the least pressure upon the lever, if unexpected, instantly causes the machine to swerve to the left.

It is clear that for a sidecar brake to be successful it must be interconnected with the rear wheel brake, and that it must have a

balancing or compensating action, and an easy and accurate means of adjustment. Perhaps it may be found beneficial so to adjust the brakes that more pressure is applied on the rear wheel of the cycle than on the sidecar wheel.

Spare Parts.

IT may be admitted that the motor cycle manufacturer, like many another, is meeting with difficulties in his endeavour to satisfy all who ride his machines. The reasons are well-known to all, and need not be enumerated in detail. There is one point to which it seems to us, however, that rather more attention should be given, and that is the prompt supply of spare parts. We have had, of late, sundry complaints from our readers of failure to supply some small part or other which is actually in stock at the moment. Annoyance has also been caused by the despatch, after about a week's delay, of a *pro forma* invoice, followed later, after the money has been forwarded, by the information that the required part is not in stock and cannot be manufactured.

One correspondent, writing under the spur of some irritation, points out that a manufacturer's responsibility does not cease with the sale of a motor cycle. "A machine," he says, "may be the fastest, cleanest, lightest, handiest, most powerful, cheapest, quietest, and best climber in the whole wide world, but when it stands idle for the six finest weeks in the whole year, waiting for a fork spring or some other trivial but vital part, it is not one-tenth part as fast as $1\frac{1}{4}$ h.p. Dinkie, nor so satisfactory, and the owner will never buy another, and he will take care to spread the news among his friends, and will eventually sell the machine to his enemy."

It cannot be denied that there is justice in this complaint, but happily it is exceptional. It should be remembered that the prompt supply of spare parts will go a long way towards securing the order for next year's machine.

A FOOT-CONTROLLED THROTTLE.

A Device of Particular Interest to Those who have Lost an Arm.

SOME time ago, after a little experimenting, I constructed a successful combined hand and foot-operated throttle on my Lea-Francis motor cycle, and it may interest others who are thinking along similar lines to hear how this was carried out.

Necessarily, the method of procedure at the carburettor must vary slightly with different makes of carburetters. Although the Binks three-jet was the one to which this description applies, no doubt similar construction with slight modification would apply to other makes.

The first thing to be done was to lift the throttle by two independent Bowden wires, the sketch (fig. 1) showing how this was accomplished.

The original Bowden wire was removed from the throttle and a $\frac{1}{4}$ in. diameter brass rod substituted, with a small collar soldered to the bottom end to hold it in the throttle. To the other end was soldered a rectangular brass cross-head, drilled on either side with $\frac{1}{8}$ in. diameter holes to take the two Bowden wires from the hand and the foot controls. Over this, and soldered to the screwed cap of the throttle barrel, is a U-shaped piece of brass, serving as a guide for the cross-head and holding the outer Bowden cables at the top, the inner cables passing through two $\frac{1}{8}$ in. diameter holes. The inner cables have two small brass nipples soldered on in the usual way, after they have been passed through the cross-head. One cable is then led to the handle-bar, the other over the top of the tank and down to the right-hand

The pedal control fitted to the footboard.

footboard for the hand and the foot control respectively.

Fig. 2 shows the lever or accelerator pedal, as it would be called, on a car—fitted on the end of the footboard to the right of the brake pedal.

This was easily built up from $\frac{3}{4}$ in. square mild steel rod by acetylene welding. The vertical pillar was first welded to the base plate, then the horizontal piece to the top of this again. The

lever itself is a piece of the same material pivoted, by a $\frac{1}{4}$ in. Whit. bolt, to the vertical pillar, and held up to the adjusting screw by a flat spring. Two small steel screws hold the spring to the underside of the lever, after the

Showing how the throttle is lifted by two independent Bowden wires.

Bowden wire is passed through, on which is the usual nipple. Adjustment is carried out by the set screw and lock-nut shown.

It will be noticed that the extra air lever is not interfered with in any way, but, as a matter of fact, on this machine it is rarely used, the carburettor being quite automatic.

A little practice is required at first to get the "touch" of the pedal, but when this is overcome the machine can be controlled very easily, and the brake and clutch pedals of the Lea-Francis

Fig. 2.

being right and left respectively, the control is exactly like a car. Of course, more accurate control can be obtained with a sidecar fitted, but even solo I find it very useful.

This system might be very useful to a motor cyclist who has been so unfortunate as to have lost the use of an arm or hand, as it would enable him to dispense with the hand control altogether.

I have been riding with the fitment mentioned for several thousand miles, and would not care to be without it, and although the hand control is always ready for use if required, I consider it has been well worth the energy and time expended on fitting. R.

THE M.A.C. SPARKING PLUG.

A SPARKING plug embodying one or two unusual features is the M.A.C., manufactured by the Mechanical Accessories Co., Oak Street Works, Preston, Lancashire. The central electrode is made of nickel steel $\frac{1}{16}$ in. thick with a shoulder $\frac{5}{16}$ in. thick. The insulator consists of some 280 mica washers compressed tightly together, the whole of the mica being held in position by a small brass ring and washer, and cannot be moved. This insulator is turned to a standard size so as to fit the thimble, which is turned out of the solid brass with a shoulder to fit the bottom body made with a taper thread

The M.A.C. sparking plug.

so as to form a perfectly gastight joint. The electrodes, made out of $\frac{1}{16}$ in. nickel steel, are spun on the bottom of the thimble, and are easily cleaned inside and outside after unscrewing the thimble from the bottom body. A brush is supplied with these plugs for this purpose. The bottom body is made out of solid brass, and need never be removed after once being put into the engine, as the thimble portion is the only part necessary to be taken out to be cleaned. The top body is also made of brass, and screws with a taper thread on the top of the thimble, binding the insulator, and making the whole plug gastight. The adjustment of the spark gap is effected in a somewhat novel manner. The central electrode is slightly bent, so that, by loosening the thimble, the central electrode may be turned and placed in the most suitable position.

Occasional
Comments

The Ratios of a Four-speed Gear Box.

THERE has been much discussion lately as to the merits of four-speed gear boxes as a class and as to the plotting of their ratios. Some enthusiasts hold that the ideal box should have a couple of close-set top ratios—e.g., $3\frac{3}{4}$ and $4\frac{1}{2}$ to 1—the former being used under easy conditions: e.g., speed bursts, gentle slopes, or with a following wind. Apart from the difficulty of securing two direct drives, such a series is fallacious. A $4\frac{1}{2}$ top is perfectly satisfactory, and the rider who possesses both will never be quite sure which is engaged unless he is extremely familiar with his machine or glances down at his gear lever. To my mind the sole justification of a four-speed box is the provision of a very low emergency ratio, running well into double figures. Whilst one cannot pretend that a 12 or 15 to 1 ratio is ever a necessity, it is occasionally a convenience. It permits you to dodge through a flock of sheep on the trough of Sutton Bank; it is handy in any freak climbing stunts you may be disposed to tackle; it facilitates starting from rest on severe inclines; it enables a small engine to pull a sidecar up any hill; and, last but not least, it is indispensable to many Overseas riders, who have to use tracks which are really unfit for motors. Thus for home use no machine need be “crabbed” because it has only three speeds: but the manufacturer who can crowd in an extra ratio without extra charge deserves every encouragement, and will certainly receive it from the export trade.

The Size of Petrol Tanks.

THE capacity of a petrol tank is usually dictated by one of two considerations. Some manufacturers think out their frame dimensions and stick in the largest tank which can be accommodated and will look presentable. Others make a great talking point of the fact that their tanks hold exactly two gallons, the presumption being that it is the correct size for taking an entire can, whilst it is implied that surly garages will not supply less than a whole can, which is often true. Unfortunately, our tanks run dry—if we are careless—miles from a garage, but if we are careful we fill up before the tank is empty, and so the fact that an empty tank will take two gallons is of no value whatever. Every practical rider knows that garages dislike “splitting a can,” partly because few cans contain full measure, partly because spilling and evaporation cause losses when a can is split, partly because customers dislike buying from a can which was opened before their arrival. It follows that the ideal tank capacity is not two gallons, but *two gallons plus a reserve* sufficient to propel the machine ten or twenty

miles—say $2\frac{1}{4}$ gallons in all. This tank is by no means cumbrous or unsightly on machines of 500 c.c. or over, nor even on small machines which possess scientific lubrication systems. If the reserve quarter gallon is tapable only by varying the setting of a three-way petrol tap, we could all blaze happily along till the engine began to spit, then put the petrol cock in No. 3 position, and buy a whole can of spirit at the next garage. Under the existing practice we have to take a precautionary peep at the tank every few miles, and then face a *fracas* with a surly garage hand. The remedy for both troubles is so simple that it should be applied to all large machines.

Another Puzzle.

EQUALLY mysterious is the protracted survival of a variety of obstacles to the withdrawal of wheels. Since Woodgate Bros., Surridge, and other vendors of quick-drying and tenacious solutions came to our rescue, we do not take our wheels out of the frame with such frequency as was forced upon the pioneer riders. Still, they have to come out sometimes, and even in this year of grace it is often quite a job to disengage them. I am not thinking of such snags as front wheel brakes, or chain cases: the difficulties which I have in mind often outlive knock-out spindles and other patented devices for making wheels detachable. One snag is the mudguard, which—whether of the front or back variety—is quite likely to foul the wheel when you are entering it into the forks, unless the machine is raised far higher than the makers' stands can lift it, unless some such common-sense device as the Rudge hinged guard is fitted. Another snag is the downward pointing eye in some fork ends. At any rate, the presence of a friend to hoike the machine a few inches higher than the stand can manage is often of vast assistance in replacing a wheel. Here, too, the remedy is obvious.

An Expensive Toy.

I HAVE always found it difficult to take the motor scooter seriously, but you can never say what is going to happen when society people unearth a new fad. The picture papers put a camera man in waiting; then the universe begins to gossip, and the toy has gone into mass production before you have time to look round. The motor scooter has hesitated for some time between remaining a roller skate or expanding into a lightweight motor bicycle. At the moment it is coquetting with the more ambitious alternative. It has certain obvious advantages over, say, a Baby Levis or Triumph. It costs some £20 less at a time when cash is distinctly shy. It dodges the odium attached to pukka motor cycles in the eyes of the smart set. If it goes wrong, you can tuck it under

Occasional Comments.—

your arm or put it in a cab. In some parts of the country the police apparently permit it to curvet on the pavement. On the other hand, it can never, never be used for touring in its original form, and is unlikely to commend itself for trips exceeding five miles at the outside. My own verdict is that the scooter cannot stay where it is. It may ultimately shrink back to its original dimensions, and revert to being a sort of pocket motor bicycle for shopping purposes: or it may swell out into a form indistinguishable from the cheaper lightweights. In road practice, of course, the snag of these lilliputs is that at the best you have no power to spare, and tune is seldom well maintained. Consequently, their usefulness is strictly limited, and unusually dependent upon the owner's skill. The real novelty of the motor scooter, as compared with lightweights, is that it presents itself frankly as a boulevard runabout and nothing more: it has no Land's End-John-o'-Groat's nonsense about it. Will many people pay £20-£30 for it at that? Well, it is certainly nice to be independent of trams, tubes, and taxis within a five-mile range; and that is what the scooter offers us. Except as a fashionable novelty it will not tickle the people who whistle for a taxi on the slightest occasion; and you can do a lot of tram and tube transport for £30.

The Ultra-cheap Machine.

VARIOUS designers, manufacturers, and would-be riders have taken interest in my occasional mentions of the great demand for a very cheap motor bicycle. It seems quite clear from their opinions that those impecunious riders who would make the backbone of this new market will accept almost any machine of 500 c.c. which is cheap, reliable, and fairly comfortable. They will not be fastidious about the transmission—belts not objected to—or the artistic hues of the tank enamel, or the glitter of the plating. But it must be able to pull a sidecar, and should be tolerably fast as a solo mount; they do not want under-powered and dithery lightweights. Quite a number of firms are feeling their way in the desired direction, and all of them are up against one or more snags. For example, one concern

has worked out extremely economical methods of constructing the frame, tanks, guards, etc., but cannot hit on any method of evolving a sufficiently cheap engine. Another firm wants to knock £1 off the cost of the wheels, £2 off the ignition, £1 off the carburetter, and so on. In other words, an engineer may see his way to cheapen the component parts for the design of which he is personally responsible, but the saving on these is inadequate unless it is balanced by corresponding reductions in the price of parts which are made by other firms.

Some Side-Lights.

UNQUESTIONABLY the best prospect of, say, a £40 touring machine in 1920, ultimately reducible—as our finances stabilise—to £30 or £25, would come if a small group of specialists tackled the whole problem of design anew from stem to stern, as Ford did when he planned his car. In the meantime it is clear that this job cannot be half done. The “class” singles command £85 at the present minute; a simplified single at, say, £65 is hardly worth the making, but a simplified single at £40 would be as big a stunt as the Ford car. Before such a machine can be born, various specialists must break soil which is almost virgin. We can never get the £40 machine so long as we incorporate magnetos at £5, carburetters at 50s., and so on. It will not have hand-built wire wheels, but pressed metal wheels without wind-catching webs or discs. Its erection will not include the bolting into place of innumerable tiny gadgets, each of which is a separate job. This machine can be made, and will be made. At the moment it waits principally for:

1. A cheap engine.
2. A cheap ignition.
3. A cheap carburetter.
4. A cheap wheel.

No. 1 implies a two-stroke or outside flywheel four-stroke. No. 2 demands something absolutely novel—perhaps a fixed firing point and a catalytic plug, or some such weird gadget. No. 3 might be managed by aluminium die casting, seeing how absurdly simple motor cycle carburetters are. No. 4 is not promising. Disc wheels in quantity might be cheap, but are unpleasant to ride under certain conditions: pressed steel artillery wheels are too stiff and too heavy. Nothing will happen till we get a big, wise firm genuinely interested; at present small outputs *de luxe* captivate all our manufacturers, and the handful who dream of big markets look Overseas to find them, ignoring the giant markets outside their own gates.

A sidecar produced by an American firm, and so designed that it may be separated into flat sections to facilitate compact packing for export trade.

IN THE FUEL WORLD.

A New Process showing
Great Promise.

FOR years the British motor industry has been deeply concerned over the supply of those fuels on which it is primarily dependent for its existence. Thirteen years ago, complaints of the high cost of petrol were rife, and experiments were conducted with alcohol, which, mixed with benzole, is an excellent fuel for petrol engines, but, although the trade and many private motorists saw the possibilities of the fuel, the Government either could or would not. And so, as a result of Excise restrictions, alcohol was effectively and permanently barred.

Benzole was the next palliative, and in 1913, when the price of petrol had risen to the unprecedented figure of 1s. 6d. per gallon, a certain amount of the home-produced coal product was on the market at a few pence cheaper. All motorists liked it—in fact they could do nothing else—but the benzole producers found a better market abroad, and most of the English-produced benzole went to Germany, where it developed the great dye industry and contributed to the accumulation of huge stocks of explosives!

A Promising Process.

The Del Monte process came next, and no one seems to know clearly why this gradually fell into oblivion, for its prospects were quite rosy. It was a thoroughly commercial proposition for the production of cheap motor fuel, and, if the truth ever becomes known, it may appear that the petrol combine was at the back of its early demise.

Then came the great upheaval of 1914, and with it the immediate disappearance of benzole from the market. The Government wanted all the benzenes it could get for the manufacture of explosives, and in some quarters it is believed that the war showed the Government the folly of its indifference to the long continued export of English benzole to Hunland. Petrol began to soar in price at an alarming pace, and a rationing system was introduced that added another sixpence a gallon, and ultimately had the effect of making motoring impossible to any but those who were directly engaged on "work of national importance," as the phrase went.

Now that the war is over, the authorities admit the real national importance of a home-produced fuel for road transport vehicles, and they are encouraging all enterprises that hold forth any serious promise of success. An experiment with alcohol is being conducted on London buses, and, if it is a success, it may be hoped that some relaxation of Excise restrictions will result, so that the artificially inflated cost of alcohol will undergo useful modification.

The Greenstreet Process.

A process that is entirely new to this country may be expected to fructify in the course of the next few months, and if it does the effect on the fuel situation as a whole should be considerable. Mr. Greenstreet has had working in America for some years his patent process for the conversion of heavy hydrocarbons into the lighter members of the same series, and also for the removal of all sulphur from fuels that have hitherto been unusable in internal combustion engines on account of their too great sulphur content, sulphur being injurious to both valves and cylinders.

From crude petroleum oil the process will obtain about 65% more motor spirit than has previously been possible, and the same holds true of its use with shale and coal tar oils. From substances as dissimilar as peat, sawdust, and coal tar by-products, a motor spirit of first-class quality has been obtained, and a useful feature of the process is that the boiling point of the resultant fuel can be controlled. In other words, the process will give a fuel to satisfy any reasonable stated requirements.

Peat is widely distributed in the British Isles and in other parts of the Empire, and great hopes are being centred in the promise of the Newfoundland peat fields.

The keynote of the process is high temperature intensive recovery, and reports on its working by experts whose opinions may be accepted with respect would appear to justify the claims that are made. Oil that has been discarded by the ordinary petroleum distillers as containing no more motor spirit—*i.e.*, crude oil from which the lighter members have all been extracted by methods in ordinary use—have been made to give a yield of as much as 40% of first-class motor spirit! The plant is comparatively simple and cheap, and can be erected almost entirely from materials which are likely to be in stock.

Expert Opinion.

Sir Boverton Redwood is a petroleum expert who has occupied a most important Government position with regard to fuels during the war, and upon his words unquestioned reliance may be set. His opinion of the Greenstreet process is that if it had been working and fully established in England before the war started we should have been *entirely independent of foreign imported fuels!* Negotiations for the full exploitation of the process in the whole of the British Empire are being conducted, and there should be further interesting developments to be recorded in the course of the next few months.

ADAPTING OLD CLOTHES FOR MOTOR CYCLE WEAR.

WITH the advent of spring, we of the weaker sex always give much thought to the suitability, or otherwise, of various types of dress. I remember seeing in the motoring press recently photographs of an American lady rider wearing a low V-necked blouse. This is unpractical and dangerous to health. To ride in such would be at least courting pneumonia, but, as I said before, the photographs were American, and funny things are done "over the water." After all, one can ride in unsuitable dress if one is so inclined. A footballer could play in evening dress. One must use one's own discretion; nothing teaches so well as experience, but the following ideas may assist the dubious.

The Question of Cost.

A friend of mine who rides a $2\frac{3}{4}$ h.p. Douglas in most weathers fancied a leather coat, but found that the price had soared since 1914 from a modest six guineas to fifteen, so this was ruled out and a substitute adopted. A quantity of washleather was bought and sewn inside an ordinary last season's long tweed coat; this method of lining was carried down each of the sleeves and found to be quite a success and completely windproof. This is a suggestion that anyone can carry out with time and patience, and, consequently, there is no need to resort to a tailor.

Woollen Coats.

Woollen coats are occasionally recommended. These might suffice on a warm day when pottering from street to street on a shopping expedition, but for real riding or touring are taboo. I ask any reader to recall walking in a woollen coat on a windy day; the open

texture is little protection, and one becomes miserably cold and uncomfortable.

Half-yard Remnant for a Cap.

The illustrations of the driver of the 4 h.p. Douglas combination show, I consider, a most practical "get up," and yet one can scarcely call it dowdy unless one is trying to be uncharitable. The tammie of tartan was made by the wearer from a half-yard remnant, and when pinned at the side it has the virtue of "sticking on." The Norfolk costume is durable, and can be covered in extreme cold by the long coat which at other times reposes in the capacious locker that is part of the Douglas sidecar. The scarf was also "home-made," and is equal to the usual shop variety. It is made of woollen material, worked round the edge with a blanket stitch and finished with squares at both ends in a purple wool. Gloves with fur backs are preferable to fur-lined, being as warm as most, but it stands to commonsense that if one motors in wet and cold long enough no gloves can entirely eliminate all physical discomforts. For summer wear a pair of double-lined woven gloves, which cost 1s. 11½d. at a village store, give much service. Spats are good wear for the legs, these being very easily put on.

When sufficiently clad, motor cycling is most enjoyable, but under bad weather conditions mackintosh and oilskin are the only possible wear. Meeting rain at twenty miles an hour will saturate any but the most impenetrable garments, and the lady motor cyclist will add to her comfort if she carries in the sidecar an "oily" and sou'-wester.

Miss Maud Dunham and her Douglas outfit. The upper photograph shows her clad for warm weather riding, and the lower in neat attire for winter time.

LONG SERVICE.

There is no necessity to quote exceptional cases of B.S.A. longevity, there are thousands of B.S.A. riders everywhere who, from personal experience, can testify to the remarkably long service which B.S.A. machines give. Year after year B.S.A. Motor Bicycles are giving invaluable service, frequently under the most arduous conditions, and with unfailing reliability. Freedom from worry and a saving of expense are two important advantages which have been largely responsible for the great popularity of B.S.A. machines.

THE BIRMINGHAM SMALL ARMS COMPANY LTD.,
47, Small Heath, BIRMINGHAM.

PREMIER

AT THE TOP OF THE HILL.

That is where the efficiency of THE SUPER RUNABOUT is revealed. To be able to climb and to go on climbing, is one of the real joys of touring. On a Premier Super Runabout you can tour without anxiety, without fear of stalling or overheating on these long steep mountain hills from which the most magnificent views are obtained. And on descending you will know that the Premier brakes are efficient and will hold the Runabout on any grade. The Premier Runabout is an ideal Touring vehicle, it is roomy, it has ample space for the accommodation of luggage, and a fuel tank holding five gallons. Write to-day for the advance list which gives details of specifications.

Evolving a Motor Cycle from First Principles.

A Machine of Unorthodox Design embodying Aluminium Frames and Forks.

By MAJ. C. B. WATERLOW, R.A.S.C., M.T.

TO anyone returning from the uttermost parts of the earth, it is strange and delightful to pick up once more the threads of the old world, not the least interesting part of which is "the motor cycle world." "The blue" from which I am now returning has been of such an exceptionally cerulean hue that neither letters nor journals were able to reach me for the best part of a year. Therefore, I approach

Fig. 1.—A motor cycle designed by the author from first principles. The frame also forms the crank case for a four-cylinder horizontally-opposed engine, two cylinders being mounted on either side. Rear springing may be incorporated also. For ladies' use the tie rod may be removed and the rear part triangulated.

once more the subject of the motor bicycle, its potentialities and future, almost as a visitor from another world, and in writing this article I am trying to imagine that the existence of push bicycles is unknown to me, so as to approach the question in the same way as one might, for example, tackle such a problem as "how to extract locked energy from the atoms," almost without reference to precedent or guiding formula of any kind.

The problem in this case is, "how to make a two-wheeled self-propelled vehicle that shall be as 'good' as possible in every way," and the latter part of the proposition needs so much amplification and definition that I shall content myself by endeavouring to describe my own particular ideals.

Following out this imaginary process of evolution without reference to precedent or example of any kind, I shall first of all discover that it is possible and easy to ride a two-wheeled vehicle, probably by trying it down a hill after the manner in which the Wright Bros. started their gliding experiments. Then I should have to think out the best means of connecting the two wheels together and of locating my source of power. Now the example of the brazed tubular steel frame would not be before me, and this structure, with its almost glass-like rigidity and fearfully unequal distributions of stress and strain, would not stand the slightest chance with me. At this point, many readers will call to mind the Brown Midget Bicar of the earlier days of motor cycling; but, excellent though Mr. Brown's endeavour undoubtedly was, it did not resemble very closely the frame (provisionally protected) which I illustrate in fig. 1.

A famous scientist of the automobile engineering world once remarked to me on seeing my motor

bicycle, a standard roadster of 1910, that it looked to him like an animal which kept all its vital organs outside instead of inside. My frame (fig. 1) has one principal member A, which is a kind of large breast-bone containing the crank chamber, cylinder beds, etc., as well as the steering head. To this principal member, which is preferably cast in some suitable alloy of aluminium, and which may be very light, are attached the other two main members, struts for the seat and the rear wheel respectively; a light tie bar, which also may be a continuation of the steel hawser or wires E, makes of the beam B a rigid structure with the principal member A. The duplicated adjustable steel hawser E maintains the whole in position, the seat strut C being adjustable for convenience of position about the pivot at its lower end, the adjustment being secured by lock nuts or set screws or other convenient means.

It will be seen at once that I have burdened myself with very few parts, and comparatively little work in making and assembling them, whilst I can easily so form my struts and ties as to get the most even distribution of stress, and so can reduce the weight out of all proportion to that of the brazed steel tubular frames that we know.

Having satisfied myself on the question of the main connection between the two wheels I must next think out my source of power from first principles. I have already indicated part of the conclusions to which I came by saying and showing that I propose to cast crank case and cylinder beds in one with the frame member A, so I may as well say at once that I arrive at a small four-cylinder horizontally-opposed four-stroke, air-cooled, with outside flywheels, further details of which I must for the present withhold. As regards its having four direct acting cylinders working on the Otto cycle—which, of course, I have to discover independently! — I soon find out that this is the smallest number

Fig. 2.—A cast aluminium alloy spring fork design by Major C. B. Waterlow.

of cylinders that will give me a semblance of continuous torque at all speeds, and, since I must have comfort as an essential part of the "goodness" of my machine, I must have at least four cylinders, which are attached to the crank case at D. I might have six or more, you say. Yes, but I cannot see my way to arrange them "conveniently" without sacrificing more "goodness" than I gain by the increased

Evolving a Motor Cycle from First Principles.—

number. Having generated my power I must find out how to transmit it. I see at once that there are many ways of doing this, that it need not even be done through one or other or both of the wheels, fan propellers being a possibility. However, I decide eventually upon the back wheel as being more consistent with that "goodness" that I have set out to seek; and I then puzzle my brains about how to get my power in suitable ratios from the engine to this wheel.

The Gear Box.

Here, in the real world, as distinct from the world of imagination in which I am at present wandering, a very interesting point crops up. The early motor bicycle manufacturers had the precedents both of chain and shaft drive on push bicycles, yet, for the most part, they chose neither, but painfully evolved belt transmission, following rather the example of power distribution in shops. Now, in these latter days, they are largely reverting to the chains that they cast off at first. This state of affairs sets one thinking: it tends to show that there is plenty of life in our engineering industries.

I decide on chain transmission *via* a countershaft gear box, and this box gives me much trouble. Of course, I knew nothing of the Frenchman who said of the early Panhard "crash" gear box, "*C'est crude et brutale, mais elle marche*": *elle marche*, "it goes," was the essential feature, the others were subordinate. However, I do not think that I, as a visitor from another world, could stand the crash: my gears would be always in mesh and would be brought in and out of action frictionally. Again, as a visitor from another planet, I should shy most emphatically at the sidcar: I could not possibly understand it, because it is a thing—a travesty of mechanics—that a close consideration of first principles could never evolve. Therefore, with my four-cylinder engine of fully six horsepower, I should only want two speeds. Therefore, my gear box would be a very dainty affair.

Having reached the rear axle, I see that I have still got to arrive at the road, and I say unhesitatingly that the tensioned wire wheel is the only thing consistent with the "goodness" of my machine.

I very soon discover from first principles and other things that I must have springing. In fig. 2, I show a form of spring fork similar in principle to one that I patented in those dim, distant pre-war days and that

others have again since patented, in so far as I can see all infringing both myself and each other. The fork that I show (also again provisionally protected) has the advantage of keeping the leaf spring—evolved from first principles—out of wet and dirt. The main fork member, which should preferably be of cast aluminium alloy, is carried in the usual manner on two pairs of links. Here, however, the similarity to general practice ceases, for the lower pair of links is extended to the rear (see small sketch), and carries a laminated spring, which follows approximately the line of the mudguard. The lower end of this spring is connected to the hub by two light struts which are normally in compression. These struts may be made to support the mudguard, but, if so, the latter must not be rigidly attached to the main fork member.

Now in order to correct the appearance referred to above as "carrying the vital organs outside"—look at any modern American machine with all its equipment on, and you will see the force of the illustration—I resuscitate a feature which seems to have disappeared, namely, windscoops for the engine. There are also other cooling arrangements provided, details of which I must withhold for the present.

The first principles of my own anatomy demand an extremely comfortable seat, footboards, and handlebars, and over the evolution of these I have little difficulty, most human achievements being made under the stimulus of pain!

Moonshine?

If this article succeeds in making its readers think thoughts that are in any way new, it achieves its purpose. I am, of course, well aware that there is "nothing new under the sun," but under the moon there may be: and I am being invalided home from Mesopotamia as a "mental case." Therefore, in the pale moonlight of thought in which I am officially supposed to be wandering, I may have touched a little of that magic of true novelty that does not appear in the daylight.

Coming out into the sunlight once more—not the sunlight of Mesopotamia: Oh, never that again, I beg!—I should like to conclude these remarks by reminding my readers that motor cycle manufacture is the only branch of the motor industry in which we British really lead the world. Let us all do everything we can, by our inventive endeavours and otherwise, to "keep these home fires burning."

A meet of enthusiastic Millhouse (Sheffield) motor cyclists, who met last Saturday for the "first run" of a club that is about to be formed in the district. Reading from left the first four machines are new model Diamond, Douglas, Rudge, and Enfield.

**N.M.C.F.U. (Leeds).**

This branch of the N.M.C.F.U. held a very successful whist drive and dance last week, over 250 persons being present. Hon. secretary, Mr. T. W. Lancaster, 7, Evelyn Street, Chapeltown Road, Leeds.

A New Sheffield Club.

An effort is being made to form a new club in the Millhouses district of Sheffield. Motor cyclists in this district who are interested should communicate with the hon. sec. *pro tem.*, c/o Mr. E. W. Hatfield, Millhouses Garage, Sheffield.

Widnes M.C.C.

A meeting of Widnes motor cyclists was held recently, with the result that a new club has been formed which will be known as the Widnes M.C.C. An opening run has been arranged for the 21st inst. to Llangollen. Hon. secretary, Mr. A. J. Bailey, 57, Regent Road, Widnes.

Streatham and District M.C.C.

In connection with the above club, a meeting of members will be held at the Crown and Sceptre, Streatham Hill, at 8 p.m., on the 15th inst. All old members (and prospective new members) will be welcome, and it is hoped to re-organise the club and arrange a series of runs and competitions during the year.

Troedyrhiw and District M.C.

This club will hold its opening run on the 20th inst., when the members will meet at 9 a.m. at the Masons' Arms Hotel for a run to Porthcawl. Any local motor cyclist desirous of joining the club should attend the headquarters any Wednesday evening at 7.30 p.m.

Manchester M.C.

Many new members are being enrolled, chiefly, we understand, from the ranks of new motorists. The hon. secretary announces the first competition, in the form of a twenty-five miles speed judging trial, starting from the Swan Hotel, Bucklow Hill, Cheshire, on April 13th, at 2.30 sharp. This competition is open to all (members or otherwise). No watches or speedometers will be allowed, and four prizes are offered.

Newcastle and District M.C.C.

The Newcastle and District Motor Club is nearing the end of its period of suspended animation. A beginning will be made on the 17th inst., when a run to Allendale is in contemplation. Members, friends, and prospective members will meet at the Herd's House, North Terrace, Newcastle, at 10.30.

The secretary, Mr. Wm. Robson Lister, 2, St. Nicholas' Buildings, Newcastle, will be glad to receive intimation from any motorist who may desire to take part, and will, if necessary, arrange for lunch at the King's Head, Allendale.

Future Events.

 May 10.—*The M.C.C. Speed-judging Competition.*
 May 21.—*York and District M.C. Reliability Trial.*
 May 24.—*Birmingham M.C.C. Social Touring Trial. Week-end to Llangollen.*
 June 6.—*M.C.C. London - Edinburgh Run.*
 August.—*A.C.U. Six Days Reliability Trials.*

Edinburgh and District M.C.

The 1919 programme has not yet been definitely fixed, but the energetic band of enthusiasts, who were responsible for the popular Scottish Six Days, have already decided upon an open reliability trial, to be held on the 28th inst. Entry forms are now available from the secretary of the Trials Committee, Mr. J. W. Anderson, 6, Castle Terrace, Edinburgh. The question of a Scottish Six Days is under consideration.

N.M.C.F.U. (Sheffield).

On the 13th inst. members will meet at the New Town Hall at 11 a.m. for a run to Monsal Dale. On Easter Saturday those members who intend to participate in the run to the National Rally at Stratford-on-Avon will meet at 2 p.m.

N.M.C.F.U. (Newcastle-on-Tyne).

Mr. W. R. Squibb, hon. secretary of the Newcastle branch of the N.M.C.F.U., 63, Hampstead Road, Benwell Grove, Newcastle, advises a club run to Alston on the 20th inst. Meet at Haymarket at 10.30 a.m.

Hamilton and District M.C.C.

Mr. J. F. Burness, Reith Cottage, Hamilton Road, Motherwell, N.B., advises us that he is the hon. sec. and treasurer of the above club, and that an official announcement will be made shortly concerning the resumption of its activities.

N.M.C.F.U. (Portsmouth).

The N.M.C.F.U., Portsmouth and District Branch, will make their opening run to the White Horse, Easebourne, Midhurst, on the 18th inst., starting at 10.30 a.m. from headquarters, the Blue Anchor Hotel, Kingston Cross.

Bristol M.C.C.

The trustees and hon. treasurer of the above wish to notify all members that they are arranging for a meeting to be held on Monday, the 14th inst., at 7 p.m., at the Grand Hotel, Broad Street, Bristol, for the purpose of receiving a report from the hon. treasurer as to what has been done with the club's finances, and also to propose that the club resumes active operations. It is hoped that all members will make a special effort to be present.

Essex M.C.

The opening run will take place on the 13th inst. to the Green Man Hotel, Harlow, leaving headquarters, the Eagle, Snarebrook, at 11 a.m. sharp.

It is some considerable time since members had an opportunity of meeting on the road, and it is hoped that they will make a special endeavour to be present. It is proposed to arrange an impromptu competition during the afternoon.

Those desirous of participating in the Easter tour should advise the hon. sec. at once. The itinerary includes the Wye Valley, and embraces some of the finest scenery in the West of England. Easy stages have been arranged to give members an opportunity of seeing the many places of interest *en route*.

Members who intend to join the party, or who require further details, are asked to communicate with the hon. sec. (Holme Villa, Algers Road, Loughton) in order that hotel accommodation, etc., may be arranged.

C.F.B. CYCLE CAR.

Advance Particulars of a Miniature Four-wheeler which may be Marketed Shortly.

THE C.F.B. cycle car is not yet on the market, but is an ingenious design got out by a correspondent, Mr. F. C. Beauvais, who has been, for several years, experimenting with various cycle cars. This contributor advises us that he is making preparations to make the first machine to demonstrate its features. The drawings show an 8 h.p.

air-cooled V twin engine placed behind a dummy radiator, immediately behind which the body is brought forward into a V shape, so that the air passing through the bonnet is directed on to the cylinders and swept away behind them.

It is the designer's idea to reduce price as far as possible, and he hopes to be able to produce the vehicle at £100. The chassis is of ash suitably strengthened, and wherever possible steel pressings are

The friction-driven C.F.B. cycle car

employed. The engine drives a propeller-shaft, at the end of which a large cone is mounted. This engages with a friction wheel capable of being slid along the face of the cone. On the end of the shaft there is a crown wheel meshing with one of two bevel gears mounted on the countershaft. From countershaft to rear wheels the drive is by short belts

running over large diameter pulleys to the back wheels. Sliding the friction wheel up and down the cone naturally varies the speed, while changing over from one bevel to the other produces the reverse. This gear gives five speeds forward and five reverse.

The frame is mounted on cantilever springs fore and aft, and should consequently be very comfortable. The steering is by wheel, wires, and bobbins, the latter being of large diameter and carried underneath the bonnet.

Hammock pattern seats have been adopted, and, by undoing a clip, the steering wheel may be moved from the extreme off side to the centre, so as to be in a convenient position should the driver elect to drive solo. This displacement of the steering wheel is rendered possible by the fact that it is provided with a universal joint just behind the topmost pulley. It may also be noted that one seat may be folded away and the other slid sideways so as to occupy a central position in the body.

The following dimensions may be of interest: overall length 10ft., overall width 4ft., overall height 3ft. 4½in., track 3ft. 3in., wheelbase 7ft. 6in.

(Left) The steering is by bobbin and cables. The end of the steering-pillar has a universal joint, permitting the former to be used in or out of centre as desired.

(Centre) Showing the air-cooled V twin engine in position. The front of the body is wedge shape to deflect air currents past the cylinders.

(Right) Diagrammatic sketch of the friction drive, showing the bevel gears.

PETROL IN PLENTY—AT A PRICE!

The Petroleum Executive find it necessary to correct the impression which appears to prevail in some quarters that there is a serious scarcity of petrol. It is asserted that there are abundant supplies in this country available for all purposes.

The control system is being continued not in order to restrict supplies, but for the purpose of collecting the war tax of 6d. per gallon, the present arrangements for which must remain in force until the question can be dealt with in the new Budget.

Scottish Six Days' Trials.

The question of holding a six days' trial is at present under consideration by the Edinburgh and District M.C., the organisers of this popular event before the war, but, we understand, it is doubtful if such a trial will be attempted this year.

Special Features.

EVOLVING A MOTOR CYCLE FROM
FIRST PRINCIPLES.

CYLINDER DESIGN.

IN THE FUEL WORLD.

Motor Cycles by Passenger Train.

Through the action of the Coventry Chamber of Commerce, the restrictions on motor cycles over 1 cwt being carried on passenger trains have now been removed. The need for the abolition of this restriction has been referred to in *The Motor Cycle* several times.

Police Traps.

Police traps are in operation between Lewisham Obelisk and Bromley Market. The first is between St. Mary's Church and Catford Terminus. The second is on the London Road, just leading into Bromley Market, a third trap is on the Eltham Road, between Moltingham Lane and Lee Green Terminus, and a fourth on various parts of the Shooter's Hill Road.

A Former Zenith Rider.

A. B. Wade, formerly well-known as a rider of Zenith machines, informs us that he has had to resign his commission owing to ill health. He will be glad to hear from any survivors of No. 1 Battery, M.M.G.C., who would care to communicate with him with a view to a future re-union. Letters should be addressed to A. B. Wade, 3, Tydraw Place, Cardiff.

The Sarolea Motor Bicycle.

The Sarolea engine has been known in this country for quite a long time as being a very satisfactory Belgian production. The firm of Sarolea, at Herstal, near Liège, has been working hard since the Armistice to reorganise its factory, which was considerably damaged during the German occupation, and the firm is hoping very soon to begin to manufacture engines and motor bicycles once more. Towards the end of May it is hoped to produce a 4 h.p. single-cylinder motor bicycle, 85 x 97 mm., fitted with Sturmey-Archer countershaft gear, transmission by chain and belt, and all the latest improvements.

This information has been sent to us by M. Fagard, one of the Belgian representatives of the International Federation of Motor Cyclists. He states that the speed with which Belgian motor cycle firms can resume their pre-war activity depends to a large extent on the assistance the Allied Governments can give them in furnishing them with the necessary raw materials.

Children on the Highway.

The *Autocar* last week touched on a topic that concerns motor cyclists as much as car owners. The article in question was entitled "The Freedom of the Road and its Concomitant Obligations," and referred to the obligations of pedestrians on highways. In many districts during the war fast motor vehicles practically disappeared from the road, and the very young children now do not realise the difference in speed between a war lorry and a fast motor cycle. In consequence, we must safeguard both the child and ourselves by taking extra precaution, especially on passing schools and cinema shows. Time will however educate the younger generation to look after himself on the highway, but for the present extra caution will be necessary.

Singles on the Road.

A middle-aged family man who was beginning to take an interest in motor cycles said last week, "I suppose makers have stopped making V twins now? This remark was based on deduction, for the number of single cylinders seen on the roads compared with twins is particularly noticeable, though not at all extraordinary.

Runabout with Radial Engine.

The light four-wheeler with three-cylinder radial engine, to which we referred in a recent issue, will be made by the Cosmos Engineering Co., of Bristol. The wheelbase will be 7ft. 6in. and the track 3ft. 10in., the wheels being detachable and shod with 700 x 80 tyres. The transmission will be by shaft, and, complete with hood, screen, etc., the price, it is said, will be under £200.

All cars and sidecars entering Dublin have been stopped and searched by the police, with the object of ascertaining whether arms were being carried.

The M.C.C. opening run to Hatfield last week end. Many new machines were in evidence, together with a large number of well-known motor cyclists.

A Spring Frame Chater-Lea.

As mentioned in *The Motor Cycle* some time ago, the Chater-Lea Co. are introducing a spring frame model. This machine was present at the M.C.C. opening run last Saturday, and is a very striking looking outfit.

Prohibition of Imports.

We are informed by a reliable authority that the prohibition of imports is likely to be relaxed in the near future. It is probable that the various firms will be permitted to import 50% of the quantity brought into the country in pre-war days.

Coventry and Warwickshire Motor Club Opening Run.

Beautiful weather for the opening run brought a large gathering of members to the meet at Keresley House, the residence of the president, Mr. Edward Manville, M.P., on Saturday last. After a very cheerful reunion and excellent hospitality from Mr. and Mrs. Manville, a start was made with the first competition since 1914, this taking the form of a combined paperchase and speed-judging competition, for which eighteen competitors turned out. Mr. Sam Wright laid a sporting trail over twenty-two miles, ending up on the outskirts of Coleshill, where thirty-eight members afterwards met for tea, when the prizes were presented.

In the solo class the winner was Mr. A. L. Auerhaan (4 h.p. Triumph), second and third places being taken by Mr. W. Johnson (3 h.p. Enfield) and Mr. S. P. McGowran (4 h.p. Triumph). The winner's margin of error was 4½ m. slow.

In the passenger class the winner proved to be Mr. G. H. Vernon (8 h.p. Rudge), whose time was 1 m. fast. Mr. H. Nelson (5-6 h.p. Rudge) was second, 7 m. slow; and Messrs. F. Hulbert (4 h.p. Triumph), 7½ m. slow, and J. Bachelor (4 h.p. Triumph), 7½ m. fast, tied for third place.

The next competition will be held in May, the event being a long distance reliability trial for a fifty guinea challenge cup.

Birmingham M.C.C. Opening Run.

Upwards of a hundred members and friends turned out for the Birmingham M.C.C. opening run last Saturday to Stratford-on-Avon, in connection with which a speed-judging competition was held. The preliminary results include the following three names: E. Kibble and H. Kershaw (tied); —. Kuhn first among the non-members.

The New Indian.

One of the several new machines at Hatfield, last Saturday, was a new Power Plus Indian—ridden by Mr. E. Bridgman. It is the first of this model to be seen in this country. The chief novel features consisted of a Splittorf dynamo carried just level with the bottom of the front mudguard, and adequately protected by a wide shield. It was driven off the engine shaft by an enclosed chain.

Instead of the usual rods, the carburetter and ignition controls were by Bowden wires and twist grips.

The Motor Cycling Club's Opening Run.

This year the Motor Cycling Club decided to hold its opening run to the Red Lion Hotel, Hatfield, instead of its usual rendezvous, Brighton, owing to the fact that sufficient hotel accommodation could not be procured. This took place last week-end.

Essex Club Dinner.

Many of the leading lights of the Essex Motor Club were present at the reunion dinner held at Frascati's on Saturday last. During the course of a speech, Mr. S. G. Cummings, the president, remarked that it was the intention of the club to embark on a big programme of competitions and events for this year, and progress had already been made in organising the Westcliff speed trials. The enthusiasm displayed proved patently that the foundation of the club had in no way suffered during the last four years of enforced inactivity, and the future of the club seems assured.

Starting off competitors at the meet of the Coventry and Warwickshire M.C.C. last Saturday

The New Claudel-Hobson Carburetter.

Single Lever Control, Adjustment Device for Varying Climates and Easy Starting, Slow-running By-pass, and Top Petrol Feed to Float Chamber.

THE announcement that the makers of the well-known Claudel-Hobson automobile and aero engine carburettors are shortly producing a new type of single-lever carburetter for motor cycle engines will be of considerable interest, particularly since the new device is altogether different in general design from the model produced before the war.

After a protracted series of tests, the new Claudel-Hobson carburetter, which is known as the H.C.4, will be ready for the market at no very distant date. Since it is of the horizontal type and very compact, it should be much more easily adaptable to motor cycle engines than

the exterior into the side of the chamber surrounding the jet.

When the engine is running with the throttle open, a certain amount of air is drawn through the two ports upwards past the jet into the throttle in addition to the main column of air passing through the carburetter to the engine, the combined action of which causes petrol to issue from the jet and become finely atomised, since the two air streams meet together inside the throttle above the jet. The correct proportions of air and petrol at all openings of the throttle are automatically obtained by the varying amount of air passing the jet *via* the annular chamber from the two subsidiary air ports, a point which constitutes the chief feature of this carburetter, particularly since the automatic proportioning of the mixture is gained without the use of a single moving part except that of the throttle. The throttle is also specially shaped, in order that the main air stream passing across the top of the jet shall have the maximum of efficiency in the atomising process when the air speed is comparatively slow at small throttle openings.

In order to allow for changes in climate or temperature, a remarkably neat and simple device is fitted on the carburetter, as shown in fig. 2. Projecting into a slot cut in the main air intake side of the throttle is a small streamline vane, which is connected to a small thumb lever on the outside of the carburetter barrel. By moving the lever the vane can be rotated in the slot of the throttle, thus varying the amount of air drawn through the carburetter to the engine, whilst, at the same time, the throttle can be rotated independently in its housing. By this means it is possible at any throttle open-

Fig. 1.—The Claudel-Hobson horizontal-type carburetter sectioned to show details of throttle, jet, and float chamber. The arrows indicate the path of air drawn vertically past the jet into the interior of the throttle from the auxiliary air ports A and B. The top feed of petrol to the float chamber will be noted.

the earlier Claudel-Hobson model, as it can be attached directly to the induction pipe in the usual manner without special alterations.

Although entirely automatic in action with the single lever control, the carburetter is extremely simple in design and operation, whilst the easy method of adjustment for climatic or temperature conditions and the slow-running device are two features which will make a special appeal to the motor cyclist.

Auxiliary Air Ports.

The main portion of the carburetter consists of a horizontal barrel casting, in the centre of which is a vertical rotating throttle fitted with a single control lever. Across the centre of the throttle a tunnel is bored equal in internal diameter to that of the carburetter barrel, and by rotating the throttle between given limits the column of air drawn through the carburetter to the engine can be varied. Immediately below the carburetter barrel, and protruding into the centre of the throttle is the jet, which is housed in a small annular chamber, as will be seen in fig. 1. Communicating with the annular chamber are two ports, A and B; one extending from the interior of the main air intake of the carburetter to the jet, whilst the other is drilled directly from

Fig. 3.—Plan of the Claudel-Hobson carburetter in section, showing the path of air passing the adjustment vane for temperature across the jet in centre of throttle and through the adjustable by-pass to the engine. When the throttle is rotated to the left the main stream of air is drawn straight through the throttle across the jet horizontally.

ing to vary the mixture without altering the permanent setting of the carburetter, in addition to which both the throttle and the vane can be shut right off, thus affording an easy means of creating an abnormal suction on the jet for starting up purposes, since the whole of the air has to pass the jet *via* the two subsidiary air ports. The thumb lever and vane are kept in position by a small spring, and are easily withdrawable at any time.

By-pass for Slow Running.

This device will undoubtedly prove extremely useful, for although the permanent setting of the carburetter is not altered in any way, it is at the same time possible to get the best results in fuel consumption and engine efficiency under all running conditions generally met with, by the simple movement of a lever.

The by-pass for slow running on this carburetter is shown in fig. 3, and it consists of a pointed screw projecting into a drilled passage, extending from the side of the throttle chamber to the induction pipe end of the carburetter barrel. The screw has a hexagon head and a lock-nut for adjustment purposes. Under ordinary circumstances the throttle is closed for slow running purposes, but the small amount of mixture required to keep the engine ticking over is drawn through the passage and past the by-pass screw at the side of the carburetter, and by adjusting the screw the engine can be set to turn over at the smallest number of revolutions possible.

Fig. 2.—The diagram on the left shows how the temperature adjustment vane engages with a slot in the rotating throttle. (Right) The vane with operating thumb lever detached from the carburetter.

The New Claudel-Hobson Carburetter.—

To prevent "blow-back" of mixture from the throttle and, therefore, waste of fuel, a bell-shaped cap is screwed on the outer end of the carburetter barrel. Any tendency for the mixture to escape at low engine speeds when the suction is intermittent is frustrated by the cap, but at the same time the entry of air into the carburetter is in no way restricted.

By releasing two spring clips the needle, float, and lid of float chamber can be readily withdrawn.

The chief feature of interest in the float chamber fitted to the new carburetter is the top feed arrangement of petrol. The float needle has no toggle and weight mechanism, and it simply engages directly with a seating screwed in the lid of the float chamber. An adjustable collar is fitted on the needle, so that the level of petrol can be regulated, whilst the needle is kept central by small guides in the base of the float chamber and in the needle valve seating respectively. By withdrawing a small screw above the needle valve seating in the float chamber, air locks in the petrol feed pipe can be eliminated should occasion demand it.

Accessibility.

As it is only necessary to unscrew a petrol pipe union and disengage two steel clips to withdraw the lid of the float chamber, it is an easy matter to get at the needle and float at any time.

Practically the whole of the carburetter is made of gunmetal, and the construction is particularly sturdy throughout. The makers, Messrs. H. M. Hobson, Ltd., 29, Vauxhall Bridge Road, London, S.W.1, will shortly announce the date when this new model will be ready for the market, but in the meantime it may be stated that either a union or a plain flange joint will form the means of attachment of the carburetter to the engine or induction pipe.

The Claudel-Hobson horizontal-type carburetter.

THE 8 h.p. BLACKBURNE TWIN.

New Entrant in the Big Twin Sidecar Class of British Motor Cycles.

WE were afforded an opportunity to see and test the new 8 h.p. twin Blackburne last week, and as space in this issue is not available to do justice to the performance of the machine, we postpone details of the trial until the next issue. The photograph given here will show the reader how this new entrant into the big twin sidecar class appears now it is complete.

As will be seen, the outfit presents a very handsome appearance. The frame is of the straight tube type with diagonal

top tube, and the mudguarding is well carried out. The chief feature of the engine, however, i.e., the outside flywheel, is not seen, as it is on the side next to the sidecar, but many of the details of the engine are shown and will not fail to interest.

The bicycle part of the machine is similar in many details to the 4 h.p. model recently described in *The Motor Cycle*. The whole machine is symmetrical in design, even the frame tubes being sloped to the same angle as the cylin-

ders. The magneto chain case is split horizontally, the two halves being secured by two screws, the removal of which allows instantaneous access to the chain. It will be noted that the design of the front cylinder exhaust pipe is somewhat peculiar, the pipe being tapered to a funnel shape from the cylinder union, the final exit to the expansion chamber being 1½ in. diameter. This, it is claimed, assists in the expulsion of the exhaust. Coil springs are used for the sidecar suspension.

The new 8 h.p. Blackburne, the only "big twin" fitted with an outside flywheel. The engine has 85 × 88 mm. cylinders with detachable heads.

SALE OF U.S.A. ARMY MOTOR CYCLES.

Sidecar Outfits bought by Dealers at Figures Higher than the Catalogue Price.

A SALE of motor cycles used by the United States Army in this country was held by the Grahame-White Co., Ltd. (Auction Department), at the London Aerodrome, Hendon, London, N.W., last week, on instructions received from the U.S. Liquidation Commission. Altogether there were twenty-three motor cycles, and the prices fetched were remarkably good. The organisation of the sale was particularly well carried out, and the Grahame-White Co. deserve congratulation.

The sale opened with the disposal of a number of lorries and a few touring cars, and the first motor cycle to be put up was Lot 74. So far as motor cycles were concerned, the catalogue needed considerable alteration, because it was first announced that there would be nine Harley-Davidsons for sale, but 4 h.p. Douglases and sidecars took their place, and there were no motor cycles of American manufacture for disposal. The Douglases were in fairly good condition and vastly superior to the motor cycles sold by the Government Disposal Board at the recent sales we have attended. Nearly all were fitted with lamps, there were few parts missing, and, though there were signs that the machines had been used from a year to eighteen months, as the catalogue stated, they were in fair order.

One of the nine new Enfield outfits that were disposed of at good prices. It made £145.

Bidding for the first Douglas started at £50, and it was eventually knocked down at £70. Probably because the buyer did not turn up promptly it was put up for auction again, and the next time fetched £65. Of the fourteen Douglases sold, six fetched £65 each, six were sold for £70 each, one was sold for £75, while the last on the list fetched £77 10s.

In the afternoon a number of 6 h.p. Royal Enfields, brand new and as taken out of their crates, were put up for auction. They were well fitted up, with luggage carriers attached to the sidecar bodies, and many had D.A. cylinders fitted. The bidding started at £100, and the first machine was knocked down for £145, the purchaser being heartily cheered. Six more outfits fetched the same figure, and three were sold for £147 10s. each.

Good Prices for Flat Twins.

A 6 h.p. water-cooled Humber and sidecar was sold for £95, while a 4 h.p. Douglas and sidecar which had been in use for about a year and was fitted with new tyres fetched £85. Another 4 h.p. Douglas and sidecar was sold for £80, while the last motor cycle on the list, a second-hand 6 h.p. Enfield and sidecar in fair condition, was sold for £110. Many of the new Enfields were bought by the trade.

A water-cooled 6 h.p. Humber outfit which made £95.

A 4 h.p. Douglas sidecar sold for £77 10s.

SELLING THE SIDECAR.

SOME rather amusing hints to agents on selling a sidecar were given in an American paper recently. "When you begin to talk motor cycle to Mr. Man-with-the-money, it's about time to say something about sidecars to the Lady-who-married-Him," is a useful hint in a country where motor cycles are used chiefly as solo mounts. The writer of the hints suggests that it is not wise to leave the sidecar proposition to be explained by the "hubby." "If the

job of making a sidecar enthusiast out of the missus is left to him, he may not deliver the goods. Mr. Man-with-the-money may try to explain matters, but maybe he's not a good explainer—even if he is married. Suppose he is not married? The only thing to do in that case is to watch where he goes on Wednesday and Sunday nights with his hair all slicked up and cologne on his coat lapel—then slip your sidecar letter under the girl's front door."

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor "The Motor Cycle" Herford Street, Coventry and must be accompanied by the writer's name and address.

A TABLOID HISTORY OF AIR-COOLING.

Sir,—I am glad to learn from "Revs" (page 335, April 3rd) that the Canton-Unné is a rotary engine. I have only encountered static radials of this make.

The loss of b.h.p. in a rotary ascribable to radial wind resistance is about 10%.

ROAD RIDER.

THE SUPER-SCOOTER.

Sir,—A misunderstanding exists among our friends regarding the relationship of Messrs. Trist and Co. and Messrs. Tankettes, producers of the super-scooter. Messrs. Trist, in order to help ex-Service men, the inventors of Tankettes, are affording all possible facilities in their works and London offices for the early production of these machines, and although a friendly *liaison* exists between Messrs. Trist and Tankettes there is no financial or any other agreement.

TANKETTES.

CHAIN TRANSMISSION.

Sir,—Your correspondent enquires as to the effect on chain transmission of unequal rise on the rear wheels, with its consequent twisting effect.

This state of affairs exists on all chain-driven cars, and no injurious effects are noticed. The chain is a wonderfully flexible medium, so much so, in fact, that on one car advantage was taken of this, and a castellated or other sliding coupling on the clutch was dispensed with. When the clutch was out, therefore, the chains—about 3ft. centres—ran one-eighth of an inch or so out of line, but with no harmful results.

H. RAYMOND.

MOTOR SCOOTERS IN ENGLAND.

Sir,—I notice that on page 197 of *The Motor Cycle* of February 27th mention is made of the number of motor scooters at present in London. I saw a girl riding one between East Molesey and Esher one afternoon last October. I was driving a Crossley-Bat tender when the girl in question came out of a side road on to the main road, about twenty yards in front of the car. Apparently, she took the corner too fast, because she ran on to the footpath on the near side of the road and turned a somersault into the hedge. Luckily, the rider was not hurt, but I remember it rather put the wind up me.

Blandford.

SINBAD.

SINGLE-SPEED SPORTING MODELS.

Sir,—I am sure that the manufacturers do not pay sufficient attention to the $3\frac{1}{2}$ h.p. four-stroke single and fixed engine. That is simplicity, and simplicity is the keynote of reliability. Everybody does not want a gear box, clutch, kick-starter, etc., to clean and to keep in order. A machine without this, with a well-tuned engine, makes a good light touring machine, and one that ought to cost much less than the other model—in other words, a fool-proof machine, and the machine for the million.

I am glad to see that a few readers have a good word for the simple single. If a maker was to put a model on the market at a reasonable price, consistent with good workmanship, he would deserve to do well.

W. J. STEVENS.

GEAR BOX LUBRICATION

Sir,—We read with considerable interest a paragraph in your paper dealing with a paper recently given by Capt. G. W. A. Brown, before the Institution of Automobile Engineers.

So far as gear box lubrication is concerned, we venture to think that this problem has been satisfactorily solved by our Ambroleum. We are glad to say that, our plant now

being free from war work, we have been able to resume on a large scale the manufacture of Ambroleum, and we expect in a week or two to execute all demands.

STERN'S LTD.

AVERAGE SPEEDS.

Sir,—I have heard such a lot of rot about average speeds. A friend of mine once told me that he had done a hundred and twenty miles in three hours on the road! He got quite angry when I suggested that his watch wanted regulating. I find that twenty miles per hour is a very fair average for a journey of over a hundred miles. I have as yet never exceeded that average. One can, of course, for short distances make pretty good averages. I have done ten miles in fifteen minutes, but then, the road was in perfect condition, and was also nearly straight the whole way. I am afraid I think a motor cyclist a liar if he says he has kept up an average of over thirty miles per hour for a hundred miles or more. I have no doubt it has been done, but then, the case in question is so isolated that it is probably "the exception that proves the rule."

Slough.

R.N.

REVS. AND THE SINGLE.

Sir,—Your article of March 20th raises the question in my mind of the physical causes tending to limit the revolutions of any particular engine. The time for closing of spring valves seems to be one of the more important causes. I took the first machine handy and weighed the parts. Weight of valve complete, 1,800 grains, plus one-third weight of spring 600 grains gives 2,000 grains, or $\frac{2}{3}$ lb. for the moving parts. The spring is 2.75in. long unloaded, and works between 1.6in. and 1.85in. for the $\frac{1}{4}$ ft. lift with a mean strength of 17 lb. The time of snapping over is obtained from the usual formula:

$$t \text{ seconds} = \sqrt{\frac{w \times \frac{1}{2}}{10.1 \times 17}}$$

if gravity is taken as 32.2. The time is therefore barely under 0.005 second or exactly 0.00466 second.

With a 26in. wheel and a gear of 5 to 1 the engine revolves 3,880 times in a mile. At a speed of 40 m.p.h. this is 2,588 r.p.m.

The engine therefore turns 360° in 0.0232 second, or makes one stroke of its Otto cycle in 0.0116 second. As the valve takes 0.00466 second to close the engine revolves 180×46.6

116 degrees, or practically 72° in this time.

Here at once is an obvious physical limit to the speed of the engine, as loss of suction must result from the late closing of the exhaust valve, and loss of compression from the lateness of the inlet valve, whilst the frictional losses remain unchanged.

The angular movement of the engine at a definite speed during this delay varies only as the time of closing, and this figure varies directly as the square root of the weight of the valve, and inversely as the strength of the spring. Hence, the angular movement can be diminished 5% by increasing the strength of the spring by 10% or by reducing the weight of the valve by 10%. The price to pay for such a gain is the increased work on the valve gear and the consequent danger of excessive wear or breakage.

The greatest road speed ever attained by this engine in low gear worked out at 2,600 r.p.m. On top gear it can barely touch 40 m.p.h. when in perfect order. I am not an expert in these matters, and should value the comments of those who are.

J.H.H.

THE NEW A.B.C.

Sir.—I am interested to note a few criticisms of the A.B.C. motor cycle in your issue of March 27th.

Mr. H. Walker says he was looking for a more accessible and a simpler machine, and quotes "Ixon's" suggestion of minimising bolts, flanges, awkward corners, etc., which are difficult to keep clean.

This, I think, everybody will thoroughly agree with, but I am quite sure that if Mr. Walker studies the design again, or, better still, examines an actual model, he will most probably change his opinion on this point.

It is the old question of the best compromise between reliability, strength, accessibility, efficiency, and various other items, all of which have their degree of importance, and a designer can generally only improve one point by sacrificing another.

For instance, it is easy to keep a machine clean if it is not fitted with a gear box or clutch, or springing, etc., etc., but the machine is then not very pleasant to drive, or so useful, and the same argument might apply to any single item of the design.

The engine unit is certainly not so simple and smooth externally as a bare single-cylindere engine, such as we have been accustomed to see, but the gear box is not hung under the bottom bracket with the clutch sticking out of one side, operated by external mechanisms with innumerable joints, and the primary drive does not consist of a chain running at high speeds, which makes a noise and has to be housed in a bulky-looking chain case; and the oil is not carried in a tank with protruding hand pump, drip feed, external piping, etc., nor is the change-speed lever attached to the top tube through bell cranks, rods, and hinge pins; but all these items are made in one enclosed and compact unit, which can be taken out of the frame with one spanner and a pair of pliers, and it is completely protected underneath and in front by an efficient shield.

The change in length of the chain wheel centres, on account of the rear stays not pivoting exactly on the centre of the driving sprocket, is one of those theoretical points which I doubt if anyone has ever been able to make evident in practice. The variation in length is not one-quarter of the amount the chain stretches under the pull of the engine, and in the A.B.C. machine in particular it is a matter of a few thousandths of an inch throughout the whole range of the springing.

Mr. Walker refers to the timing train of five wheels and the four-speed gear box and bevel all taking a percentage of power, and I have come to the conclusion that Mr. Walker's ideal must be a single-gear machine, such as were used in 1910.

In the timing gearing there is one wheel on the crankshaft, one driving the camshaft, one driving the magneto, and, in order to get the correct ratio, two driving the oil pump. These two latter could easily be obviated by returning to an oil tank and hand pump, drip feed lubricator, etc., with its consequent constant attention and extravagance in oil, coupled with shorter life for the engine, and I do not think that many motor cyclists would care to return to this for the sake of two small gear wheels running in oil and absorbing an infinitesimal amount of power.

Then Mr. Walker says the gear box may give direct drive on top, but not in the sense that it does on other machines, as it really gives direct drive to the bevel only. If Mr. Walker will think again he will see that by putting in the bevel I have reduced the number of drives from 4 to 3, as compared with all-chain machines, which have one drive from the engine sprocket to the chain, one from the chain to the countershaft, a further one from the countershaft to the rear chain, and a final one from the chain to the rear sprocket.

In the A.B.C. machine there are the two last mentioned, and in place of the two first mentioned (which is an unpleasant high speed engine chain, necessitating adjustment and difficult adequately to lubricate, noisy in operation, inaccessible, and very subject to back-lash) there is one reliable bevel drive completely enclosed, yet accessible, much smaller in bulk, adequately lubricated, and quiet in operation.

With reference to Mr. John Holland's criticisms and suggestions, I will take these in the order he names:

1. "Why should the front brake not be placed on the left of the wheel, thus allowing the speedometer drive its usual place on the right?" This was an error on my part, and has since been modified. At the same time, I might mention

that it was only modified in case the motor cyclist wished to fit his own pet speedometer, as the A.B.C. speedometer drive is incorporated in the gear box.

2. "Mudguards seem unduly narrow, with valances close to the wheel." These mudguards are not at all narrow in the actual machine.

3. "The splash guard is not high enough for winter riding." Careful experiments have been made in this direction, and it is only at very high speeds and on very wet roads that splashes can reach the top.

4. The oil spray directed on the chain is, I agree, a little doubtful, and is being thoroughly investigated.

5. "Why not lubricate the fork links by drilling the steel pins and fitting a grease cap on the end of each?" I should like to know what benefit Mr. Holland claims by this method? As far as I can see, the grease or oil has to pass down a long small hole, and through a further hole or holes, drilled into the side of the pin. This weakens the pin, increases the amount of drilling, increases the length of path of the thick lubricant, places the greaser in a more vulnerable position, and has in car shackles generally found to be very bad. Why should not the greaser be placed right on the very spot where the grease is required?

GRANVILLE BRADSHAW.

Sir.—I am glad to see Mr. Bradshaw has made an engineering job of his new effort. I had a little to do with his pre-war models, which were also beautiful little engines. On the power unit drawing I fail to see the engine suspension lugs. How is this attached to the frame? Also, would not a support for the carburettor be advisable, as the weight of the induction pipe and carburettor tend, with vibration, to make an air leak at the cylinder joint? Also, does only the left cylinder exhaust valve open when the lifter is raised, as is apparent by your diagram?

As for minor improvements, what are nicer or cleaner than disc wheels—stampings, not those awful spokes; and the toolbox, could not one be made on each footrest, as they would be accessible, large, and neat? The rear mudguard seems hardly big enough.

C. E. SMITH.

LEST WE FORGET.

Sir,—Referring to *The Motor Cycle* of March 27th, page 292, "Occasional Comments," by "Ixion," on "Engine Bearings." Your gifted contributor refers to the increased application of roller bearings to the big ends in the new season's goods. May we call your attention to the fact that roller bearings were fitted to the Rudge gudgeon pin and big end bearings in April, 1912 (seven years ago).

RUDGE-WHITWORTH LTD.

BORROWING AN IDEA FROM HENRY FORD.

Sir,—I think your contributor would do well to pay back the idea he is borrowing from Henry Ford, so far as its applicability to cycle car design is concerned. Here we have the two extremes: one a tractor of about 4 m.p.h. speed, where weight and short wheelbase are an advantage; the other in which lightness is a *sine quâ non*. One might just as well start designing a traction engine on the lines of a Levis. If enclosure of cardan-shaft, etc., is desirable, well, put a case round it, and do not increase the unsprung weight enormously merely to close in the shaft. I do not see him selling many to customers when explaining the 30 m.p.h. governor stunt to prevent overturning of the chassis.

In your description of the Warner spring frame attachment you state that the rigidity of the frame is not lessened. I beg to differ. With an ordinary frame the axle supports are rigidly connected by the axle, whereas this connection is now removed. For solo riding probably the arrangement might do, but get a heavy sidecar attached to the chain stays, and see the "whip" taking a corner at speed.

WM. A. DAVIS, A.M.I.M.E.

ALUMINIUM COOLING.

Sir,—"By the way," said the Cheshire Cat, "what became of the Baby?"

"It turned into a Pig," replied Alice.

"Ah!" said the Cheshire Cat; "I thought it would!" (I quote from memory.)

What a world of trouble! The little thing decked out so convincingly: "as large as life and twice as natural"—to its nurse; and along comes that wretched cat, with a grin half an hour in length, and points out that the dear infant's clothes are lumpy in the wrong places. Dear, dear!

All very well to laugh, fellow readers, but do you realise to what sort of life the inventor is condemned in this nominally free and doubtfully happy country?

It will be within the recollection of many readers that during the month of July, 1917, there appeared in sundry issues of this journal, with appreciative editorial comments, a history of the genesis of aluminium cooling; also an *in extenso* reproduction of what the Editor was good enough to designate a "master patent," dated August 12th, 1898. This specification contained the following phrases:

"I provide the tube, cylinder, or other body from which heat is to be radiated with a partial or total covering of a metal having a higher conductivity than the metal of which the tube or cylinder itself is composed. . . . It is, of course, necessary that the conductive covering should be applied to the radiating body in such a way as to ensure intimate contact between the metals of which the body and covering are composed. . . . In order to ensure intimate contact between the metals, it is preferable to cast the gills in position upon the cylinder, but other methods . . . may be employed. . . ." (Tapering, shrinking, etc., described.)

Referring to the rapidly extending successful use of this invention, the Editor added remarks that, unfortunately, are as true to-day as in 1917:

" . . . War-time developments on aeroplane engines have demonstrated that such a patent might have been worth annually many thousands of pounds. . . . He (the inventor) was too much in advance of the times, and suffered as many other far-sighted men have done. . . . We regret to say that he saw no direct benefit from the patent. . . . It is galling to think that a patent expires automatically at the end of fourteen years, when during that period no one recognises the patent, and yet subsequently the scheme covered by the patent specification becomes common practice. . . . Mr. Ayton's patent was a strong one, and exceptionally lucid in expression."

No, sir, no direct reward—in cash. But think of the joy and gratification of seeing British officers rewarded and decorated for the successful exploitation of the very form

illustrated in the patent drawing, and the delirious delight of opening *The Motor Cycle* in 1919 and reading the following "modest" and "courtous" pronouncements over the signature "Edgar Russell":

"I have been experimenting for some considerable time with a view to obtaining better cooling of motor cycles (*sic*) and other air-cooled engines. . . . Numerous attempts have been made to fit ribs to iron or steel cylinders. ANY method of CASTING ON or shrinking the ribs over a barrel is BAD. . . . This" (his cast-on) "construction marks a distinct advance in CYLINDER DESIGN. . . . The method should be of great value," etc. (The variations in type are mine.)

And "this construction"? It proves to be, I gather, an application of a not very reputable art or device familiar to most foundrymen. It has been largely used for the "faking" of defective castings and the manufacture of cheap bedsteads. The claims made for the results indicate a joint similar to that obtained in the very engine illustrated on page 30, issue of July 12th, 1917, and also in the boiler tubes with which the comparative steam-raising tests were successfully carried out, *circa* 1899!

Evidently, therefore, in order to find the real novelty "of great value" which constitutes such "a distinct advance," we must take Mr. Russell's advice: "wait" a few months "and see" what the Comptroller leaves in his final specification.

"Well," says the reader, "and what has all this to do with me?"

Simply this, Mesdames et Messieurs: I have every reason to believe that ere long efficient and satisfactory waterless cooling for every class of motor vehicle will be *un fait accompli*, and that this desirable result will be attained by intelligent improvement upon the already successful system that Mr. Russell pretends, without any show of justification, to condemn. I therefore consider it inadvisable that prejudice should be engendered against waterless cooling by the booming of alleged "improvements" which are essentially *reversions*, and which, as such, are likely to be the cause of disappointment and dissatisfaction. Real progress, in the sense of the attainment of an efficiency comparable with that of a good water-cooled engine under equal conditions, is only to be arrived at by due consideration of all the essential factors, and these embody certain points that, to the best of my knowledge, have never yet been placed before the public or the trade in any published communication. As to this, I will, if the Editor desires, it, be more explicit at the earliest moment I am free to do so.

R. AYTON.

SPARE PARTS FOR OLD MODELS.

Sir,—I read with some surprise in *The Motor Cycle* (March 27th) a letter, signed "J." complaining of unfeeling treatment by A.B.C. Motors, Ltd., in the matter of spares for old models. I should just like to say that I am a rider of a 1915 A.B.C., and on the few occasions on which I have required spares, even during the war period, I have not only received the most courteous treatment and attention, but the spares as well.

I am prepared to admit that there is room for improvement in the way riders are treated by many firms in this matter, but I have always received the best possible attention from A.B.C. Motors, Ltd., who, if they merely retain the same standard of excellence in post-war productions as they did pre-war, deserve the best wishes of the motor cycling public.

or of leading Booksellers and Railway Bookstalls.

CYLINDERS.

Extracts from a Paper read before a Graduate Section of the I.A.E.

ON Tuesday of last week Mr. A. Niven read a paper on "Cylinders" before the Coventry Graduate Section of the Institution of Automobile Engineers. Mr. A. A. Remington, of the Wolseley Co., was in the chair.

The major part of the paper was too technical for the average motor cyclist, but there was much to interest him in view of the consensus of opinion (many times expressed in these columns) that aero engine practice will be reflected in future motor cycle engines.

The author pointed out that in aero engines the cylinders weigh from 20% to 25% of the total weight of the engine, and for that reason the cylinder has received, and is still receiving, probably more attention than any other part.

"The weight saved by the adoption of aluminium is not so great as one

having no pockets or corners to cause trouble. Spark plug can be situated at the centre or offset as desired.

"(b.) Domed head, with overhead valves located at an angle. This type presents no machining difficulties, and has also a symmetrical head. The diameter of the valves in this type is limited by the diameter of the cylinder bore, unless valve cages or a detachable head is fitted. Spark plug is offset on crown or located at the side.

"(c.) Flat cylindrical head, easily machined, with valves side by side in the crown. The remarks regarding diameter of valves and location of spark plug in type (b) also apply to this type.

"(d.) Chevron head. The valves, the diameter of which may be slightly larger, according to angle of chevron, than those in types (c) and (b), are located at an

dying a natural death. The only thing in their favour lies in the valve position, which facilitates the 'grinding in' and removal of valves.

Aluminium Cylinders.

"Aluminium from a commercial, combined with an efficiency, point of view is the favourite material for air-cooled cylinders, and, provided a good contact is made between the cylinder and its liner, and an efficient fan and cowling system is incorporated, the production of an engine as good as any modern water-cooled high efficiency engine is quite within reason. The numerous advantages such as low petrol consumption, less weight and cleanliness, would outweigh the loss of power in propelling the air fan.

"The making of a satisfactory contact between the liner and cylinder is a serious problem which up to the present has not been solved. The cylinder, when heated, expands away from the liner, and the conduction is partially destroyed, a leak occurs, accompanied, of course, by an immediate drop in power. Numerous attempts have been made with the idea of combining the conduction qualities of aluminium with the strength and wearing surface of cast iron, at the same time avoiding a troublesome joint. Thus, we have the Buchanan bimetal construction in which an iron shell is encased in aluminium and the Russell process of casting aluminium fins in position on a cast iron cylinder barrel, both inventors claiming contact to be perfect under all conditions. Die casting aluminium fins on to a steel or cast iron liner has also been tried."

During the evening it was mentioned that the conductivity of aluminium may be increased about 15% with air-cooling and 6% with water-cooling by stove enamelling the rough cast surface, while the conductivity of ordinary cast iron cylinders, such as are used in motor cycle engines, is increased by about 7% by this method.

Types of cylinder heads and valve positions shown diagrammatically.

would at first imagine," said Mr. Niven, "taking into consideration the extra wall thickness required and the additional weight of a cast iron or steel liner and valve seats. The extra liner and valve seats would, of course, be unnecessary in the case of a sleeve valve engine, where the sleeve works direct in the cylinder, and provides the working surface for the piston. Cast iron pistons working direct in aluminium have been tried, but without success, the wear and surface of the cylinder bore being far from satisfactory.

"The glass surface attained under working conditions in the bore of a cast iron cylinder is ideal—a fact that should not be lost sight of when piston friction and absorption of heat by the cylinder wall are considered.

angle in the cylinder crown. Spark plug is usually placed at the side.

"(e.) T head, which cannot be machined. The valves are located in pockets on opposite sides, the spark plug being located above the inlet valve.

"(f.) L head, like its forerunner, the T head, cannot be machined. The valves are side by side in a pocket at the side.

"In types (a), (b), (c), and (d), where the heads are machined and polished, thereby preventing carbon deposit and pre-ignition, accurately equalised compression spaces can be obtained, with beneficial results in power and efficiency.

"Types (e) and (f), with their varying compressions owing to unmachined heads, their uneven cooling and distortion, are

Position of Valves and Form of Compression Space.

"The chief difference in cylinder design lies in the location of the inlet and exhaust valves, and in the form of the compression or combustion space. The loss of heat through the cylinder wall and crown depends very largely upon the area of the compression space surface, so this is usually designed so as to have the least wall area in proportion to its cubical contents. From this point of view, it will be obvious that the hemispherical crown is ideal, this type of head being approached in the sleeve valve engine cylinder, whereas in a poppet valve headed cylinder the surface is about 62% greater than that of a corresponding hemispherical head.

"The various types of heads and valve positions are shown diagrammatically above.

"(a.) Sleeve valve, with domed detachable head, which can be machined easily. The compression space is symmetrical,

Prospective members of Public Schools M.C.C. There is no reason why the P.S.M.C.C. should not become one of the strongest and most influential in the country.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Enamelled Brake Rim.

?

I have had my Douglas wheels re-enamelled, and the firm have enamelled the plated belt rim by mistake. Please say if it is possible to remove the black without damaging the plating.—W.H.W.

The enamel may be removed by soaking the rim in a hot solution of caustic potash, and scrubbing off with a brush. Why have the rim plated? It is a most unsuitable finish for a belt rim.

Difficult Starting.

?

I have a 1913 twin Rex, which I cannot start up. I have just had the magneto down and cleaned it. On the bench it sparks well, but on being replaced it will hardly spark, the sparks being very faint. Which cylinder is the best to start timing from—the front or back? The engine is also very hard to turn. I should be greatly obliged for a little information on these points.—A.G.

The reason for the magneto not sparking when on the machine is probably due to the fact that you do not rotate the engine fast enough. It is customary to time the engine first of all in the back cylinder, which in most cases is No. 1. The reason why the engine is hard to turn is not clear to us. You must find this out for yourself by examining it carefully to see if there is any stiffness anywhere, after having injected a little paraffin into the cylinder.

Two-stroke v. Four-stroke.

?

I have discarded a 4 h.p. combination, and am thinking of purchasing a lightweight. I have had no experience of two-strokes, but am told (1) that they are less economical (of petrol) than four-strokes; (2) they are more difficult to start; (3) they require more frequent decarbonising, and (4) are not such good hill-climbers. I should be glad of your opinion on these points. I think a 2½ h.p. two-speed of either variety ought to take me anywhere.—J.A.B.

(1.) This is quite true. (2.) This does not follow, if the carburetter is properly adjusted. (3.) A two-stroke may need more frequent decarbonisation if over-oiled. (4.) This is quite wrong. The average two-stroke is a better hill-climber for its size than a four-stroke. The two-stroke is not quite so economical in petrol as a four-stroke, nor is it so fast on the level, but it is a far better hill-climber than a four-stroke with the same engine dimensions.

Magneto Trouble.

?

I have a two-stroke motor cycle, which is fitted with a magneto, and which is without name or number. Unlike a Bosch, this magneto makes and breaks contact from a face disc. After riding five or six miles, the engine will suddenly pull up. I dismount, take the cap off the magneto, syringe out the front with petrol, place the cap back again, remount, and go merrily for another five or six miles, when the same thing happens again. Will you please tell me the cause and suggest a remedy?—MAG. KEN.

The magneto is probably a U.H., handled by Messrs. S. Wolf and Co., 115, Southwark Street, London, S.E.1. The trouble seems to be due to over-lubrication. Some of these magnetos, being provided with ball bearings, have the bearings packed with grease, and they will run for several years without attention. If you have been attempting to oil the magneto, or oil is reaching the magneto, then the trouble of which you complain would occur. At first, we were inclined to think that the trouble was due to a faulty condenser connection, which would cause excessive sparking

at the platinum points, but if this were the case merely washing out with petrol would not, we think, have cured the trouble, as it would necessitate the platinum points being touched up with a file.

Sidecar Track.

?

Can you tell me what is recognised to be the correct distance between the motor cycle and sidecar wheels? My 4 h.p. combination is very heavy on tyres, and it seems to me that my chassis is wider than the average; the distance from the centre of the cycle to the centre of the sidecar wheel is 3ft. 7½in. I have checked over the alignment, which is correct according to some articles which appeared in *The Motor Cycle* some time ago. There is a distinct pull on the front wheel towards the sidecar when riding.—H.D.

The track is quite an average width. Both sidecar and cycle wheels should be absolutely in alignment, both vertically and horizontally. If the front connection is strained or too long, the sidecar wheel will naturally wear the tyre quickly, and pull over. See that your connections are rigid, and note whether the sidecar stub axle is bent.

Why stand? This question was answered by Mrs. Kent, the inventor of the Moto-Frip, one of the first motor scooters, which appeared in 1911, for in 1913 it re-appeared with a bucket seat.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed & Co.** Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000 c/o "Motor Cycle," 20, Tudor Street, E.C.4. Replies to Box Number advertisements containing remittances should be sent by registered post.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged; when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

FORWARD PLUGS.

An abundance of unsolicited testimonials from users of Forward Plugs—of which there's a type for every engine—confirms our claim that they are stronger and will stand up under harder usage than any other make—let us send you details of all our various models.

Telling Testimony to the Forward Fastener

Price 1/6.

Read this. It comes from a customer at Stoke-on-Trent.

"About three years ago I sent for one of your FORWARD Belt Fasteners for my (Big Six) Motor Cycle Combination. Up to that time I had tried almost every make of fastener, but every one failed. Almost every time I went out I broke a fastener, and I got downright sick of it. So you will understand how pleased I am to say that since I put in your Forward I have never had a break."

If you want a cheaper but excellent Fastener, there is

THE KING HOOK.

Price 1/- or adjustable 1/3.

FORWARD SPARKING PLUG Co., SUMMER ROW, BIRMINGHAM.

Easter, 1919.

THIS is the season when all keen motor cyclists attend well-known rendezvous, and find great interest in examining the new machines of their fellow enthusiasts. Before the war Easter could be regarded as a time when most of the new models would be in the hands of the public, but this year, we are afraid, very few new designs will be found at such meeting places on the road. The few entirely new designs produced since the Armistice are rare, and new machines are confined to those makes in which pre-war design predominate.

However, there will be no lack of interest among motor cyclists, and no doubt every new looking machine will be keenly scanned for new fittings and improved details, while makers' samples not yet in the public's hands will be watched for near every centre where motor cycles are made. This Easter also opens the post-war competitions, and it is anticipated that quite a number of riders will congregate at various points on the courses where the trials are being held.

The State of the Roads.

AS touring by motor cycle is likely to begin again in earnest at Easter, a few words as to the state of the roads may be of use to those who propose to go into districts with which they are not fully acquainted. We have from week to week been publishing information as to the present state of the roads of Great Britain, many of which have been rendered more or less impassable by the war traffic. Shortly, it will be best to avoid those districts where large camps or aerodromes have been situated, and generally those in which much munition work has taken place. Thus, in the Salisbury and Blandford districts the roads will be found to be in very poor condition. The county of Kent, too, has suffered in spite of the pre-war excellence of its roads. The coast road from Sandwich, through Deal to Dover, to

Folkestone and thence inland more than half the way to Canterbury, is in a very bad state, as are also the road from New Romney to Ashford and the first half of that between Canterbury and Margate.

In the London district many of the main roads leading into different parts of the country are much cut up; the roads through Watford, Uxbridge, Ascot, Dartford, Bromley-Westernham, and Warrington being notable examples. Other roads in this district which should be avoided are those from Guildford to Ash, Reading to Riseley, and Wokingham through Arborfield Cross to Eversley.

Oxfordshire abounds in bad roads at the present time, especially in the neighbourhood of the university city and from Faringdon to Wantage. Herefordshire has suffered much from the haulage of timber and other heavy traffic. Riders bound for West Cornwall are, after leaving Launceston, advised to make their way through Camelford and Wadebridge instead of over Bodmin Moors. On the South Coast a bad stretch will be found between Lewes and Eastbourne. The Welsh coast, too, has suffered.

The Mudguarding Problem.

WHEN the middle of April is reached, the question of mudguarding as a rule is laid for a while upon the shelf, but as we write, the weather is like November rather than spring, and we publish in our Correspondence columns a further appeal to manufacturers to give more attention to this important subject. We wish to second this appeal to the best of our ability, therefore we make no apology for referring time after time to this question. Mud is thrown up by the front wheel, and, before it can fall to the ground, the motor cycle overtakes it and, consequently, both machine and rider become very dirty unless means are taken to intercept the mud. Surely, the brains devoted to motor cycle design can provide something efficient and not unsightly.

IDEAS: Useful and Ingenious.

Sydney R. Jones

A Valve-grinding Device.

MR. J. F. T. CRIDLAND, a Forest Hill reader, sends us a sketch of an accessory he has made and found useful in regrinding and truing up the valves of a 2½ h.p. Douglas, but which can be adapted for any valve. As will

An easily-made device for truing up valve faces.

be seen from the drawing, the base of the device is a 1in. board, 8in. x 4in., bevelled on one side to 45°. Two clips for the file are secured to the top surface, and are made of ¼in. steel ¾in. wide, and a clamp and V bearing for the valve are constructed of sheet steel 1in. wide and ¼in. and ½in. thick respectively. The file used is a 6in. dead smooth, and the valve face is rotated against it by means of a brace or a screwdriver.

A Puncture-proof Tyre.

NECESSITY is truly the mother of invention, and the patented puncture-preventer illustrated below is no exception to the rule. Mr. W. A. Rothwell, the patentee, had great trouble

A puncture-preventing device.

with the tyres on his 2½ h.p. twin Enfield during duties at aeroplane factories, where nails and such things, so detrimental to tyres, are lying about in abundance. The idea occurred to Mr. Rothwell to utilise a length of thin spring steel, similar to that used as springs for gramophones and clocks, which he securely stitched between two lengths of stout canvas. This band was then placed

Readers of "The Motor Cycle" are invited to contribute to this page any ideas successfully adapted to their motor cycles. Contributions will be paid for at our usual rates. Rough sketches will suffice

between the cover and the tube, and after 3,000 miles he tells us that he found no retarding effects, and had no punctures. He has, therefore, protected the idea, with a view to marketing bands suitable for all sizes of pneumatic tyres.

A Locking Device.

IN view of the numerous thefts of motor cycles, the locking device illustrated may be of some value to motor cyclists who have frequently to leave their machines unattended. A hinge on which a padlock can be

Fastening the gear lever into neutral position.

A stirrup locking device.

locked holds securely the change-speed lever in neutral position.

Another device that has been found serviceable is the use of a stirrup similar to those used in the Army to lock kitbags.

Easily-operated Rear Stand.

THE stand illustrated herewith has been protected by Mr. A. S. Bryer, of Southampton, and has for its object the elimination of strain on the part of the motor cyclist in raising his machine on to the stand.

Mr. Bryer's stand has two legs and a connecting bar of the usual type, and around the latter rotates a sleeve, to one end of which is fixed a foot lever.

The lever lies parallel and close to the inner face of the leg when not in use, and the end has two laterally projecting lugs, extending one each side of the leg. Similar lugs are also fitted at the other end of the sleeve.

When it is desired to "raise" the machine on its stand, the pedal lever is moved outward until the lugs at each end of the sleeve engage the legs. The pedal lever is now at an angle of approximately 80° to the leg.

Moderate pressure of the foot is sufficient to raise the rear of the machine

The rider holds the saddle or carrier of the cycle, and by pressing upon the pedal the machine is raised until the stand assumes its supporting position. On the rider withdrawing his foot, the lever returns, by the aid of a spring, to its normal position.

Jacking the Sidecar.

THE provision of a sidecar jack or stand is claiming the attention of some makers, but the majority still allow the raising of the cycle on its stand to throw the sidecar over at an angle, thus setting up unnecessary strain at the lugs.

The following suggestion would facilitate the raising of the sidecar without undue exertion. A straight tube may be pivoted to the axle between the spring and the wheel, or in any other convenient position; the rear end should have a

A suggested sidecar stand.

roller or wheel, and the operating end could be finished with a handle-bar grip.

The only movement necessary to lift the sidecar is the pulling up of the lever to a vertical position.—F.A.S.

Honour to Whom Honour.

WHILE everybody is talking big about "mass production" and the "lessons of aero engine practice," I think we are in some danger of forgetting two firms to whom the industry owes a debt which is unforgettable. I refer primarily to the Triumph Co., who in my opinion rescued motor cycling from a slump due to bad design, which threatened to engulf it a few years ago; and, secondly, to the Douglas Co., whose perseverance made the flat twin a practicable machine. I am old enough to remember how two separate firms tried to make a job of the flat twin, and after struggling along in obscurity for a season or two surrendered. Then the Douglas people, who were then best known as makers of shoe trade machinery, took up the old Barter and Fairy patents on sound engineering lines and with the essential capital, with the result that the flat twin now challenges the once monarchic single. Probably this paragraph of mine is quite unnecessary. Both of these firms are slow of speech. They are more prone to perform than to promise. Neither of them has yet whispered to the public of anything but W.D. models. I expect each factory has a rod in pickle for those audacious mushroom firms which are plunging into mass production. Personally, I hope to welcome something of real interest from both concerns.

Dirty Wheels.

IF flesh could crystallise (pardon "fatigue") as metal does from over-exertion, many motor cyclists' tongues would long since have dropped off as the result of denouncing the 1914 machine for its dirt-collecting propensities. It is odd that, though we hear so much about mud traps on the crank case, rust traps on the handle-bar, oil and dust traps on the tank top, police traps on the road, so few people ever mention the propensity of wire wheels for catching and holding dirt, or the difficulty of cleaning these parts. I suppose we are sunk in a sullen despair, knowing that windage practically puts the disc wheel out of court for serious riding. I should be very sorry to say good-bye to the wire wheel for some reasons; it is the only part of the average machine which has a delicate and fairy appearance: and a speedster should not look too lumpish. The wire wheel is elastic to a certain degree, and so makes for comfort: it is cheap to make, and easy to repair, unless, of course, you throw it under a traction engine, or bend it into a true lover's knot by ramming walls with it. But it is a beast to clean. Do not mistake me. I never clean my machines. I coat them with vaseline on delivery, and when selling day comes, one good wipe over brings away the vaseline plus the filth of ten thousand miles. But saner owners, I am credibly

informed, spend an hour each evening going over their 'buses with metal polish. Moreover, the general public considers motor cycling a filthy pastime, and countenances speed limits and police traps because it sees us careering about with mud on our spokes, which is far worse than a Bacchante with vine leaves in her hair. So—strictly *pro bono publico*—I plead for a pressed metal artillery wheel, which shall be light, strong, resilient, and easily cleaned. In Mr. Sankey's ear I breathe interrogatively the one word—"Duralumin"?

The New and the Old.

AS one of the very few riders who have sampled both the old 1914 A.B.C. (500 c.c.) and the new 1919 400 c.c. pattern, I am glad to give my testimony that the new-comer will do practically everything that its papa was capable of. With the possible exception of the four-cylinder Henderson, I do not expect to taste better acceleration than the 1914 model gave on second gear uphill: but the 1919 model has a better jump on the higher gears. The steering of the little one is perceptibly the better of the two; but I still have a weak corner in my heart for the springing of the old 'nn.

"Lightweight" Bicycles.

WE have frequently wandered into confusion in respect of lightweights. I have often suggested that the term "light" in reference to a car does not necessarily convey any particular information about its weight (or, for the matter of that, its price, as was once implied); a light car in 1918 meant a car with a smallish engine: by 1920 it may only mean a car that has a smaller engine than your pre-war car, which may have been of 40 b.h.p. So too in motor cycles. At one time a "lightweight" motor cycle was a machine which was catalogued at or near 100 lb. To-day it means a cycle which has an engine of less than 400 c.c. but which may tip the scale at 2½ cwt. This is simply ridiculous. In the so-called light car world, the real objective of classification is initial cost and running cost. Whatever term is used for the "juniors" and the "junissimuses" (I am an old man and have forgotten my Latin) should guarantee that the car so christened is cheapish to buy and very cheap to run. In the sphere of lightweight motor bicycles, price is not the main objective. If some stout old party who has not viewed his toe-caps for years hears a cycle described as a lightweight, it is weight which is his primary interest. He wants to be sure that he will not have an apoplectic stroke when he has to hoike the carrier backwards to get the machine on its stand. He may have no ambition to carry it up steps, but at least he will be depressed if it pushes

Occasional Comments,—

him over on his back when he rashly lets it lean against him. At present, press, trade, clubs, and enthusiastic conversationalists befog this sporting old party quite hopelessly. For when Jones brags that his "lightweight" can be kept on the mantelpiece, he is talking of a Levis Popular, weight 110 lb.: and when Brown talks of "lightweight," he is describing deeds of derring-do on a 1920 'bus with spring frame, lighting dynamo, and Zeppelin-aluminium-girder sidecar, weight 5 cwt. all on. I am not so crazy as to suggest that low weight is the Alpha and Omega of a "lightweight." Comfort, hill-climbing, reliability, and cost are all factors in the demand. But the term is grossly misapplied at the present time; and when so many slim girls and impoverished elderly papas with equators are nibbling at our hobby, it is time we became more precise in our diction.

The Cheapest Sidecar Outfit.

ONE or two correspondents have written to ask me what is the cheapest bargain in the way of a sidecar outfit during the present epidemic of famine prices. The answer must vary with three factors, viz., the exact sum available, the nature of the local hills, and the degree of luck encountered in spotting what one is seeking. Broadly speaking, a

fair fun is obtainable. Next to the twin I should place the chain-driven single-cylinder, which is also rather a rarity at a low price: three-speed belt-drivers with hub gears are neither very scarce nor very dear, but if a skilled overhaul of the hub can be managed, the ensuing season should be free from transmission troubles of a serious character, unless bad hills and bad weather are met in combination. It is better to be lucky than rich, and some persevering buyers with shallow purses are unearthing sellers who are not profiteers. Really, the whole question turns on whether the would-be buyer is ready to put his pride in his pocket. Until recent years even the knut had to tour either with a three-speed hub and belt drive, which gave trouble at regular intervals, or with a single-gear belt. We were not particular. We wanted to take our girls about with us, and we took them. What matter if wisdom bade us dodge certain hills at any time—rush another up to the sticking point with passenger, descend, and rush to where the passenger had tramped and was ready to help in the push—always feel if the belt punch and knife were in our pockets—and so on? We thoroughly enjoyed these quaint, primitive, strenuous tours. If the money does not run to a slap-up £130 6 h.p. combination with dynamo and three speeds, why not take the best you can afford and use it? I'll be bound

this coming summer will resurrect a lot of old corks, and that their users will enjoy the fun of tuning them up and coaxing them to achieve miracles. One of the merriest souls I know used to drive a high compression T.T. 6 h.p. twin, single gear, belt drive, and sidecar. He was not blessed with a stout wife, and they did not take evening dress with them, but they had some exceedingly good times together.

TESTING THE 8 H.P. BLACKBURNE

Negotiating sharp and steep turnings into the Churt road. (See page 381.)

low-gear gear-boxless twin is the best bargain in this line for a poor man; if the average pace is kept down, a big twin will stand quite a low gear, and if opened up from cool will do some wonderful climbing on a single gear. A chain-driven is preferable in view of wet weather, but if two belts, as wide as the pulleys can take them, are carried, very

A Road Test of the New 8 H.P. Blackburne

A Strenuous Test in the Hindhead District.

ONE day last week, on a very faint line, Mr. J. S. Holroyd was heard to inform us that the new 1919 8 h.p. Blackburne sidecar combination was ready for the road, and, beyond hearing something to the effect that he would like us to come and see him try to break it up, little more could be heard. We arrived by road the next morning, and found the new Blackburne quite ready for the trip. The outfit had only just been completed, and all it had had in the way of a test was a run to Gosport and back to Tongham. So far as the motor bicycle is concerned, it is similar in many details to the 4 h.p. we recently described, except that the engine is a 60° 85 mm. x 88 mm. 998 c.c. twin, with detachable and interchangeable cylinder heads, and that most noteworthy of all Blackburne features—an outside flywheel.

Particular attention has been paid to the silencing of the engine, both as regards the exhaust and also as regards noises from the valves and timing gear, and considerable success has been attained in this direction.

We left the works in the luxurious sidecar with the designer at the helm, followed by another Blackburne driven by one of the directors, Mr. Cole, while *The Motor Cycle* photographer brought up the rear on his Matchless, with Mr. Reeves, another director, as his passenger. From Tongham we made our way along bumpy roads, which brought us eventually to Elstead. From here we proceeded in the direction of Churt until we reached a pretty spot where a steep, rough, and narrow track, obviously not meant for wheeled traffic, descended into the valley. Here we made a brief halt to take photographs, and then the day's work really began. It is not our usual custom to go out on a trial run and leave the manufacturer or his

representative to choose the course, but on this occasion the matter was taken out of our hands, and no one except our pilot knew whither we were bound. In a few minutes we were in a part of Surrey the nature of which could never be guessed: a wild district of unsurpassable beauty, unsullied by signs of human habitation, and devoid of all roads. True, there were tracks, and these were similar to the mule paths that exist in the Vosges and other mountainous districts. Our descent was down one of these steep tracks. The surface was sandy and intersected by ruts, gulleys, roots of trees, and great stones, the avoiding of which (when possible) called for every atom of skill the driver possessed. Such surfaces excited rebellion in the hearts of certain competitors in the 1914 Six Days

Trials, yet they are of a kind met with in our Overseas Dominions, and it is for these countries that so many British motor cycles are required. Messrs. Burney and Blackburne realise this, and their products have the high ground clearance, the 28 in. wheels, and the power to combat these conditions. The top gear ratio, we may mention, was $4\frac{1}{4}$ to 1.

When once the stretch of wild country was entered we stopped, and it was decided to make a round of the course first so that we might choose the spots where the best views might be taken, but the photographer misunderstood instructions and dashed on

ahead, much to Mr. Holroyd's consternation, as the road was really dangerous, but he stuck in the sand at the critical point and had to come back. It now came the turn of the new Blackburne, and we charged up the hill over a surface similar to that described above on to a gradient of about 1 in 5. Just short of the summit the combination almost came to a standstill owing to back wheel slip, but heeling over to a dangerously

The Blackburne flywheel is secured by a taper and key, locked on by a nut, over which a cap is fitted.

A Road Test of the New 8 h.p. Blackburne.—

steep angle, so abruptly did the track slope away, and with a veritable precipice on the left, the engine gallantly stuck to its work and surmounted the gradient. The track now became less steep, but no better as regards surface; notwithstanding, Holroyd changed into second, climbed a short steep pitch, and then, to our amazement, left the track, slewed round to the right, and charged up the hill over the gorse.

As we anticipated it would, the engine resented this treatment and stopped, but Holroyd was much surprised till he discovered he *had omitted to change down to first speed*. This was a fault which was soon remedied, and we were again tackling the slope. A glorious view unfolded itself, but for the moment we were occupied in regarding the hollows, bumps, and ridges which were wringing and straining the sidecar frame, but nothing happened. The Blackburne did all that it was asked to do, and did it well, and part of it over a track which no car, not even a Ford, could have negotiated owing to its narrowness. Most of the course was done again, and done even better for the benefit of the photographer, and then the real test finished up with a genuine "freak" hill-

climb. The surface was as before, the gradient 1 in 4 or worse; the power was there but adhesion failed, and a boulder blocked the way, so what would you?

It was a wonderful performance over a course of Mr. Holroyd's own choosing, and not one we should have selected ourselves. Resuming normal conditions we took the helm and returned to Tongham through Tilford and across the Hog's Back. This gave us the opportunity of appreciating the new Blackburne's good qualities to the full. We found the engine to be beautifully balanced, and its smooth and silent running appealed to us most strongly. The engine possesses wonderful powers of picking up speed on a gradient without change of gear; this is clearly due to the outside flywheel, which enables power to be maintained at slow speeds, while the fact that there are no internal flywheels retarded by the viscosity of the oil clearly adds to the efficiency of the engine. We are

left with the impression that the new Blackburne has made good, and will be a mount which will be much sought after not only in this country but in the Colonies, and will go far towards recapturing the trade, which, owing to the war, has been allowed to slip into allied but foreign hands.

(Top) Rear view of the Blackburne outfit. The width of the mudguards is a commendable feature. The two lower photographs give a good idea of the wild nature of the country that was traversed.

THE LONDON-EDINBURGH.

THE Motor Cycle Club has decided to hold a speed-judging competition on May 10th, and a petrol consumption trial early in June. The London-Edinburgh run, which was last held in 1914, will be resumed this year at Whitsuntide. The start from London will be on the Friday night prior to the

Whit-Monday, and the return journey from Edinburgh on the Monday, starting Sunday midnight.

The usual prizes will be awarded—gold medals within 22¼ hours, silver within 24 hours, and bronze within 30 hours. From what we hear, the event will be well supported.

A Remarkable System of Engine Construction.

All Main Parts built up from Stamped Steel Sheet.

A SYSTEM of engine construction which, if it proved to be successful, should be almost revolutionary in its results has been patented by Mr. A. W. Wall, of Sheldon, near Birmingham, who will be well-known to our readers as the designer of the Wall Auto-wheel, Roc gear, etc.

Only after some difficulty have we persuaded Mr. Wall, and those associated with him in this project, to give us permission to make some reference to the system, beyond a review of the number of patent specifications which have just been issued in regard to it, but which do not show the most recent applications of the principle. There is no desire on the part of its sponsors for premature publicity, but, as a matter of interest to our readers, we have obtained permission to give a few explanatory particulars.

Briefly, the idea is to build up the engine—that is, the cylinders, cylinder head, crank case, crankshaft, pistons, connecting rod, and other parts—from units formed by stamping steel sheets. A four-cylinder motor cycle engine, in addition to a car engine, is in course of construction, and we have inspected various finished parts, including the unit consisting of cylinder jackets and crank case. In regard to this main unit, it is formed of two stampings, which are bolted together at the vertical and longitudinal centre line. Each half is an exact duplicate of the other, and the only machining necessary before they are brought together is a grinding process which allows their contact faces to meet firmly all over. Grooves for oilproof packing and for direct oilways to the bearings are formed with the stamping.

Poppet or Sleeve Valve.

Into this shell are pressed the actual cylinder barrels consisting of steel tubes. When the engine is to be water-cooled, the jackets are also of sheet steel, pressed on to the cylinder casing, and water joints are formed at the lower ends by means of grooves in which packing material is inserted under pressure.

An air-cooled engine has its cooling fins similarly pressed on, and is naturally a simpler proposition.

Detachable heads occur in both types, and provision is made for sparking plugs, valve seats, valve guides, and other details when a poppet valve engine is in question.

The four-cylinder motor cycle engine now being made is of the four-stroke type, but two-stroke and sleeve valve engines are also in hand so far as designs are concerned.

The crankshaft is particularly interesting. The journals and crank pins are formed by stamping a long spigot, in the centre for the journals and eccentrically for the pins, from each of several flat steel discs. Two opposed units, with spigots which telescope one within the other, constitute each journal or pin, and the two and also one disc of the next

unit are held together by, roughly speaking, burring over the ends of the spigots. Provision is made for preventing rotational movement between the telescoped parts, otherwise, of course, the shaft as a whole would be twisted all shapes by the torque it must convey to the flywheel.

The connecting rod bearings, of the roller variety, are put in position between the telescoping parts during the course of erection.

The advantages claimed for this form of construction are many, among them being extremely low cost, very light weight, unusual strength, and suitability for mass production. As to the practicability of the scheme, those who have associated themselves with Mr. Wall first obtained a considered opinion from one of the best known consulting engineers in the motor industry, and the favourable views that gentleman expressed convinced Mr. Wall's colleagues that the proposal was feasible and practicable.

Some thousands of pounds have already been spent in making the necessary dies and tools, for a sample engine could only be built after an equipment suitable for quantity production had been obtained.

Section of the built-up crankshaft.

THE PEACE MODEL RUDGE-MULTI.

Modifications and Improvements in a Well-ried Design.

LIKE most of the large motor cycle manufacturers, Messrs. Rudge-Whitworth, Ltd., have taken some time to clear their factory of Government orders before resuming the production of motor cycles. Arrangements are now complete, however, for a fair output of the Multi model, which, as many of our readers are aware, won the last T.T. race.

The 1919 Rudge Multi can be said to be an improved pre-war model, modified in details, but not differing to any large extent from its predecessor. The main alteration is the new crank case, which now has smooth surfaces, all projecting ridges, with which in previous models

A crank case with a clean exterior is one of the improvements of the 1919 Rudge.

the crank case was ornamented, having been removed. This has a distinct advantage, as it is much easier to clean, and does not collect mud, as do many crank cases having rings cast upon them. The timing case cover, too, has a smooth face.

As of old, the engine has a bore and stroke of 85 mm. and 88 mm. respectively, and an overhead inlet valve actuated by push rod operated by a cam on the last of a train of gears, from one of which the magneto is driven.

There is another point where the Rudge engine differs from the majority. The pinion for driving the half-time gear has a vernier adjustment. The driving pinion has twenty-two teeth, and is fixed to the crankshaft, having twenty-one serrations. This, multiplied by two for the half-time gear, gives a vernier adjustment for timing the valves with a movement of less than one-half a degree at a time. The reader may work this out for himself as follows

$$\frac{22 \times 21 \times 2}{360} = \frac{1}{924} \text{ (part of a circle)} \\ = .388 \text{ of a degree}$$

An interesting feature of the Rudge machine, and one which is appreciated by many riders, is the method of carrying the lubricating oil and operating the pump. The oil tank is a separate unit clipped to the "seat" tube of the frame, and has a pump fitted in its lower end which is operated, through a Bowden wire, by a pedal near the right footrest. This ensures a petrol tank free from oil always.

The Rudge sidecar is a particularly fine piece of work, and is larger all round than the pre-war model. The nose has been broadened considerably, and an adjustable footboard fitted.

Both cushion and back cushions are unusually deep and well sprung, and the height of the seat from the floor is higher than in the majority of sidecars, as will be seen from the accompanying photograph.

In addition to the usual locker under the seat there is a capacious compartment between the rear panel and the seat back.

A grid with accommodation for two petrol cans is supported on a sub-frame which is carried by the two cross members upon which the body also rests. The grid is therefore sprung with the body, although the latter does not support the weight.

As regards the finish, this is as good as any, and far better than most sidecars we have seen. The top panel is of polished aluminium.

The rear locker and grid. The latter is carried on the sprung portion of the sidecar.

650 x 65 mm. tyres are fitted to both machine and sidecar, the prices of which are £80 and £30 respectively.

The 1919 Rudge sidecar, which has a larger and wider body than its predecessor.

THE REX SIDECAR SINGLE.

84½ mm. Bore, 98 mm. Stroke, 550 c.c.
Capacity, Mechanical Lubrication.

The new Rex, which will be known as Model 77, primarily designed for sidecar work.

ENTIRELY new models have been few and far between, many 1919 models being war-time designs improved in detail. So far as singles are concerned, it is about five years since an entirely new design was introduced. Therefore, the Rex 4 h.p. sidecar single undoubtedly will create a great deal of attention on this score alone. On two other counts this machine is particularly interesting. First, it is the latest model of a firm which has been associated with the motor cycle industry since its earliest days; and, secondly, the design is interesting in itself, both as regards the engine and the machine generally.

The latest Rex is essentially a sidecar machine. It has been designed throughout for passenger work, and is, consequently, heavier than most machines of the same capacity which are designed as dual purpose mounts. The requirements of the Overseas markets, too, have been borne in mind, hence the American type rims and 28 x 2½ in. tyres.

The Engine.

In design the power unit departs from the average single-cylinder motor cycle engine in at least one important point, i.e., the lubrication system. The crank case is in three main parts, two sides, and a base. The latter forms the bottom of the crank case, and also embodies a large oil sump extending forward to form the platform for the magneto.

On the left side of this sump is the oil filler, which has a screw needle for ascertaining the amount of oil in the sump.

From the sump the oil is circulated by a small gear pump on the right side of the unit, through an adjustable sight-feed on the tank, to a union on the crank case, which communicates with a circular channel, from which it overflows into a second channel, of which the base of the cylinder barrel forms the inner wall. In the latter are several holes for the entrance of the oil into the engine proper, from which the piston also takes its allowance.

The residue is constantly dripping into the base of the crank case, where it is maintained at a certain level for splash lubrication, after which it drains back to the sump *via* three holes in each side wall. These holes also serve automatically to provide more oil when the machine is going uphill, as, when the machine assumes certain angles, these overflow ports one by one go out of operation, and in consequence a greater depth of oil is accumulated.

In addition to the mechanical oiling system, there is an auxiliary hand pump which can be used to give the engine an extra charge of oil from the tank if or as required. The pump is on the side of the tank, and placed much further to the rear than is usual. Thus the Rex engine has two distinct oiling systems.

Timing gear of the Rex engine, showing the decompressor mechanism.

The cylinder has a bore and stroke of 84½ mm. and 98 mm. respectively, the capacity being 550 c.c. There appears to be ample radiating surface on the fins, which, along the side of the valve pockets, are cast straight instead of following a more or less circular contour; and between the valve pockets and the cylinder there is a clear air passage.

Side-by-side valves are used, operated by a single cam—in fact, one cam serves for inlet and exhaust valves and the decompressor.

The Decompressor.

The latter mechanism consists of a finger carried on a sleeve, which is mounted eccentrically on a shaft, to which the operating lever is fixed. Connected to the sleeve is an arm extending to an auxiliary rocker integral with the exhaust valve rocker proper, but is not connected directly to it. The auxiliary rocker has a stud fitting in a slot in the arm. Therefore, when the decompressor lever is so moved that the finger gets into the path of the cam, it partly rotates the sleeve and brings the stud to the end of the slot and so raises the exhaust valve during a portion of the compression stroke.

A single shaft, placed centrally, is used to carry the rockers, and the cam wheel is off the centre line. The other gear wheel in the timing case is for the purpose of driving the oil pump. There is a worm on the shaft of this latter gear, which drives a phosphor bronze wheel on the short shaft rotating the gear of the pump. This latter is a neat little device, consisting of two spur wheels in a small brass case, which can be completely disconnected by removing the union and six screws, without disturbing the timing case cover or any other part of the engine.

Aluminium Piston.

It is extremely interesting to note that the makers of the new Rex are pinning their faith to an aluminium alloy

The Rex Sidecar Single.—

piston. This is the subject of one of the several patents about the machine, and weighs threequarters of a pound, or about half the weight of a cast iron piston of the same size. As will be seen from one of the accompanying drawings, the piston is of the lantern type, while closer examination will show that two of the three rings are of unconventional section.

The designer has aimed at obviating direct contact between the aluminium piston and the cylinder wall, and this is attained by the L section rings shown. Neither the top nor the bottom of the piston can touch the cylinder walls, as

each end of the piston is cut away and the space filled by the ring. A groove is cut in these rings to distribute the oil along the path of the piston and to remove the surplus. A third ring below the top ring is fitted, and, like the others, it is $\frac{1}{4}$ in. wide.

The gudgeon pin works directly in the aluminium bosses of the piston, the small end being split and gripping the pin by means of a

The steering head, showing the method of lubricating the ball races, and the cone fixing for the handle-bar.

nut and bolt. A large bearing surface is obtained in this way, and we may say we have examined a piston which has done over 2,000 miles, and no appreciable signs of wear were apparent.

A double row roller bearing is used in the big end of the connecting rod, which is particularly light. The main shafts

The brake pedal is well supported on a long oil-bearing, which has a large lubricator.

Lubricator to supply oil to the ball bearing supporting the belt rim.

The rear brake, which has a parallel motion. The brake spring is enclosed.

The handle-bar lug, which permits the bar to be adjusted as to height.

are supported on large ball bearings with an extra bearing of the roller type on the driving side.

The wheels are of the quick detachable type with knock-out spindles, and are interchangeable, the pulley wheel, which is carried on a separate ball bearing, remaining in the frame. As will be seen from the drawing of the head, the lower ball race has a proper oil channel leading directly to it from a large lubricator in front of the head, while the top ball race is lubricated through oilways drilled at an angle from four holes, which are used also for adjusting the head. These holes are covered by a sliding ring.

Adjustable Handle-bars.

An adjustable handle-bar is another feature of the design; the bar, being gripped by a split lug, may be raised or lowered as desired by slackening two nuts. The other part of this lug fits on the steering head over a long tapered member having a key, and is held in position by a large "nut" having an extension for accommodating the lamp bracket.

Brampton Bi-flex forks are fitted, with a good size mud-guard and a front wheel stand. The front brakes are of the conventional type, but the wheel is rendered accessible by the brake shoes being so made that they can be swung round by loosening the two nuts which secure them to the stirrup.

The frame design departs from past and present practice. The top tube slopes to the rear but towards the rear end it is bent. From this tube the canti-

The drilled connecting rod and aluminium piston. The latter is fitted with three $\frac{1}{4}$ in. rings, two of which are stepped and have scraper grooves.

lever member of the saddle suspension is pivoted. The four sidecar lugs are integral with the frame, and the carrier member embodies a large metal tool box, which forms part of the rear guard. By removing four nuts this unit, consisting of carrier, tool box, and rear portion of the guard, may readily be removed.

Parallel Motion Rear Brake.

The rear brake has a parallel motion, and the fibre pad works inside the V of the belt rim. This brake is operated by a pedal, and is the only control at the driver's feet, all others being hand-operated.

On the left handle-bar there are the exhaust valve lifter and clutch levers, and on the right the front brake and carburettor controls. The magneto advance and retard lever is, perhaps, the largest we have seen on a motor cycle. This is located on the left side of the tank.

The finish of the machine is in black enamel, with very few plated parts, the handle-bars being finished by a new process, which renders the metal a dull black finish, somewhat similar to what is known as "gun finish." The tank is black and gold, with a manne panel.

A Sturmey-Archer three-speed gear box gives ratios of 5.2, 8.3, and 13.6 to 1.

The proposed price of the machine without sidecar is £32 10s.

The crank case and oil sump. The oil sump filler and level indicator needle are shown on the left.

Club News

N.M.C.F.U. (Leicester).

This branch of the Fuel Union will meet at 10 a.m. on the 20th inst. for the run to Stratford-on-Avon. Hon. sec., Mr. F. J. Underwood, 272, Humberstone Road, Leicester.

N.M.C.F.U. (Birmingham).

The Birmingham branch of the N.M.C.F.U. will meet on the 20th, for the inter-meet at Stratford, at Saracen's Head, Shirley, at 11 a.m. and 2 p.m. On Easter Monday there will be a picnic run to Badby Wood.

N.M.C.F.U. (Coventry).

For the run to Stratford-on-Avon for the national meet, the members will meet on the 20th inst. on the Common, Warwick Road, at 10.30 a.m. and 1.30 p.m.

N.M.C.F.U. (London).

Members of the London branch are asked to rally for the national inter-meet at Stratford-on-Avon, and those intending to participate in the run should communicate with the local hon. secs., Messrs. J. J. Moon, 1, Hunter Street, Russel Square, and L. A. Langford, c/o Messrs. J. A. Prestwich and Co.

Eastern Counties M.C.

The opening run of the Eastern Counties M.C. was to the "Bull and Horse-shoes," Harlow, and was a very pleasant and sociable gathering. Several of the members were in khaki, and new members were introduced. Over forty members turned out.

Ilkeston and District M.C.C.

The fixtures for the above club include a run to Skegness on the 18th inst., and to Ashbourne on the 21st. The club is affiliated to the A.C.U., and interested motor cyclists should communicate with the hon. secretary, Mr. A. Checkland, 106, Bath Street, Ilkeston.

Banbury and District M.C.C.

At an extraordinary general meeting of the Banbury and District M.C.C. it was decided to carry on the club as in 1914 with all available officials and committee. Vacancies due to the war were filled. The club's programme for 1919 is to foster the social side of motor cycling, and a few sporting events, such as a hill-climb, reliability trial, old crocks' trial, etc. Affiliation to the A.C.U. has been continued, and any motor cyclist residing in the Banbury district is invited to become a member. The opening run will be to Stratford-on-Avon on the 18th inst., meeting at headquarters at 12.30 p.m. Tea at Unicorn Hotel, Stratford, at 4 p.m. Hon. sec., Mr. H. A. Beard, 4, Horse Fair, Banbury.

Future Events.

- April 17.—Newcastle-on-Tyne M.C. Opening Run to Allendale.
 April 18.—Banbury and District M.C.C. Opening Run to Stratford-on-Avon.
 April 18.—Ilkeston and District M.C.C. Run to Skegness.
 April 18.—Middlesbrough and District M.C.C. Richmond Meet.
 April 18.—York and District M.C. Run to Richmond.
 April 19.—N.M.C.F.U., Sheffield. Run to Stratford-on-Avon for National Meet of N.M.C.F.U. on April 20th.
 April 20.—N.M.C.F.U. National Meet at Stratford-on-Avon.
 April 20.—N.M.C.F.U., Leicester. Run to Stratford-on-Avon.
 April 20.—N.M.C.F.U., Newcastle-on-Tyne. Run to Alston.
 April 20.—Troedyrhiw and District M.C. Opening Run to Porthcawl.
 April 21.—Birmingham M.C.C. Open Reliability Trial for Victory Cup.
 April 21.—Dublin M.C.C. Dunlop Cup Trial.
 April 21.—Ilkeston and District M.C.C. Run to Ashborne.
 April 21.—N.M.C.F.U., Birmingham. Picnic Run to Badby Woods.
 April 21.—Widnes M.C.C. Opening Run to Llangollen.
 April 21.—York and District M.C. Run to Fountains Abbey.
 April 26.—Public Schools M.C.C. Hill-climb.
 April 26.—Ystalyfera and Swansea Valley M.C.C. Hill-climb.
 April 28.—Edinburgh and District M.C. Open Reliability Trial.
 May 4.—Bolton and District M.C. Reliability Trial.
 May 4.—N.M.C.F.U., Sheffield. Reliability Run to Knutsford.
 May 10.—The M.C.C. Speed-judging Competition.
 May 21.—York and District M.C. Reliability Trial.
 May 24.—Birmingham M.C.C. Social Touring Trial. Week-end to Llangollen.
 June 6.—M.C.C. London-Edinburgh Run.
 August.—A.C.U. Six Days Reliability Trials.

Middlesbrough and District M.C.C.

The opening run of this club is fixed for the 18th inst., when the members will hold their Richmond meet, as in pre-war days. A very comprehensive programme has been drawn up for the year, including a hundred miles reliability trial in May. The hon. secs. are Messrs. C. C. Close and S. G. Randall, 5, Oxford Road, Middlesbrough.

Cumberland County M.C.C.

A large gathering of motor cyclists assembled for the annual meeting of the Cumberland County Motor Cycling Club, which was held at the headquarters, Carlisle. Rule 16, which debarred trade members from serving on the committee, was deleted. Mr. T. H. Daykin, 55, Etterby Street, Stanwix, Carlisle, was appointed secretary, and Mr. A. J. Hunt, Lonsdale Street, Carlisle, treasurer. It is intended to hold a concert and opening run at Easter.

Aberdare and District M.C.C.

At a meeting of the Aberdare and District Motor Club it was decided that the club be carried on as usual this year. It was resolved to become affiliated to the Auto Cycle Union as in previous years, and that the terms for membership should be as heretofore.

The members of the club are only too pleased to render any assistance to members of the A.C.U. who may be passing through Aberdare upon their writing to the secretary, Mr. A. J. Charles, 4, Tanybryn Street, Aberdare.

The Public Schools M.C.C.

A hill-climb for members of the Public Schools M.C.C. will be held on Saturday, the 26th inst. Members are to meet at the Rose and Crown Hotel, Tring, lunch will be served at 1 p.m., and a start for the hill will be made at 2 p.m. The cost of entry is 5s., and entries should be forwarded to the hon. sec., Lt. H. B. Browning, R.G.A., River Bank, Staines, as soon as possible.

There will be the usual classes, including a separate class for two-strokes if sufficient entries are received. The other classes will be: Class B., up to 350 c.c.; Class C., up to 500 c.c., including a class for sidecars; Class D., up to 750 c.c., including a class for sidecars; Class E., up to 1,000 c.c.; also a class for sidecars and three-wheelers.

A small silver cup will be awarded to the winner in each class. Competitors in this event will also gain marks for the Robinson aggregate challenge cup, a cup presented by the father of one of the members for the highest number of marks gained by any member during the year's competition.

Motor cycles must be in full touring trim, with mudguards, horn, etc., must not be stripped, and must be subject to examination. Lamps need not be carried. It has been decided to appoint representatives at the various public schools.

Members of existing public schools who are willing to act in this capacity should send in their names to the honorary secretary.

Oil in Proportion to Engine Speed and Load.

A New Throttle-controlled Oil Pump.

SINCE the majority of motor cycle engines are not fitted with mechanical oil circulation, the little pump illustrated here will undoubtedly interest most motor cyclists and many manufacturers of engines. It is manufactured by Messrs. S. A. Lamplugh, Ltd., King's Road, Tyseley, and consists of a simple form of roto plunger pump, which can be driven from the crank-shaft or the shaft on one of the timing wheels.

It will be seen that the main body of the pump consists of a circular aluminium casting, which can be fixed to the crank case or timing cover by three small screws, and has suction and delivery ports on opposite sides. In the lower part of the case there is a small gear wheel on a long spindle, supported in a bronze bush. The end of the spindle has flats cut on it to engage with a suitable slot

cut in the shaft, from which the drive is taken.

The small pinion meshes with a larger gear mounted on the rotor, the gear ratio being 8 to 1. The rotor is an annular brass ring with a groove cut round the periphery. This groove is divided into two equal sectors by fibre plugs, close to which a hole is drilled radially through the rotor. This hole forms the housing for the double-ended pump plunger, which is merely a steel spindle of a diameter equal to that of the hole and turned down to a smaller diameter in the centre to accommodate the eccentric controlling the supply. The latter is mounted on the cap of the main body, and is connected to an external lever by a steel spindle.

When the rotor revolves, carrying the plunger with it, the latter follows the contour of the eccentric, and, according to its position, the length of stroke is varied, the maximum being about $\frac{1}{16}$ in.

In action one plunger begins to suck in oil when the groove in the rim of the rotor is opposite the suction port, while the opposite end is moving outwards, and

The Bowden-controlled lever operating the eccentric for varying the stroke of the pump.

The Lamplugh throttle-controlled oil pump dismantled.

thus forcing the oil down the delivery pipe, which should be connected to the engine through a sight drip feed on the tank.

We are informed that the pump will be ready for the market in June.

Another Four-stroke Lightweight.

The 1919 Omega which is fitted with the 2 $\frac{3}{4}$ h.p. J.A.P. Engine.

BEFORE the war Omega lightweights were produced with both two and four-stroke engines, and probably the latter type was the better known. It will therefore come as no surprise that its manufacturers, Messrs. W. J. Green, Ltd., of Coventry, chose this kind of machine when they decided to concentrate upon one model for the ensuing year.

The new Omega is fitted with the latest type 2 $\frac{3}{4}$ h.p. J.A.P. engine, with the magneto in the forward position; otherwise the machine differs very little from its predecessors. 26x2 $\frac{1}{2}$ tyres are now fitted, and a two-speed countershaft gear is a standard fitment. The machine is supplied as a touring model with raised handle-bars, and as a sporting machine with semi T.T. bars.

The 1919 2 $\frac{3}{4}$ h.p. sports model Omega.

The National Meet of the N.M.C.F.U.

Rally of National Motor Cyclists' Fuel Union at Stratford-on-Avon.

THERE is every promise of a big gathering of motor cyclists at Stratford-on-Avon during the Easter holidays on the occasion of the inter-meet of the various centres of the National Motor Cyclists' Fuel Union. A good programme has been arranged by the organisers, and, although many of the branches will be in Stratford on the Saturday, the main programme is reserved for the day following.

Parties of motor cyclists are attending the meet from Portsmouth, Weymouth, Glasgow, Newcastle-on-Tyne, Sheffield, Manchester, Birmingham, Bristol, Coventry, Wolverhampton, Bedford, Nottingham, Leeds, Leicester, Lincoln, London, Derby, Liverpool, Barrow-in-Furness, Grantham, Rugby, and Ashby-de-la-Zouch; and one may regard the rally as historic, since many members are newcomers to the pastime.

The organisers announce that from 2 p.m. to 3 p.m. there will be a demonstration of the latest models. At three o'clock the visitors will assemble on the recreation ground on the riverside, where they will be addressed by the president.

At 3.30 p.m. there will be a circular run of approximately ten miles to Charlecote Park. A cinema film will be taken en route, and a prize will be awarded for the smartest turnout.

Make a Note of it !

EVERY member of the Auto-Cycle Union is entitled to have any summons arising out of the use or ownership of a private motorcycle defended in any police court in Great Britain or Ireland FREE.

The A.-C.U. provides an experienced solicitor and pays all his fees and expenses, and at any time an A.-C.U. member may obtain Free Legal Advice on any matter appertaining to motor cycling.

Trouble may overtake you to-day ! At any time you may be pulled up for exceeding a speed limit, having your number plates obliterated, or because your rear lamp has gone out—it is at such times as these that you appreciate the practical assistance provided by the A.-C.U.

10/- ANNUAL
SUBSCRIPTION

THE REX ON THE ROAD.

On Warwickshire Hills with the New Sidecar Single

WE were able to examine the new Rex machine last week, and a description with illustrations appears in this issue. After our inspection, Mr. Hemingway, the enthusiastic manager of the Rex Co., invited us to follow the tracks of the sidecar single *sans* sidecar on a two or three hour run without stopping the engine.

A suitable sidecar was not available, but since the total weight propelled by the engine was almost twice that of a single of its size with normal rider, the test promised to be interesting. We admit that we anticipated an involuntary stop through some trivial incident such as generally happens when a rider sets out to keep his engine running for a specified time. Sometimes anxiety causes these stops, the carburetter chokes, or the throttle is closed in mistake for the air lever. It is so easy to stop one's engine when the run is not straightforward and instructions may be open to misunderstanding.

ahead in order to observe the machine on the hill.

Model 77 came up steadily, on top gear, until the last portion of the stretch of 1 in 6, when the Rex man changed down to second while travelling at 27 m.p.h. Turning at the top of the hill, he immediately ran down again, and repeated the climb, with practically the same results.

Controllability and Cool Running.

What impressed us more perhaps than the climb—we were on the hill only a week before with some particularly fast machines of lighter weight—was the manner in which the rider brought his machine to a standstill, declutched, and remained seated in the saddle for the next ten minutes with his engine ticking over with the regularity of a car engine. Upon request, he demonstrated to us the revving capabilities of the engine, and, this done, throttled down again to the slow running in neutral gear, with which we were familiar before the day was done.

From Edge we wended our way along the ridge of the hill, from which such fine views of Warwickshire are obtained, to Sunrising. Here Model 77 gave another demonstration, climbing the hill twice, each climb being practically identical, the rider changing down for the last portion, and finishing the climb well over 20 m.p.h.

We then had an opportunity of seeing that the rear brake was sufficiently powerful to bring the machine quickly to a standstill on the steepest part of the hill, with the engine still running.

Some time was absorbed on the top of Sunrising, discussing the Rex and things in general, and the engine was kept running for some time, but in order to permit a closer examination of some of its features we ordered a stop for a minute or so. Here it should be mentioned the machine is fitted with aluminium footrests, which pivot on the front supports, and may be raised when desired. The back connection is by a clip.

We were soon under way again *en route* for Newnham, which lay over twenty miles away, and between the two hills the pace was hot, but the Rex went up to within a few yards of the crest on "top." A second climb was made, with similar results, and finally, the Daventry side of the hill was taken on top.

A run to Rugby, through a blinding snowstorm, concluded the test, which covered about ninety miles of hard riding. The crank case was free from oil, and to summarise our impressions, we should say that the 4 h.p. low compression Rex will be found to be a very suitable machine for sidecar work.

However, the rider of the Rex is fully justified in claiming that he did all that was required of him. True, he stopped twice—once due to a misunderstanding and not through bad driving or lack of power, and once because we wished better to examine the machine.

From Coventry we made our way, with the Model 77, as it is called, to Stoneleigh and Warwick at a fair average speed, which, but for good company and the beauty of the splendid spring morning, would have been monotonous.

After leaving Warwick, only three villages lay along the road to Edge Hill, our first objective; and, in order to warm up "seventy-seven," we made the pace a little hotter, and, by arrangement, eventually drew

Scenes on Sunrising Hill during road demonstration of the new 4 h.p. Rex motor cycle.

THE LATEST POWERPLUS INDIAN.

Side Lever for Exhaust Valve Lifter. Wires-instead of Rods for Twist Grip Control

Broadside view of the new 7 h.p. Indian sidecar outfit.

ONE of the centres of attraction at the M.C.C. opening run was the new spring frame Powerplus Indian ridden by Mr. E. Bridgman. Perhaps its most novel feature was the Splitdorf lighting dynamo, carried level with the bottom of the front mudguard and in front of the

The Indian twist grip control, showing how access is obtained to the grub screw, the removal of which allows the grip to be withdrawn.

crank case and adequately protected by an ample shield. The drive is by spring belt off the engine-shaft, and the whole of the driving mechanism is neatly enclosed. A combined volt and ammeter is attached to the top tube, and the installation comprises a side lamp for the sidecar, a tail lamp, and a head lamp containing two bulbs, one giving full light and the other for use in populous areas.

In the main, however, the new Indian has not undergone any startling alterations, but it may be mentioned that the spring frame vertical members are now of T section instead of round, while the U bracket has been reinforced. A similar procedure has been adopted as regards the front forks, the main members of which are now of heavy gauge and rounded instead of D shaped.

The engine itself has undergone little alteration, the bore and stroke being 79 and 100 mm. respectively, giving a total capacity of 980 c.c.

A new form of change-speed gate has been adopted, which is now fixed vertically at the side of the tank, and adjacent to it is a lever operating the exhaust lift. This strikes us as being quite a good idea, as it precludes the exhaust lifter being used for controlling the engine (always a bad practice), and places the device easy of access to the driver who is about to start his engine. The

Showing position of lighting dynamo in front of engine, and combined dynamo and leg shield.

carburetter and ignition controls, instead of being by flexible rods, are now by wires worked by twist grips. The forward end of the twist grip is provided with a cap which can be slid off, revealing the grub screw which controls the movement of the grip. If the grub screw

The gear box is easily adjusted on the Indian by a stud and nut engaging a projection on the main frame.

be removed, the whole of the mechanism can be dismantled easily. The carburetter is the well-known Schebler of an improved pattern.

The wheels themselves have undergone some alteration for 1919, being provided with more spokes and with better designed dust caps for the bearings.

On the particular model we saw, a most excellent American-made saddle was fitted, which was extremely comfortable. We were also greatly attracted by the strength of the triple head. The handle-

Latest Powerplus Indian.—

bar clip is of a pattern rather similar to that on the A.B.C., which does not allow the handle-bar stay to be raised, but permits the bar to be tilted to any convenient angle to suit the driver's taste.

The latest model embodies a larger exhaust box, wider brakes, and there are four stays to the rear mudguard. The particular model we saw is a sample, and at the present moment the company is unable to make delivery owing to the

prohibition on American imports. The same remarks apply to the Indian flat twin, which is now on view at the Hendee Mfg. Co.'s showrooms, Indian House, 366-368, Euston Road, London, N.W.1: an extremely neat little mount.

THE 1919 HARLEY-DAVIDSON.

Combined Lighting and Ignition Set. Overhead Valve Lubrication. Exhaust Cut-out.

The latest model 988 c.c. Harley-Davidson with Remy lighting and ignition unit.

ONE or two samples of the new 1919 Harley-Davidson sidecar machines have reached this country. In the main, the new model does not differ very greatly from the pattern we have already described, but it is interesting to note that it is fitted with the latest pattern Remy electric installation, which consists of a dynamo, accumulators, a coil, and a contact breaker. The dynamo serves to charge the accumulators, and to keep them in good condition for running the lamps and the ignition, while above the dynamo there is carried a coil, by means of which the current is converted from low to high-tension. The contact breaker is somewhat reminiscent of that on a magneto, and is driven by a vertical

shaft from the dynamo, and is in a position from which it is easily reached for the purpose of adjustment and cleaning. The accumulator is an Exide one, six volts, fifteen amperes. The switch controls the lighting of the head, side, and tail lamps.

In the Harley-Davidson engine the overhead inlet valve is still retained. It has always been found difficult to lubri-

Exhaust box cut in section to show position of cut out. When the cut out is closed the gases are deflected into the exhaust box and thence to tail pipe.

cate the inlet rockers of an overhead valve twin, and the latest Harley is fitted with a special wick lubricator, which will always keep the bearings moist, and will exclude grit.

Some improvement has also been made in the wheels themselves, the back wheel having wider hub flanges and heavier spokes. The method of attaching the handle-bars is interesting. They are provided with duplex tubes, held in two strong clips. The machine has an excellent front stand, and points of detail have been carefully studied. For

example, the horn is provided with a special support to keep it rigid, while the front mudguard is provided with a rubber flap, which is quite a useful idea, as it enables the machine to be wheeled off the kerb without any fear of the bottom of the front mudguard being bent. Another point of detail which is well worthy of mention is that the silencer is provided with a perfectly legal cut-out, in the form of a butterfly valve, which ensures the whole of the gases going through the expansion chamber before issuing into the air. Consequently, if the machine is not unduly noisy there is no legal objection to this particular form of release.

The spindles of the overhead inlet valve rockers are lubricated through a passage filled with felt, and supplied by oil from a container at the end of the rocker spindle.

The twin-clamp attachment of handle-bar to steering head.

Times to Light Lamps.

SUMMER TIME.

Easter.

The first "Peace" Easter since 1914 :
May the clerk of the weather be kind!

The Car T.T.

The motor car manufacturers ask that the proposed Isle of Man race shall not take place this year, as they are primarily engaged in reconstruction.

A Powerful Cycle Car.

At the recent Junior Car Club meet at Burford Bridge, a powerful racing car was seen trailing a length of Whittle belt, which, the driver maintained, "proved" that his vehicle was a cycle car.

Victory Cup Trial Entries.

There will probably be about sixty competitors in the Birmingham M.C.C. Victory cup trial on Easter Monday. In addition to the following, we understand there are at least twenty entries promised but not received at the time of going to press:

J. H. Bourne (8 Harley-Davidson sc.)
H. Boynton (8 Chater-Jap sc.)
T. Pike (2½ Lewis)
J. A. Masters (8 Harley-Davidson sc.)
R. D. Oliver (7-9 Indian sc.)
C. Pearson (4 Douglas sc.)
S. Smith (2½ Ivy)
Lt. J. Jameson, R.N. (6 A.J.S.)
E. Kickham (4 Douglas sc.)
R. H. Nicholls (4½ B.S.A.)
R. Charlesworth (5 Zenith)
D. R. O'Donovan (4 Norton)
J. Greenwood (8 Sunbeam sc.)
P. Delahaye (3½ Sunbeam)
J. Dudley (3½ Sunbeam)
G. Dance (3½ Sunbeam)
L. Baker (4½ B.S.A. sc.)
Rex Mundy (8 Matchless sc.)
H. P. Tatler (4 Norton sc.)
H. T. Smytheman (2½ Ivy)
H. R. Lane (4½ B.S.A.)
E. Kibble (4 Triumph)
E. R. Winkle (4½ James)
H. B. Denley (10 Morgan)
H. J. Stretton-Ward (4 Triumph)
—, Southwell (4 Norton)
G. H. Lovegrove (2½ Radco)
R. Troward (2½ Metro-Tyler)
L. Newey (3½ Ariel sc.)
Chas. Oerton (3½ Ariel sc.)
E. W. Croft (4 A.J.S.)
A. J. Young (2½ Sunbeam)
W. Austin Fell-Smith (8 Harley-Davidson sc.)
E. A. Bridgman (7-9 Indian sc.)
L. L. Sealey (4½ B.S.A.)
A. A. Farr (4½ B.S.A.)
W. J. Hassall (4 Norton)
J. L. Norton (4 Norton sc.)
H. Hassall (4 Norton)
T. Silver (Quadraut)
W. B. Gibb (2½ Douglas)
W. R. Steel (4½ B.S.A.)
B. Bellfield (—)
P. Stevens (4½ James)
H. Kuhn (2½ Lewis)
P. W. Moffatt (3½ Douglas)
C. Percival (4½ B.S.A.)
S. Wright (3½ Humber)
H. Petty (3½ Norton)

Prices.

The increased cost of 1919 motor cycles over pre-war products, while apparently heavy, compares most favourably with the extra cost of cars.

Hill-climb in South Wales.

The Ystalyfera and Swansea Valley M.C.C. are organising a hill-climb on Easter Monday, which will be held at Bwlch, two miles above Craigynos, on the Swansea-Brecon road. The competition will start at 2 p.m. Classes will be run for 2½ h.p., 4 h.p., over 4 h.p., and for sidecars. The event will be confined to members, but an invitation is extended to motor cyclists in the surrounding districts to join the club. Those interested should communicate with the hon. sec., Mr. T. P. Lewis, Gurnos, Ystalyfera. The entry fees are 2s. 6d. for one event, and 1s. for every subsequent entry.

The Spring Frame Chater-Lea.

The spring frame Chater-Lea created a great deal of interest when it made its debut at the M.C.C. opening run. The sprung portion of the frame consists of a triangle, one end of the base being hinged on to the rigid portion of the frame, while the other end of the base carries the rear wheel. From the top of the triangle to the fixed portion of the frame there runs a laminated spring; the bottom end of which is rigidly fixed, while the top end slides in a slot. The sidecar wheel is suspended in a very similar manner.

Special Features.

LATEST AMERICAN MACHINES.

NEW SIDECAR SINGLE.

A REMARKABLE SYSTEM OF ENGINE CONSTRUCTION.

The Import of Foreign Motor Cycles.

It is obvious that the prohibition of the importation of foreign-made motor vehicles will not be retained indefinitely. Not many weeks ago the Board of Trade representative in the House of Commons made an announcement which seemed to indicate that the existing prohibition would remain in force at any rate until the beginning of next September. Various committees have been appointed in connection with the Import Restriction Department of the Board of Trade to deal with each class of goods, and, so far as we can ascertain, these committees have been very active, and have taken a good deal of evidence from the commercial interests concerned. It is anticipated that some sort of rationing scheme will be adopted shortly, as was stated in *The Motor Cycle* last week.

It is just possible that a distinction will be drawn between the imports of motor cycles and imports of motor cars, since the number of motor cycles brought in from abroad is considerably less than that of four-wheelers. Since this is so, the Government may come to the conclusion that the percentage of motor cycles may be fixed at a higher figure than that for cars.

The experimental spring frame Chater-Lea mentioned above.

N.M.C.F.U. MEMBERS EXPERIENCE A BLIZZARD IN DERBYSHIRE.

Whenever there is the slightest prospect of snow, one can usually be sure of a blizzard on the Derbyshire hills. On a recent run of the Sheffield N.M.C.F.U., the members were caught in a gale while crossing Baslow Moor, the photograph being taken at the highest point immediately the snow had ceased.

Mechanical Oil Pump on M.A.G.

Mr. O. de Lissa, of the M.A.G. Co., turned up for the M.C.C. opening run on his old M.A.G. sidecar, with an engine fitted with a mechanical oil pump.

Petrol Licences.

The number of licences issued to motor cyclists by the Petrol Control Department is as follows: First issue, 95,098; second, 48,580; third, 34,462; fourth, 29,152; fifth, 45,189; sixth, 56,309. Included in the sixth issue there is also a total of 37,003 licences issued to owners of private cars and motor cycles which are now grouped together.

Olympia Car Show.

The late Mr. Byam Shaw was consulted by the Society of Motor Manufacturers and Traders, Ltd., on the subject of the stand and building decoration for the November Olympia Motor Show. Circumstances have prevented the carrying out of his ideas of a suitable setting for the display of motors from all the allied countries, but it is to be hoped that something of the kind may be possible in 1920.

The scheme which is in preparation for the forthcoming international exhibition will, however, be a big departure from the past.

Imports and Exports.

The value of motor cycle imports admitted into this country under licence during March amounted to £12,634. We stated last week that there is a possibility of their being greatly increased, and in the near future firms may be allowed to import 50% of their pre-war quantity.

EXPORTS.

It is cheering to note that export values for March show an appreciable increase. There is an advance of £39,936 over February's figures, while the table below shows respective figures for March, 1917, 1918, and 1919.

	1917.	1918.	1919.
Motor cycles	£78,850	£32,593	£154,202

Petrol Economy and the Colour of Tanks.

A paragraph published recently in *Chambers's Journal* under the heading of "Science Notes" points out that the British Red Cross have been experimenting with petrol tanks in hot countries, and have discovered [We think it is not a recent discovery.—ED.] that tanks painted white cause the least loss of petrol vapour by evaporation. The experiments were made by placing a powerful arc light three feet away from tin plates painted various colours, and in one case the tin plate was unpainted. The rise in temperature was noted in each case, and it was found that the best results were obtained from the all tin plate, the worst being from the one coloured black. White was finally adopted, because the tanks had to be painted for other reasons.

The above is not written with the idea of suggesting white as a colour for motor cycle tanks, because loss by evaporation is so small as to be negligible.

A Warning.

Motor cycle thieves are very busy in Glasgow just now, and some particularly daring cases have been brought to our notice. One reader's garage was broken into and his 1919 Triumph detached from the sidecar and stolen.

To Purchasers of Speedometers.

We hear that there are a number of Stewart speedometers in this country made to register in kilometres per hour, with the dials altered to read in miles per hour. Needless to say they are not being distributed by the recognised importers of these instruments, Messrs. The Cooper Stewart Engineering Company, Limited, who are at a loss to know whence they are coming. The word "kilometres" is neatly erased, and "miles" substituted, the alteration not being noticeable until the dial is carefully examined.

Readers should not purchase speedometers without a close examination.

The meet of the Birmingham M.C.C. at Hockley Heath last week on the occasion of the opening run to Stratford-on-Avon.

THE UNIQUE ELECTRIC REAR LAMP.

ONE of the neatest electric rear lamps for motor cycles we have seen is known as the Unique, and is the product of Messrs. M. Mole and Son, of 51-54, Charlotte Street, Birmingham. It is exceedingly small, its diameter approximating to that of a shilling; it is exceptionally strong, and the ruby glass is well protected. A slot is cut in the side of the lamp to give a white light on the number-plate. To fit the lamp is

An electric rear light lamp of very compact design.

quite a simple matter. A hole about half an inch in diameter is drilled, and the lamp then fits snugly against the number-plate, and is secured in position by a nut and lock-nut. Well finished and nickel-plated, the lamp sells for 5s. complete with 4-volt bulb.

ELECTRIC LIGHTING SETS FOR SIDECARS.

ALTHOUGH electric lighting was a novelty on motor cycles a very few years ago, there are quite a large number of machines now fitted up with electric lamps. Some of these machines are fully equipped with dynamo lighting sets, and the other extreme—the dry battery—is to be found on machines which at night are used only for short distances. Between these two systems there is the accumulator set which will always be popular where recharging facilities are available.

The lamp set illustrated on this page is one of two marketed by Messrs. H. Taylor and Co., 21, Store Street, London, W.C.1, and consists of a six-volt 40 amp.-hour accumulator, a head lamp, sidecar lamp, and rear light.

Both the head and the side lamps are finished in black, the former having an adjustable fitting which allows it to be set at any angle, and has an adjustable bulb holder for focussing. The tail lamp is of cast aluminium. A switchboard is provided and fitted with a trembler switch. The lamps are of the two-pole variety, and the side and tail lamps are in series

A battery electric lighting set suitable for a sidecar outfit.

so that in the event of the latter giving out, the rider receives intimation at once because the side lamp also goes out.

Messrs. Taylor also market a less expensive set consisting of three cast aluminium lamps, which is more suitable for town work than touring.

AN EXTRA AIR VALVE.

IN these days of heavy and expensive petrol and benzole an extra air inlet is often a useful fitting, resulting in great economy and a cooler engine. Messrs. Bowden Wire, Ltd., Victoria

The Bowden air inlet with the position of the gauze-covered inlet changed over.

Works, Willesden Junction, London, N.W.10, have lately placed on the market a special extra air inlet for motor bicycles.

The Bowden air inlet in section.

This consists of a properly ground-in valve which, when closed, entirely shuts off the air, and ensures an easy start. The main body of the air inlet has two outlets tapped with the same thread, so that the gauze cap will fit on either.

This arrangement is a great convenience to anyone fitting the device to his motor cycle, as it enables the air inlet to be placed in whatever position is most convenient, according to whether or not there is sufficient room to place it vertically. If not, it can be placed horizontally. Carefully screwed into the inlet pipe, and provided with a lead washer, it should be quite secure and free from air leaks.

STRAP SUBSTITUTES.

WITH reference to the article contributed by F.A.S. on page 170 of our issue for February 20th, Messrs. Henry Milward and Sons, Ltd., needle and fish hook manufacturers,

Milwards' strap substitute.

Washford Mills, Redditch, inform us that they have a quantity of turnbuckles in stock which may be used for drawing tight steel wire used in the place of straps, as suggested in the article previously mentioned. For attaching such rigid articles as a wooden box or petrol can to a luggage carrier these wires and turnbuckles should be extremely useful.

READERS' ROAD REPORTS.

OUR request for reports of road condition has resulted in much detailed information coming to hand. The following are a few of the reports very much condensed:

Great North Road to Darlington, Durham, Newcastle, and Edinburgh.—Good condition, with exception of two or three miles after passing Wentbridge (eleven miles from Doncaster) and short lengths near Micklefield, about twenty miles from Doncaster. After passing Braham the road is good. The North Road to York (via Tadcaster): Fairly good to Tadcaster, very bad from Tadcaster to York. North Road to York (via Selby): Fairly good.

The road to Gainsborough, Louth, etc., excellent from Bawtry onward. The road into Lincolnshire to Scunthorpe, Brigg, and Grimsby (via Hatfield and the Keadby New Bridge), fairly good straight forward from Belton via Beltoft to Althorpe; the "Tween Rivers Road" very bad, the whole width of the road having been stoned without being rolled in.

Northwich to Tarporley.—One mile poor out of Northwich. Remainder very good.

Liverpool to Preston, via Ormskirk.—Good generally. One bad stretch one mile north of Aintree to three miles north of Aintree.

Ormskirk to Southport.—Excellent.

Ormskirk to Tarleton.—Excellent.

Birmingham to Wolverhampton.—In a very bad state.

Birmingham to Stratford.—Fairly good.

Wolverhampton to Stafford.—Poor generally.

Stafford to Nantwich.—Good generally.

Scotland. Inverness to Wick.—From Inverness to Beaulie, very bad—ruts and pot-holes. Stretches fair to Conon, very fair to Tain and Ardgay. Bonar Bridge, bad. Best road via Dornoch to Golspie, Brora, Helmsdale, fair. Best to go round via Tain rather than branch Novar to Kincardine. Very bad near Altnamain, owing to timber traffic.

Owing to the serious condition of the road from Bristol to Ilfracombe, via Bridgwater and Williton, motor cyclists, when arriving at Nether Stowey, are advised to take the second turning on the right on leaving the village, passing through the village of Stringston, and thence to Watchet and Minehead.

DUNLOP RUBBER STUDDED COVER.

REAL SAFETY.

TYRES with an effective non-skid device are a definite insurance against trouble.

These Dunlop rubber studded non-slipping motor cycle tyres afford very complete insurance. They're entirely effective because the studs are staggered, the big centrally placed studs take up the main drive and the smaller studs at the side prevent side-slip when the motor-cycle's canted.

It's a great tread and a great tyre.

The Sidecar Single.

THE REX MOTOR MANUFACTURING
CO., LTD., ————— COVENTRY.

A REGION of ROMANCE

The Huers' Hut at Newquay—a fisherman's tower, whence a look-out used to be kept for schools of pilchards.
The motor cycles are a Triumph two-stroke and a New Imperial.

IN the minds of most people "Cornwall" suggests a remote part, separated, as it were, from the rest of England, and associated with legends, superstitions, and traditions galore. The "Delectable Duchy" is looked upon as a far-away land where, not so very long ago, its inhabitants lived in a partly civilised manner. It seems a kind of mystery county, with holy wells, cromlechs, stone circles, crosses, and tales of giants, fairies, and spectres. Probably the reason why Cornwall seems so isolated is because centuries ago all the British inhabitants in the West of England were ordered to reside on the further side of the Tamar. The people thus shut off retained their own language and customs longer than they would otherwise have done had they mixed with others. Even now, in some parts of Cornwall, a visitor or "up-country" man is spoken of as a "foreigner"—although he might have come no farther than from Somerset.

Halfway between Plymouth and Penzance, forty miles from each, is St. Austell, the centre of the china clay industry; and in this neighbourhood the writer and his friend, mounted on a Junior Triumph and a New Imperial Jap, have often

visited some interesting spots, a few of which are described and illustrated here.

The superior kind of clay out of which some of the most beautiful porcelain is made is obtained in this locality, and thousands of tons of Cornwall's "white wealth" is used every year for paper-making and other purposes. China clay is simply decomposed granite, and the streams which run through the pits are so whitened that the district has the appearance of a land flowing with milk—if not with honey. Huge pyramids of sand are dotted here and there, left behind and piled up after the clay has been washed out, giving a distinctive appearance to the landscape. Just as some lucky people are said to be born with silver spoons in their mouths, so Cornishmen—or a large number of them—may be

said to come into this world with pick and shovel in their hands. Thousands of Cornwall's natives take to digging and delving like ducks take to water. In this locality they dig for china clay, and the enormous open pits, dazzling white in the sunshine, bear witness to their industry.

A spin of eighteen miles through old-world villages and country lanes, by

A Cornish china clay mine near Hensbarrow.

A Region of Romance.—

way of St. Stephen's, will bring Newquay into view. It has been transformed in recent years from a little fishing hamlet into a modern watering place, occasionally favoured by Royalty. On the headland stands an interesting structure known as the "Huers' Hut." This is the point of vantage where a lookout was kept for the "schools" of pilchards which periodically visit the shores of Cornwall. Fishermen, always on the watch, would give the signal—"Heva! Heva!!"—to others waiting in the boats below.

King Arthur's Hunting Ground.

From Newquay to Lostwithiel is a fine run, part of the way being along the Goss Moors, where is one of the fastest and straightest stretches of road in England. According to tradition, this moor was once a splendid hunting ground, and afforded good sport to King Arthur and his knights in their time. Excellent snipe shooting is still to be obtained there.

The four-stroke proved slightly faster than the Junior Triumph here, and gradually drew away from it when both were "all out." But there is really very little difference in the two machines—or at least these two—at speed or hill-climbing. The two stroke is rather more comfortable to ride, and at a speed of thirty-five miles an hour, which is about its maximum, is as steady as one could wish. The writer

has ridden it two thousand miles, and has had no trouble whatever, except that caused by one of the first new British magnetos. This magneto was readily exchanged by the makers for another, which has given every satisfaction. The top gear performances on the little Triumph are extraordinary, whilst the stiffest hills even in Cornwall may be tackled on low gear. There seems to be no fault to find with the "petrol" system of lubrication, and it is simplicity itself. Simply add one and a third pints of suitable oil to a tin of petrol, shake up well, and fill up the tank. So long as there is any fuel to run on, the rider can rest assured that the lubrication is looking after itself—the more gas given and the faster the machine goes, the more oil the engine and bearings get. Riders of some two-strokes, it would appear, experience trouble occasionally in starting. The Triumph is one of the easiest starters imaginable—it two-strokes perfectly right away, and continues to do so. Full air can be given, and speed controlled without any further alteration of the air lever. The New Imperial has also proved very reliable, and nothing better could be desired in the four-stroke lightweight class.

The Oldest Railway Station.

At Ruthern Bridge, which can be easily reached by turning off the Goss Moor, in the form of an old-fashioned thatched cottage, stands the oldest railway station in England. It is near the terminus of a branch of the London and South-Western Railway. In days past the line was used for conveying minerals and goods to Bodmin and Wadebridge. Passengers obtained their tickets at the cottage, and rode in open trucks. Two engines, known as the "Elephant" and the "Camel" used to deal with all the traffic.

Near Roche, which is about six miles from St. Austell, there is a remarkable group of rocks, consisting of huge masses of granite towering one above the other to a height of a hundred feet. The ruins of a chapel stand in the centre, formed by the adaptation of masonry to the natural rock. A hermit, it is said, used to reside in this lofty edifice. Some distance away lies the Holy Well. There was once a chapel near the well, and the figure of a saint, but both have now disappeared. It was the custom of the peasantry to offer

(Top) Roche Rock, a lofty abode of a hermit in former days. (Left) A Cornish wayside cross. (Right) A fast road across Goss Moor.

A Region of Romance.—

the saint pins, which were bent and thrown into the water. Another holy well is situated nearer St. Austell, within the remains of an old baptistry, wherein also bent pins may still be seen. The custom was to throw these bent pins into the well and "wish" at the same time. People were "ill-wished" in this manner, the pins representing, according to some authorities, miniature daggers—signs of injury to those against whom the "ill-wishers" had a grudge. Still another well is to be found at Holywell Bay. Here it was the custom for a pin to be placed carefully on the water; if it floated the wisher expected to obtain his wish.

Near Roche, the road leads past Hensbarrow, a mound on a lofty part of Cornwall, commanding a view of both seas. This is supposed to be the burying-place of a prince or prince's of remote antiquity. Close by is another mound known as Cocksbarrow. The long barrows are held to have been erected by a long-headed pre-Aryan race, the round barrows by a later round-headed Celtic people. In the latter cremated bodies have been found, and in one burying-place over fifty urns were found around the principal and central one.

Church used as a Stable.

Nine miles the other side of St. Austell lies Lostwithiel, in a hollow by the Fowey river. Its interesting church possesses one of the most beautiful of the old spires in Cornwall. The old font, with its grotesque carvings, was subjected to great indignity in 1644, when the church was used as a stable and barracks by the Parliament forces. One of the troopers

baptised his horse from it, by the name of Charles, to show his contempt for the church and king.

Prettily situated about a mile from the town are the magnificent ruins of Restormel Castle, probably built at the time of the Conquest. The outer wall is surrounded by a circular keep, with a tower and gatehouse, and a moat, now dry, sixty feet wide and thirty feet deep. The ivy and creepers with which the castle is now covered give it a very picturesque appearance. It is two storeys high; the upper one, wherein the state rooms were situated, had some fine Gothic windows. An oven of remarkable size was a feature of the kitchen quarters.

Sinners and Saints.

Steeply up Lostwithiel the road passes, near Castle-down, an old Cornish "cross." The wayside "crosses" scattered throughout the county are familiar features—tokens of the teachings of missionary saints who introduced Christianity into the land. Many parishes, towns, and villages are named after these saints. Asked why there were so many saints in Cornwall, as compared with other counties, one worthy is credited with the reply that it was to counteract the large number of sinners there! At all events, one of these saints did the neighbourhood a good turn, for he taught the British the art of wool-combing, and St. Blazey, further on the road towards St. Austell, is named after him.

These are but a few of the many interesting places to be found in this part of Cornwall, and now one can travel about again—"in peace," more or less, there will be the usual large number of visitors to see them again shortly.

SIDECARRING IN THE U.S.A.

Indian outfts on an American highway, Massachusetts. Its surface appears to compare favourably with British roads. The scenery, too, in this State is fine.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

IN STOCK!

Sir,—I beg the hospitality of your columns to protest against the practice extremely prevalent among trade advertisers just now of quoting various popular makes of motor cycles as "in stock," or "for immediately delivery," when such is not the case actually at the time of advertising. This is not only extremely disappointing to would-be purchasers, but results in considerable waste of their time and money, to say nothing of their tempers. I can see no point at all in this deliberate misrepresentation, for all motor cyclists are perfectly well aware of the difficulty of obtaining machines just now. This practice, if continued, is likely to lead to discrediting of advertisers by the public, and must ultimately reflect on the reputation of the firms concerned.

B. HUMPHREY.

TABLOID HISTORY OF AIR-COOLING.

Sir,—I read with interest the letter by "Revs." under this heading, in your issue of April 3rd. I regret that I did not see the letter by "Road Rider" on this subject, but, apparently, he said that rotary engines are the most wasteful of all types with petrol and oil. "Revs." agrees with him.

Excessive oil consumption I do not dispute, but I do not agree with the statement as to petrol consumption. It is generally believed that rotaries are extravagant in petrol, but this is entirely erroneous. "Revs." mentions the Le Rhône and Bentley engines in his letter; at 15,000 feet, fully out, the former consumes $8\frac{1}{2}$ galls. per hour, the latter 11. There are several stationary engines, which, at the same height, consume anything from 14 to 18 galls. per hour, so the rotary scores.

In the penultimate paragraph of "Revs.'s" letter, he says, "It yet remains to be proved that the more improved types, the Le Rhône, Clerget, Canton-Unné, Bentley, etc., can really favourably compare with the latest radials for fast scout work." Surely he should have said it yet remains to be proved if the latest radials compare favourably with the rotaries. It is fairly obvious to what radials he is referring, but they have not yet been proved.

PITOT.

PROTECTION OF THE MOTORING PUBLIC.

Sir,—May I be allowed to warn your readers of the necessity of extracting from all motor firms the same safeguards as these are in the habit of obtaining from their customers?

Doubtless there are few firms which definitely resort to sharp practices, but, unfortunately, there are some whose negligence where other people's property is concerned verges on the criminal. One should not be put off by such phrases as "That will be all right; we'll see about that for you."

About twelve months prior to the Armistice I was recalled to France at the usual short notice, having only a half-day to settle up my affairs in the depot. I made a clear verbal arrangement with a responsible member of a motor firm to collect a detached sidecar the next day from my billet, and to keep or sell it for me. Not long after arriving in France, I wrote to the firm, to be satisfied that the sidecar was in their possession. No reply was sent to my letter, and, thinking that any reputable firm would at once tell me, had they not taken possession of my property, I let the matter drop.

On coming home recently, I wrote again, and learned that the firm professed ignorance of the whole matter. They excused themselves by saying that the member of the firm with whom I made the arrangement had now left, but they

conveniently made no reference to my unanswered letter to themselves.

I trust there are not many officers or men whose absence on service has made them victims to such methods of business. This little lesson has cost me £10, so that is why I take the liberty of trying to share it with your readers.

THE LEARNER.

MAKERS AND PROMPT SERVICE.

Sir,—I quite agree with Mr. C. F. Edmunds regarding the prompt and business-like methods of the Scott Engineering Co. Recently, on my way from England to Scotland, the rear chain of my Scott gave out, and I wired the makers from an unknown address in the Lowlands to send me a renewal. I possessed no permanent address at the time, had not written the Scott Engineering Co. for two years or more, yet they remembered my name as that of an old customer, and despatched the chain on the same day as they got my wire.

Later I wanted a sidecar cone, and received it in a post or so, with apologies for the high price they were compelled to charge, which was due, they explained, to the cone being an obsolete type, with the result that a machine had to be specially fitted up to make it, with resulting expense and delay.

When the Scott people have overhauled and tuned my machines they have always made a splendid job of them, and such prompt service is a real pleasure—especially in these days, when everyone seems so ready to take advantage of the extraordinary state of things in order to obtain maximum profits at a minimum expenditure.

B. Mossdale.

ADVANTAGES OF A TWO-STROKE.

Sir,—Being a very enthusiastic two-strokeite, I am afraid I cannot let F. W. Varney's letter pass without comment. Has "Ixion" noticed it, and does he remember his remarks of my "Some Bicycle"?

I have ridden many two-strokes, including Levis, but have never obtained such results as F.W.V. claims.

My present machine, an Excelsior-Villiers, which is the best I have owned, will do 45 m.p.h. for a few minutes on a good road, but certainly not *average* 45 m.p.h.; 25 m.p.h. would be nearer the mark. F.W.V. also claims 35 m.p.h. average with a sidecar. Surely there is a mistake somewhere.

It is really marvellous how these little engines will pull, and, in my opinion, they are ideal for the rider who is out to see the beauty of our country, but, of course, are no use to the speed merchant who scours the country at 60 m.p.h. and sees nothing but the road.

The chief trouble of most riders I have met seems to be overheating if the engine be run fast for any length of time. However, in many cases, particularly where lubrication is by drip feed to induction pipe, the cause of drying up which follows is oil shortage.

With this method of lubrication, the drip feed is considerably affected by crank case suction, which is very high at small throttle opening, but when opened out the vacuum in the crank case is partially destroyed, and the drip slows up just at a time when more oil is wanted. However, I find if I keep the exhaust a bit on the smoky side, and open the oil for a speed burst or hill-climb, there is no trouble.

It was a great surprise to me to see such a small percentage of votes for the two-stroke in your "Which Type?" voting results. I should like to hear readers' remarks *against* this type, and why they did not vote for it.

EXCELSIOR.

King's Heath.

WHAT SHALL WE WEAR?

Sir,—I have been much interested in several letters in your paper from lady motor cyclists on the subject of dress. I drive a Royal Enfield combination, and though at first I had a coat or two chewed up in the chain, I cannot understand anyone who has once tried it giving up riding, as one of your correspondents says she has done, on account of the difficulties of finding a suitable costume.

I have solved the problem quite to my own satisfaction, and my friends tell me my outfit looks very smart. I wear a land worker's kit made of brown corduroy velveteen, with a neat little hat to match, to which my vanity has added a touch of orange woollen embroidery. The coat reaches nearly to the knees, and is loosely belted; it has a large pocket each side, and a small breast pocket; the collar can be turned up in cold or wet weather; breeches are ordinary equestrian ones, and I wear riding boots, or in wet weather a pair of rubber Wellingtons, and carry with me a set of youths' waterproof overalls. For very cold days I have a light sleeveless fur jacket which, worn over a knitted jumper, and under my corduroy coat, defies even a north-east wind. I have a skirt to match my costume, which buttons all down the front, and if I wish to be very respectable I put this on over my breeches when I dismount. I find nothing keeps my hands so warm as angora rabbit-fur gloves, but these are very expensive and do not wear well for cycling. I find string hunting gloves warm and strong, and they have the advantage of never getting slimy as leather gloves do when very wet.

I find that in these enlightened days my costume does not make me very conspicuous, and at the same time does not make me look a frump. (Mrs.) BEATRICE BRADLY.

SILENCERS.

Sir,—The "noisy" motor cycle controversy prompts me to forward details of what I consider to be an improvement to the silencer of an 8-10 h.p. twin 1912 J.A.P. engine.

The ordinary silencer shell, end plates, and bolts were used, but the baffle plate was taken out and a short length of 1 in. steam tubing (gas tubing would do) with a reducer screwed on the end.

The whole is held together by the usual three bolts which go right through, and, incidentally, hold the cup or "reducer" tightly in place. The silencer is suspended by two ordinary cycle chain adjusters, through the holes of which the front bolt, which holds the engine into the frame, passes.

The effect of this design is that the gases enter and leave on the same side, the gases passing into the shell, impinging on the cup, striking the end plate, and passing out through the pipe and fish-tail end without obstruction.

The result is astonishing to those who know the noise that an 8 h.p. twin can make when opened out, as it is now difficult to distinguish explosions from the noise of the valves and the whirr of the chains. The engine will help a sidecar along at about 45 m.p.h. without distress, and does not overheat.

The alterations can be carried out by any plumber, or, if done at home, from materials obtained at any good ironmongers, will cost about 3s. to 4s. CB 486.

THE NEW A.B.C.

Sir,—May I thank Mr. Bradshaw for his courteous reply to my criticisms. I note that he agrees with me on point number one, and is inclined to do so on number four and number two. I am glad the mudguards are not narrow; they appeared so in the illustration. Number five in my suggestions was simply on the score of appearance; if there is any real objection to the grease cap on the spindle end, I will give way. It is, however, sometimes used.

With regard to number three, the height of the splashguards. My own experience shows that these should be at least as high as the top of the tank. In support of my contention I would mention the fact that a contemporary stated that the A.B.C. was so well mudguarded that the

mud which, after a long run on bad roads, was deposited on his knees brushed off easily when dry. Truly a wonderful testimonial to mudguarding efficiency.

JOHN HOLLAND.

Sir,—You have passed an "old chestnut" fallacy in "The Impressions of the New A.B.C." by B. H. Davies. I refer to his remark on page 276, *re* ball or roller bearings requiring no lubrication. This is certainly untrue, as any engineer will agree. There must be a certain amount of sliding or friction between the balls and the race, if the difference of diameter of inner and outer race is finite. In other words, if the balls have a finite dimension, there must be friction.

I think this misleading statement should be corrected—hence my rush into print.

May I add one remark on the design of this delightful mount. The spring frame (rear) is out of date very badly. Could not the carrier be so arranged that one's luggage would not suffer from vibration? I speak feelingly. The last trip I made, my tooth paste got well mixed up with a cake of chocolate, a tooth brush, and some brilliantine.

C. W. PIDCOCK.

Sir,—I read with great interest the descriptions of the new A.B.C. motor cycle and some of the criticisms of it. In design it is without doubt several years ahead of any other post-war machines of which I have read the specifications. With one or two exceptions it is practically a perfect solo mount. The improvements which I suggest could easily be incorporated, and would add considerably to its refinement and exclusiveness. These are:

(1.) The brakes should be a fixture on the frame rather than on the wheels, to allow of—

(2.) Interchangeable wheels being fitted. Manufacturers seem to think that the owners of *de luxe* sidecar outfits are the only class who desire this convenience.

(3.) An oil bath chain case, easily detachable if necessary, should be fitted, at any rate for machines for use in this country. This is an infinitely preferable method of oiling the chain. Spraying oil on to it is bad, as with the road dust the oil makes quite a good grinding compound.

Edinburgh.

CONNOISSEUR.

BALANCING A SINGLE-CYLINDER.

Sir,—I think you are not quite accurate in saying, in your editorial in the issue of April 3rd, that it has hitherto been impossible to balance a single-cylinder engine, though, of course, it is true that no system has been successful enough to come into practical use on any scale.

It is, however, possible to balance a single-cylinder engine by prolonging the connecting rod beyond the big end and

putting there a bobweight heavy enough to make the centre of gravity of the connecting rod assembly coincide with the crank pin. As the mass of the connecting rod, piston, bobweight, etc., coincides with the crank pin, it can be balanced by a rotating balance weight, balancing the whole mass.

At half-stroke, of course, the rotating and reciprocating parts are all moving at the same speed as the balance weight, and are therefore balanced. At the top and bottom centres the piston is stationary, but the bobweight is moving twice the speed of the balance weight, and therefore the engine is still balanced. I think in this manner that the effect of the connecting rod angle is balanced, and the engine therefore more perfectly balanced

Method of balancing an engine.

than a four-cylinder vertical. An engine balanced on this principle was shown at one of the motor shows a good many years ago. I fancy that the reason it did not come into use was that it increased the wear on the big end.

F. STRICKLAND.

[The method to which our correspondent refers is illustrated in Professor Sharp's book, "Balancing of Engines," and gives excellent primary balance, but a very pronounced transverse couple. Also Mr. Strickland has quoted us incorrectly. We said that the single-cylinder could not *by any convenient means* be balanced perfectly.—Ed.]

AN UNUSUAL INCIDENT.

Sir,—In your issue of March 27th I notice reference to a disturbance in Dublin, when some officers were threatened, and their motor cycle and sidecar thrown into the Liffey. Surely, I think, you describe this incorrectly when you call it an "Unusual Incident in Dublin"! HAD SOME.

Bridlington.

WHERE IS A GARAGE WANTED?

Sir,—For the last few months (since my demobilisation) I have been searching around for a suitable locality in which to recommence business. I intend opening a garage to cater especially for motor cyclists on repairs and accessories, etc. Up to the present every locality I have considered good has been crowded with firms in the same line, who have obviously come into being during the war.

I am sure there must be places which are not so well catered for, and where the motor cyclists of the locality would like someone to look after their needs.

It struck me that if you would be kind enough to publish this in your valuable paper, perhaps some of your readers would communicate with me through you.

I should like to state that I am an engineer and have previously been in the trade. I volunteered in 1914, being one of the original D.R.'s. My connection has been lost during the war, and has naturally drifted to another, who, not having joined up, reaps the benefit. MONS.

Shepherd's Bush.

MOTOR-ASSISTED BICYCLES.

Sir,—For many years we have been ardent admirers of your publication, particularly enjoying your unbiased editorials and the constructive criticisms of your contributing writers. We therefore feel that you will welcome our calling your attention to what we feel has been an unjust "obituary," appearing in your February 20th issue.

It is true that Cyclemotor production was reduced almost to a negligible quantity during the period of the war. Being originally a Canadian concern possibly accounted for our taking an early interest and interpretation of the world war situation, which resulted in our early enlistment as a 100% manufacturer of war essentials, and during the time of the war we were important factors in helping to manufacture Hispano-Suiza aeroplane motors, as well as to design and produce certain features of the Handley Page.

We realise that possibly to those not fully informed, the Cyclemotor has been temporarily lost sight of, due to the more important world issues at stake; but we feel that it is hardly just to read a concern out of the industry because it has been patriotically devoting its entire energies to the nation's service.

It is therefore natural that we wish to place our position properly before your readers. By the time this letter appears Cyclemotor and Evans Power Cycle production will have resumed its normal pre-war output, and by June our increased manufacturing facilities will permit a 50% increase over former capacity. We have at the present time on our books active orders that have accumulated during the war period which, with recent new business at hand, will tax our manufacturing ability up to January, 1920.

We can assure you that we absolutely propose to meet with our best and undivided efforts the fast-growing demand for our product both at home and abroad.

CYCLEMOTOR CORPORATION,
A. C. PRICE, Sales Manager.

Rochester, N.Y., U.S.A.

LOSING ONE'S PROP.

Sir,—"Torque" in his turn ignores another common cause of a lost-prop—failure to maintain sufficient pressure when running on "bottom tank," and with the Rowbotham pump sluggish or out of action.

But we are not concerned so much with the causes of lost props as with the fact that every lost prop spells a forced landing with a stationary engine. "Airmick" has "never seen a propeller stop rotating whilst the machine is in the air, unless the engine seizes, and then the propeller-shaft generally breaks." It is hardly relevant to the discussion to mention the fact, especially as he professes to agree with "Torque," who holds that props may be lost through several causes, and again because "considerable experience" would, one has supposed, have dispelled his rather vague views on propeller slip as expounded in his letter.

The "question before the House" is—When one has lost one's prop with a stationary engine, can one regain it solely by setting the controls, etc., in the starting position, and putting the machine into a dive?

"Torque's" generous offer of the handsome wreath makes me think that he is not now so confident that losing one's prop with a stationary engine is a matter of small account. I would remind him that he asked me for *any* service type, so that he can barely grumble at my choice.

"Airmick" also asks for an example, and as he is a seaplane man, I give him the 320 h.p. Sunbeam and the 240 h.p. Renault-Merc. If his "considerable experience" extends to large flying boats, he will no doubt have met the 345 h.p. Rolls-Royce. Perhaps he may even be able to prove "Torque's" point and qualify for the wreath!

REVS.

WANTED, WEATHER PROTECTION.

Sir,—I was much interested in reading the letter under the above heading signed A. W. Mansfield, as it exactly fits my own case. I became tired of repeated mud baths and sold my sidecar outfit. Then I bought a two-seater car of a good make, but, whilst I am now immune from mud splashes, I have the disadvantages enumerated by Mr. Mansfield, namely, lack of vim in ascending a hill and the necessity of changing down on hills that my motor bicycle would take on top. I wrote to the manufacturers of my last machine expressing my satisfaction with the power and reliability of the engine, and asking if they could not devote a little attention to *real* mudguards; but in their reply their sole interest seems to be centred in mass production on a larger scale than before, and they are not at all interested in the demands of the public.

I know of many motorists who speak with disgust of a motor bicycle, because of the lack of protection from mud, and of others who would become motorists but for that drawback. You give an illustration of a new sidecar outfit (6 h.p.) which has a metal shield to protect the silencer and magneto from mud. Why could that shield not be extended on each side to protect the driver also? I am getting sick of the term "ample mudguards" with every new machine put on the market, when we all know perfectly well that they are very far from ample. College mudshields are very good as a substitute, but, being of leather, they become torn. People who talk about wind resistance make me tired. Mudshields cause no more wind resistance than the rider's legs. Why cannot the footboards be continuous and form a mudshield connected to the front forks, or at least to the front down tube?

It would also be a great convenience if we could have enclosed tappets, so that conversation with one's passenger would be possible. The manufacturer who is enterprising enough to provide a motor bicycle with real mudguards, spring frame, and noise eliminated to such an extent that conversation with the sidecar passenger is possible without shouting at the top of one's voice, provided, of course, that the engine is thoroughly reliable, will certainly have a very large sale as soon as his machine becomes known, and this is a matter of judicious advertisement.

Dingwall.

ANNO DOMINI.

SUMMARY OF CORRESPONDENCE.

Mr. J. E. S. Lockwood writes to say that on March 22nd he received a specification of an invention relating to aeroplanes, but the envelope was torn and the letter apparently lost. He has no knowledge of the sender, but believes him to be a reader of *The Motor Cycle*.

BOOKS FOR MOTOR CYCLISTS

MOTOR CYCLES AND HOW TO MANAGE THEM

The recognised standard text book of the motor cycle; deals with all types of machines and with every part of the machine. 400 illustrations. Price 2/6 net. By post, 2/10.

HINTS AND TIPS FOR MOTOR CYCLISTS.

A valuable collection of useful "wrinkles" and items of information concerning the running, management, and repair of motor cycles. Price 2/- net. By post, 2/3.

Obtainable by post (remittance with order) from
ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4.
or of leading Booksellers and Railway Bookstalls.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Three-wheeler.

? To obtain protection in bad weather, I am thinking of making a runabout of an old 6 h.p. A.J.S. Could you tell me what objection there is to one wheel at the front, centre steering, and two at the back? I should like to know if it would be bad for cornering, steering, or speed.—W.J.W.

The idea has been carried out by several people. The only objection is that the vehicle is naturally rather light in front. The front wheel is apt to bounce, and it is rather difficult to keep it rigid. It would probably also be rather awkward to steer at speed.

Exhaust Pipe gets Red Hot.

? I have a 4½ h.p. Singer motor cycle. The cylinder has been recently rehored. The timing seems to be correct, but what is troubling me is the flame coming through the exhaust pipe and silencer, making them red hot after a few minutes' running. It starts up quite easily and runs very well on half petrol and half benzole. If you can tell me the best way to get over this difficulty I shall be greatly obliged.—H.L.

Evidently you are running on an incorrect mixture; possibly it is rather too weak. A weak exhaust valve spring causing the exhaust valve to close late might also cause this trouble. A third likely cause is that you are running with the ignition too far retarded.

Adjusting a Gear.

? (1.) In adjusting the clutch spring of the N.S.U. gear, how is it possible to tell exactly how tightly to adjust the spring, which is a new one? (2.) Ought the nut for adjusting the tension of the spring to be screwed right home, or just as far as is necessary? If the latter, what prevents the nut from unscrewing? (3.) As I am assembling the complete gear parts myself, how would you advise dealing with the clutch? (4.) When the clutch is in, the high gear is in position, and when right out the low gear is working. Will you please explain how this can be, as when the clutch is out, what connection has the axle to the pulley? So far as I can see, the engine must run free.—H.W.S.A.

(1.) You will have to test the adjustment of the clutch spring by experimenting until you get it right. (2 and 3.) The nut should be screwed right home. The pressure of the spring prevents it from unscrewing. (4.) The high gear is in

position when the middle clutch cone is in contact with the female clutch cone on the planet wheel carrier, and the free engine is available when the male clutch cone is withdrawn by means of the clutch fork. The low gear is obtained by holding the sun wheel through the inner and outer clutch discs.

The Nodon Valve.

? I should be very glad if you would give me a few particulars as regards the Nodon valve for alternating currents. (1.) What quantity and strength of phosphate of soda solution? (2.) Size of aluminium and lead plates? (3.) The more suitable voltage to use: 200 or 50 (I have both available)? (4.) Is the apparatus suitable for charging accumulators, say, up to 8 volts 60 ampere hours?—W.E.F.

(1.) The phosphate solution should always be a saturated one—that is, the water should be allowed to take up as much phosphate as it will. The quantity depends on the size of the jar used, and is not important. The solution, however, should not be allowed to come up higher than within 2 in. from the top of the jar. Distilled water should be used if possible, otherwise clean rainwater. (2.) The size of the plates is not material, but a size commonly used is 10 in. × 1 in. × ¼ in. for the aluminium, and 10 in. × 2 in. × ¼ in. for the lead. About 6 in. of the length will be immersed in the solution, and a current of about four amperes will pass easily. (3.) By all means use the fifty volt supply. It is about the most convenient you could have for the purpose. You will find that the rectifier will absorb from ten to twenty volts, and the remainder can be regulated with a small adjustable resistance made of 20 gauge platinoid, or similar resistance wire. The best way is to put an ammeter in the circuit, and then you know how much current is passing through your cells. (4.) Yes, the best way excepting by the use of a motor generator.

The vernier adjustment of the Rudge timing gear. The pinion has twenty-two teeth and the crank pin twenty-one serrations, which gives an adjustment on the 2 to 1 gear of less than half a degree

Overheating.

? (1.) I possess a 1914 3½ h.p. single speed Singer, which is subject to overheating. If I open the throttle when on an incline, it knocks badly. It has a 32 jet in the B. and B. carburetter. (2.) Also the oil is blown out of the crank case with some force through the hollow centre of the adjustable pulley, which hardly allows enough oil to remain in the crank case to oil the engine. (3.) About how many miles to the gallon will a 2½ h.p. Douglas do?—J.G.C.

(1 and 2.) First of all, see that the engine is quite clean of carbon deposit, that the valves are ground in, and that the springs are strong enough. Use good quality lubricating oil and a medium size jet; also see that the gear is not too high. If you look to these points, the engine should not overheat. We should hardly think that an appreciable amount of oil is lost through the crank case relief, which is through the engine-shaft. (3.) About eighty miles to the gallon.

Difficult Starting.

? I have a 1915 5-6 h.p. Rudge-Multi combination, which appears to be in perfect order. Now the only way I can start this machine when cold is by advancing the spark two-thirds, setting the throttle one-third open, the air lever closed, by covering the main air passage with a handkerchief, warming the plug, and removing the belt. I can then start the engine fairly easily with the pedal starter. Now when I replace the belt and start pedalling with the controls set as above, all I can get are loud explosions in the silencer, but I cannot start the engine. The only way I can start when warm is by running down hill and dropping the exhaust lever. I simply cannot start by means of the pedal gear or by running.—H.S.

We cannot understand why you should have to remove the belt before you can start the engine. Everything appears to be in order, and it seems that the real reason—unless there are air leaks at the carburetter or induction pipe union—is the bad quality of petrol we are getting at the present time. There will be some improvement when the weather is warmer, and a little later on better petrol will be on the market; or you might try using benzole. Try injecting a little No. 1 spirit, if you can get it, through the compression tap. If you can get the engine to fire on this it will probably continue on the No. 3 spirit.

A Loose Bush.

? Please tell me if the small bush in which the cam wheel works on a Calthorpe-Jap should be only driven in, or should the aluminium casing be heated and the bush be shrunk in, as I forced it in, and through the weight it has to bear it works loose, although I drove the bush in as tightly as I could drive it with a hammer.—J.P.

The bush should be a good driving fit in the crank case, and if the journal is an easy (but not, of course, too easy) fit it should not move. If, however, it shows a tendency to do so, it should be keyed or fastened with a set screw.

Which Jet?

? I have a $2\frac{3}{4}$ h.p. twin Royal Enfield, B. and B. carburetter. (1.) What size of jet gives best results for speed and economy of fuel with No. 1 petrol? (2.) Size of jet required for No. 3 petrol? (3.) Size of jet required for benzole? (4.) Does benzole give the same power and speed as petrol?—J.D.

(1.) Jet .027, adapter .44. (2.) Jet .029. (3.) Jet .026. (4.) Benzole gives approximately equal power and speed to petrol, but requires much more air. The running is much smoother with benzole.

Silencing a Two-stroke.

? My two-stroke machine is an excellent one, but I should very much like to make it more silent. I have made some experiments with the exhaust, and found that the only efficient method of silencing it was to close the small holes drilled in the end plates of the silencer, and fix a tin on the end of the exhaust pipe as an extra expansion chamber. But I found that as soon as I blocked up these small holes a considerable loss of power was experienced; yet without doing this, whatever else I tried, I could not get any appreciable effect. Could you suggest any method of efficient silencing without too much loss of power? I know that the freedom of exhaust has a very material effect on the running of a two-stroke engine. Either greater or less freedom causes bad running of my engine. For this reason I should like an arrangement by which I could put in and out of action the extra silencing device. This is a question which I am sure would interest many two-stroke riders. Would a large size silencer do the trick without spoiling the running? Please give me a helpful suggestion.—E.G.K.

We fear you will find it impossible more effectually to silence the machine in question. If you do, there will be so much back pressure that loss of power will be the result. A two-stroke is naturally noisy, and cannot well be satisfactorily silenced. Possibly some slight improvement might be obtained by causing your existing silencer to exhaust into a larger expansion chamber, and fitting a long extension pipe. If you fitted a cut-out between the old silencer and the new one, you would then be able to use either the old silencer or the new one, and such a cut-out would be quite legal.

The Two-stroke.

? As I am thinking of purchasing a motor cycle for occasional short week-end trips, and as I think that a two-stroke would suit my requirements, I seek your advice on the following questions: (1.) Would a two-stroke be capable of a twenty-five mile non-stop run, driving at, say, 20 m.p.h.? (2.) Would it not be liable to become overheated during summer months?—M.D.L.

(1.) Yes. (2.) No.

READERS' REPLIES.

Miniature Plugs.

I notice in your queries and replies columns (March 20th) a correspondent asking for information re model sparking plugs. In days gone by I had a great deal of experience in this direction in connection with high-speed model boats, and obtained very successful results by using the centre out of any well-made mica plug and turning it down to fit the smaller body, but there is a limit to the amount of cutting down that can be done, and on the whole it is better to design the engine so that a full-sized plug can be used. I can assure you that both ebonite and vulcanite are quite unsuitable, as, although they might start and fire quite well for a few explosions, the inner end would immediately become charred and form a short circuit. If your correspondent cares to write to me I can probably give him some helpful information in regard to small petrol engines, having been somewhat of a "pioneer" in this direction.—F. G. Arkell.

Four-stroking.

I note your reply to "E.S.R." in "Questions and Replies" in your issue of March 27th regarding two-stroke engines. I own a $2\frac{3}{4}$ h.p. Connaught, to which I fitted an extra air inlet by putting a compression tap in the induction pipe. The effect of this was to increase the speed by about five miles per hour, and almost to eliminate the "four-stroking" trouble. I am now fitting a Bowden extra air inlet valve, and anticipate a still further improvement. The recent correspondence in your columns regarding two-strokes has greatly interested me, and, having owned three within the past four years, I am convinced that the Connaught, Levis, and Triumph two-strokes are far superior in speed, hill-climbing, and comfort, to the various four-stroke lightweight motor cycles at present on the market. I feel sure that the twin two-stroke has a great future when it is perfected, and look forward to the proposed Levis and Connaught horizontal twins.—NORMAN AISH.

Oil Slinging and Loss of Power.

Referring to "G.H.A.'s" enquiry in *The Motor Cycle* of the 15th March, I think my recent experience and remedy may be of help to him and others in similar difficulty. I recently had occasion to fit a new piston to my King Dick engine, and found, on warming up to the work, it suddenly lost power, then regained, and finally lost it, so much as to peter out entirely accompanied by

much slinging of oil past the mainshaft, on pulley side, smothering the belt with oil, and causing the latter to slip badly. Dismantling the engine, I found the top ring partially seized, and signs of gas blowing past the rings. I carefully prised the ring out of the groove, cleared out the carbon, rubbed the ring down on emery-cloth (a new piece of very fine grain) on a perfectly flat surface, and refitted. Result: Perfect compression and sweet running! I have no doubt the blowing past the rings caused much of the excessive oil-slinging, assisted by the absence of the felt washer between the crank case and bearing on the pulley side, which had been chewed up through my having to leave out the steel washer when fitting a new bearing some time ago. So I cut out a thin leather washer to replace it, and, the bearing being now bedded home, I have replaced the steel washer, and all seems to be going well. But why is felt used instead of leather? Is not the latter more enduring? I regularly take *The Motor Cycle*, and glean many useful tips from it. I am much interested in benzole, and have proved that, by using three parts of benzole with one of war spirit, the m.p.g. with sidecar has increased from 50-55 m.p.g. with war spirit to 80 m.p.g. with the benzole mixture; and, with the aid of a Euk quick starter, I can get the engine to fire most times with the first kick of the starter, except on frosty mornings, when a teacupful of boiling water over the induction pipe does the trick.—W. KRINGER.

RECOMMENDED ROUTES.

SUTTON-IN-ASHFIELD TO SKEGNESS.—H.W. Sutton-in-Ashfield, Mansfield, Newark, Leadenham, Sleaford, Tattershall, Spilsby, Wainfleet, Skegness.

PETROL AND OIL.*

HOW THEY ARE TREATED.

THERE is a vast difference between petroleum as it flows from the earth and its derivatives. Between the crude and finished products there is the oil refinery, a region of giant stills, filters, storage tanks, steam and power plants, coal bunkers, and laboratories with their attendant staffs.

Crude oils are not simple chemical compounds, but consist of a physical mixture of different compounds of the element carbon and the element hydrogen. Other elements such as sulphur, oxygen, and nitrogen, various metallic salts, and other impurities are present. Each one of these many compounds has its own definite physical properties, such as fixed boiling point, specific gravity, and other specially distinguishing characteristics.

Hundreds of different hydrocarbon compounds lying between the extreme limits of petrol and the heaviest oil are separated from crude oil by fractional distillation. These products are divided into many different grades, according to their physical and chemical characteristics, and to the purpose for which they are used and shipped to all parts of the world, wherever an internal combustion engine is used, a lamp burned, or a wheel turned.

Crude Oils.

Crude oils may be divided into three main families—those of paraffin, asphaltic, and cyclo-naphthalene bases. There is no sharp line of demarcation between these groups, since most crude oils found in all fields may contain mixtures in variable percentages of hydrocarbons belonging to two or more families.

The crude petroleum is carried from the wells to the refinery by a pipe line. On its arrival it is stored in tanks of large capacity, and a certain settlement takes place. The semi-solids which settle out consist of amorphous paraffin wax, mud, and other earthy foreign matter.

Separation into Groups by Distillation.

From the storage tanks the crude oil is pumped into a large cylindrical boiler called a "crude still." Distillation, as applied to oils, is the separation of the more volatile portions by vaporisation, and their later condensation by passing the hot vapour through a cooled tube. Light hydrocarbons like petrol vaporise very readily, whereas heavy oils form practically no vapours at atmospheric pressure and temperature; therefore, it is necessary to heat and boil crude petroleum in a closed vessel in order to accomplish complete vaporisation and separation of the different hydrocarbons. Since crude oil is a complex mixture of hydrocarbons,

* From "The Story of Petroleum," by C. W. Stratford (an engineer connected with a large oil refining company in America, which appeared in *Popular Science Monthly*, to which magazine acknowledgment is made).

The agitator—a lead-lined tower for bleaching oil and removing impurities.

each of which has a different boiling point, a different temperature is required for the vaporisation of each compound. Dissolved gas and the lightest hydrocarbons pass over first, and as the temperature is increased heavier and heavier hydrocarbons are vaporised.

The lower diagram is intended to show how the vapours are led through a pipe from the still and discharged into the base of the aerial tower condenser. From there

How Pennsylvania crude oil is refined.

they pass up through alternate boxes and air-cooled tubes, where products of different boiling points are condensed and then automatically separated into groups. The lightest products pass completely through the tower, and flow, in vapour form, to a water-cooled condensing coil, where all light hydrocarbons condensable without the application of pressure are liquefied and separated from

First separation of crude oil into groups by distillation.

From Crude Oil to Motor Spirit. The Methods of Distillation and the By-products Obtained.

the remaining vapours, which are further treated at a compressor plant for the separation of very light hydrocarbons from the "fixed" gases.

Of the remaining vapours the heaviest condense upon striking the first air-cooled tube, and the lightest upon striking the last tube. Intermediate products, lying between the light and the heavy ends, condense in the intermediate tubes, depending upon their respective boiling points.

The vapours liquefying in different sections of the aerial condenser fall back into corresponding collector pans, whence each is led by way of a separate water-cooled coil to the storage tanks called "running tanks." The liquids recovered in the collector pans are still at the temperature above their flash points, and it is necessary to cool them down to prevent spontaneous ignition, when they come in contact with air in the running tanks.

Distillation continues until a residue (crude cylinder stock as it is termed) of about 15% remains, when the fires are drawn and the remaining oil is pumped from the still through a cooler into a running tank.

The quantity and quality of products obtained from this first separation depend upon the method of distillation employed and from the base or "family" to which the crude petroleum belongs. This description, however, only concerns Pennsylvania crude oil of paraffin base.

High quality oils are obtained when the separation is made by distilling under vacuum or by the use of fire in combination with steam injection. Due to the mixture of oil and water vapours in fire and steam distillation, oil vapours pass over at lower temperatures than when fire is used

alone. This prevents the occurrence of any serious "cracking" of the heavy products.

Separation and Finishing of First Groups.

The first object of subjecting the group-distillates from the running tanks to different processes is further to separate each group into the final market form of the many groups contained. The second purpose of refining is to remove the impurities, colour bearing, and unstable or unsaturated compounds and free carbon. It may be well to point out at this time that in the first group distillation there is no sharp line of demarcation between petrol and illuminating oil or between any other similar fractions. Heavy constituents are mechanically carried over with the light portions, and more volatile products are mixed with the heavy parts. In order completely to separate these further distillation is necessary.

The crude naphtha distillate is pumped from the running tank to an agitator,

Petro. and Oil.—

where it is heated with sulphuric acid, washed with water to remove the free acid and neutralised with caustic soda, again washed and separated from the water. The heated naphtha is next sent to a steam still, where it is divided by distillation into various market grades of petrol, and pumped from there to the finished naphtha storage tanks.

The illuminating oil distillate is pumped to a steam still, where the crude naphtha contained is separated by distillation and sent to the crude naphtha still. The illuminating oil remaining is sent to an agitator, where it is acid-treated, washed, neutralised, re-washed and filtered through fuller's earth, and pumped to the finished lamp oil storage tanks.

The crude light lubricating oil distillate passes from the running tank to a steam and fire still, for the purpose of changing (by heat) the character of the paraffin wax from the amorphous condition to wax that may be crystallised and for separating the fuel oil content. The lubricating distillate then goes to a chilling tank, where its temperature is lowered to such a degree as to cause

crystallisation of the wax. In this chilled condition it is then pumped to a wax filter press, under high pressure, where it is separated into crude scale wax and pressed lubricating distillate. The latter then goes to a steam and fire still, where the gas oil is separated from it. The remaining distillate is then divided into lubricating oils of different viscosity, varying from very light to medium light, by fractional distillation.

The oils of different viscosities resulting from this fractional distillation are

Aerial condensers for automatically condensing different distillates.

next sent to a fuller's earth filter, through which it passes to the finished paraffin wax tanks.

The crude heavy lubricating distillate follows the same course in processing as that indicated for the light distillate. Fuel oil and paraffin wax are separated in the same manner. The fractional distillation of the remaining oil results in lubricating oils of heavier body than those recovered by the processing of the light lubricating distillate.

Crude cylinder stock is greatly thinned with naphtha, and then sent to a chilling tank, where the paraffin wax, from which vaseline is made, settles out. The oil naphtha portion is pumped to a fuller's earth filter for the removal of colour-bearing compounds and free carbon. From this filter it passes on to a steam still, where it is separated into naphtha and low cold cylinder stock. From the still the oil is sent to a tank, where it is blown with air to remove traces of moisture, and then to the finished oil storage tanks.

Thus are made some of the "oils" with which most motor cyclists are acquainted. It will be seen that petrol is only one of the products of an oil refinery.

RUNNING ON "SOLID" FUEL

An Ingenious Conversion utilising Solid Naphthalene as Fuel.

MENTION has been made on several occasions in *The Motor Cycle* of the possibilities of running a motor cycle on solid fuel. Although we do not anticipate that motor cyclists will discard petrol, now that it is available, in favour of naphthalene moth balls, it is interesting to know that such fuel can be used to propel a motor cycle.

During the petrol shortage in 1917 and 1918, Messrs. Olivos Motors, of Acton, converted a Triumph to run on this fuel; but, since the results obtained were not so good as with petrol, and the cost considerably higher, it is not anticipated that other readers of *The Motor Cycle*

will follow the plan of the inventors of the device which we illustrate.

The machine is fitted with a wooden "tank" of considerable width, the left-hand side of which contains the petrol and oil tanks, while the right-hand compartment is arranged to carry the moth balls. In the lid is a door through which the driver can feed the moth balls into the partition immediately above the vaporiser—a procedure which is necessary every ten or fifteen miles.

The machine is first of all started on petrol, but, of course, a blow-lamp could be used to melt the naphthalene if desired. Five minutes after the engine has been running on petrol there are symptoms of choking and eight-stroking, when the petrol may be turned off and the rider can continue on the solid fuel.

There is no carburettor proper, the petrol being introduced into the induction pipe between the naphthalene chamber and the gas throttle, any excess running into the hot air pipe.

The power developed from naphthalene is about equal to that of coal gas, about 75% of that of petrol.

The vaporiser contains about half a pound of naphthalene, and as the approximate cost of running on this fuel is 6s. 9d. per eighty miles, it will be seen that it is not by any means a cheap fuel.

The accompanying drawing gives a pretty clear idea of the naphthalene vaporiser and renders it self-explanatory. It will be seen that the principle involved is to melt the naphthalene by means of heat from the exhaust. When the fuel has been reduced to a liquid state, hot air drawn through the air pipe bubbles through it in much the same way that air bubbles through the old type surface carburettor. Curiously enough, in

running on this fuel it is found beneficial to control by the air lever. There is plenty of carbon deposit while using naphthalene, but no knocking—the latter only developing when petrol is used.

As will be seen from the illustration on this page, the lagging of asbestos string by no means improves the appearance. However, as a temporary measure, it was distinctly better than having no fuel.

Diagram of the arrangement for storing and melting the fuel.

View of the conversion much camouflaged by lagging.

17 Years' Experience is
behind the B.A.T. That is one
reason why you should enquire
about it.

"TANKETTE"

(British Throughout).

THE WORLD'S FIRST SUPER SCOOTER.

FOR LADIES, GENTLEMEN, AND BUSINESS PEOPLE OF ALL CLASSES.

Complete freedom from MUD, DUST, HEAT, DIRTY OIL OF ENGINE. etc.,
Perfect ease of control, whether riding in traffic with your side wheel
runners down, or in the country with them up.

WHY WEAR UNGAINLY OVERALLS?

Absolute comfort and reliability, combined with POWER, STRENGTH,
LIGHTNESS, and COMPACTNESS.

The "TANKETTE" will give you ALL this, because it has SPRING
FRAME, FREE ENGINE, TWO SPEEDS, NO SADDLE but a comfortable Seat,
and complete Mudguard Protection.

PRICE NOT YET FIXED, BUT IT WILL BE

UNDER FORTY POUNDS!!

DON'T DELAY. Put your name on our waiting list now, and enjoy
the golden leisure hours of Summer.

DELIVERIES BEGIN FIRST WEEK IN MAY.

"TANKETTES" c/o RONALD TRIST & CO., LTD.,
CORONATION HOUSE, 4, LLOYD'S AVENUE,
LONDON, E.C.1.

A.J.S.

Replenishing in the 1914 Junior T.T. Race!

Only replenishing stops, no involuntary stoppages that day — no tinkering by the way, but "at it" all the time, and in the end—1st, 2nd, 4th, and 6th positions!

You read in that performance a reliability unequalled—a mechanical perfection unexcelled.

No involuntary stops, that's the point—and applied to YOU on Tour it means that feeling of absolute confidence so essential to complete enjoyment even when "you're miles away from anywhere"—if you ride an A.J.S.

The A.J.S. Engine is made entirely at our own Works, distinguished for power, flexibility, silence and absence of vibration, and stands to-day a masterpiece of BRITISH engineering skill and thoroughness.

The A.J.S. incorporates 3-speed Countershaft Gear, Hand-controlled Clutch, Kick-starter, Patent Gear Change, All-enclosed Chain Transmission, Internal Expanding Rear Brake, A.J.S. Patent Detachable Interchangeable Wheels, etc. But let us send you our preliminary List with fuller information.

advance list, please send for it.*

COVENTRY PREMIER, LTD., COVENTRY,
And Bristol House, 19-20, Holborn Viaduct, LONDON, E.C.

When the R.F.C. was first formed, the War Office held exhaustive tests of the leading English motor cycles. As a result, two types were chosen, one being the P. & M.

A few months' use conclusively proved the superiority of the P. & M., which was then adopted as the standard R.F.C. Motor Cycle. This was before the War.

The P. & M. is now used exclusively by the Royal Air Force.

The P. & M. was used on every front without a single weakness coming to light, and no motor cycle has such a fine record of war service to its credit.

It was the only 500 c.c. machine which stood the strain of sidecar work.

This model is now available to the public at the exceedingly low price of £78, and in view of the high standard of workmanship and finish it is

The best value in motor cycles to-day.

The Import of Foreign Motor Cycles.

IN our issues for the 10th and 17th inst., we gave exclusive forecasts regarding the decision of the Government concerning the importation of foreign motor cycles. These forecasts were founded upon such reliable information that they have proved to be entirely accurate, and we are now able to announce that the prohibition on imports is to be withdrawn and importation restricted to fifty per cent. of 1913 imports until September 1st this year.

The announcement of the Board of Trade on this matter states also that the importation of forgings and castings for motor vehicles is to be similarly restricted. In both cases licences will be issued in proportionate monthly quantities, but in the case of spare parts for renewal purposes for machines already on the road, these are to be admitted freely under licence. The prohibition on motor scooters is to be maintained.

The wording of the official statement is somewhat ambiguous, and there appears some uncertainty in connection with what is meant exactly by a paragraph which refers to the licensing in proportionate monthly quantities. If a certain firm imported 1,200 motor cycles in 1913, presumably this concern may import fifty per cent. of five-twelfths of this number (i.e., 250 motor cycles) between April 1st and August 31st this year. Government announcements are often obscure, and it is possible that a supplementary explanatory notice may be eventually issued by the Department of Import Restrictions of the Board of Trade.

Although no mention has been made of the duty to be paid on motor vehicles coming into this country under these regulations, it is safe to assume that this will remain at 33⅓% until that figure is amended by Act of Parliament.

So far as British manufacturers are concerned, the limited imports, especially if the duty be retained, cannot have any serious effect upon their business, except, perhaps, that the removal

of the prohibition may tend to accelerate outputs all round, in order to be fully ready for a possible removal of the restrictions in September. The possibility of even a limited number of imported machines being available in this country in the near future will go a small way toward alleviating the present shortage of motor cycles.

Sales of Army Motor Cycles in the Provinces.

WE have several times urged that it would only be fair to the taxpayer generally, and motor cyclists in particular, if the Government could see its way to hold some of the forthcoming sales of surplus Government property in provincial centres as well as in London. We return to this subject, as it is a question which a large section of the public is asking, and therefore it is one to which the Department concerned should give immediate attention.

There is a feeling in the provinces that London buyers only are to be given the opportunity to purchase the surplus stock for which provincial taxpayers have paid just as heavily as those residing in the London area, and we think that the former should be given convenient facilities for examining surplus Government motor vehicles, and, incidentally, participating in the bidding for the machines.

Buildings as suitable as the Royal Agricultural Hall are to be found in most provincial cities, such as Birmingham, Bristol, Glasgow, Liverpool, Leeds, Manchester, Nottingham, etc., and there is no doubt that the amounts realised would in every way be equal or even superior to those obtainable from London buyers.

Probably there are certain difficulties in connection with the transportation of the goods, but even for London sales the machines have to be loaded at the depots and unloaded at the sale-rooms, and to carry out sales in the provinces would only mean that the distance between the two would be slightly longer.

Occasional Comments by "Ixion"

3½ h.p. Single-cylinder Two-strokes Coming?

I HEAR by a side wind that the advance registered in air-cooling during the war has rendered a satisfactory 500 c.c. single-cylinder two-stroke practicable, though I have no definite information that one is to be put on the market. Readers will remember that in the old days a 350 c.c. two-stroke was about the outside edge of the absolute limit for air-cooling, and that some of these were easily tempted to melt their sparking plugs or parboil their top rings, so that A. A. Scott had to branch off into twins and fit a radiator when he needed plenty of kick from this type of engine. If such an engine materialises, it should be a cheap production job, well-suited to the popular machine of which I have already written.

Prejudice and Propaganda.

QUITE a pathetic little note just to hand from New Zealand. My unknown friend has booked a British flat twin for 1919—note well, ye traders, not because he really wants one, but because his favourite Indian is now quoted at £135 in his township. Consequent on the placing of this order he has just received a back number of *The Motor Cycle* in which some correspondent remarks that flat twins are noisy, inflexible, give a lot of trouble, require frequent gear changes, and collect tons of mud. So my correspondent is in the dumps, and is on the verge of selling an extra 100 sheep and buying an Indian after all.

Of course these two sad cases—i.e., the New Zealander and the critic who has put the wind up him—are really subjects for the attention of Mr. H. A. L. Fisher, Minister for Education, and not for a mere motor cycling scribe. However, when the great neglect their duties, the mean man must step in. Let us analyse the statements, and it will be clear that the critic ought to have known he was talking through his hat, whilst my N.Z. friend should surely have spotted it also. Item one—"flat twins are noisy." All motor cycles are noisy, but in any class, e.g., the 500 c.c., the flat twin is necessarily the quietest, for each of its barks is a 250 c.c. bark, as compared with the 500 c.c. barks of a single: and as compared with a 500 c.c. V twin, its barks are even instead of being irregular. Item two—"flat twins are inflexible." The exact accusation cannot be identified, but presumably our authority has committed the grievous crime of tautology, and means they require frequent gear changes. After twenty years of motoring everybody is supposed to know that there are two main types of petrol engine—low speed and high speed. The high speed type wants a lot of gear lever, the low speed type does not want quite so much. Both are grossly "inflexible," as compared with a steam engine, which does not want any gear lever at all. The critic presumably means that a flat twin wants more gear lever than a V or a single of the same c.c. This is not true as it stands. The 2¾ h.p. Douglas went

through an End-to-end trial some years ago on less gear lever than most of the 3½ h.p. singles engaged. It is true that the average modern flat twin wants a lot of gear-lever, the reason being that the beautiful balance of these engines permits them to be revved up to 4,000 r.p.m., whereas if you tried such stunts with a single or a V twin, the carrier would twist round and smash the head lamp.

The Indictment Continued.

I TEM three—flat twins give a lot of trouble. Tut, tut, gentlemen. Surely even a 6¼ hat knows that the flat twin is by now as much an established type as the vertical and the V. Well, if a type is good enough to survive in open competition, you may take it that the trouble it gives is dependent, not on the peculiarities of the type, but on the design, material, and workmanship embodied in any given sample. If a type is inferior, its number is up. Tube ignition vanished—because it was a bad type. Accumulator ignition vanished—because it was a bad type. The magneto survived—because it was a good type. The flat twin made its *début* when the vertical and V were established, and cut into their annual sales to the tune of 25,000 machines because it was a good type. But you cannot generalise about all the different makes. I have had flat twins which never gave any trouble, and I have had others which gave nothing else. It is just like marrying a wife or buying an ounce of baccy—you must exercise judgment in selection. Item four—flat twins collect a lot of mud. What is the animus here? I suppose our anonymous critic means that if you buy, e.g., a Triumph, the bottom of its crank case is in the line of mudfire and is easy to clean; but that if you buy a flat twin, its cylinders field the flying "clarts" (as the Durham boys call them), and cylinders are not easy to clean. Well, this might be true if flat twins kept their cylinders where the Triumph keeps its crank case, but they do not. As a rule the cylinders of a flat twin are mounted pretty high up, and the machine has a front mudguard of sorts. Oh! dear. I can pardon a man for writing reams of glib nonsense—I am by no means guiltless myself; but it is just the absence of that analytic mental quality which recognises hot air as hot air that has established the Soviets in Russia. Do not let it invade motor cycle politics, please.

Wanted, a Ford Motor Bicycle.

AT the present moment the ranks of the less well-to-do motor cyclists are full of bitterness and disappointment. My postbag threatens to ignite His Majesty's mails, so warm are the letters of complaint which it contains. During 1919 it will probably be impossible to obtain a sensible touring machine at less than £80, and there is not one symptom of any change in 1920, unless supply overtakes demand, and with the cessation of much very natural profiteering-second-hand machines of pre-war

Occasional Comments.—

and war origin slump down to their intrinsic values. Will somebody please do for the motor cycle what Ford did for the car, *i.e.*, concentrate all the energies of first-class design and first-class production methods to evolve a roadworthy mount at a minimum price? I am glad enough to welcome all the refined four-speed machines with electric lighting and other luxuries. In the public interest I could spare the lot if some genius would produce a simple, sound touring machine at £25 or even at £40. I should be apprehensive if a £50 car appeared—there is not safe room on our present roads for the millions which would sell. But, given certain rational stipulations prior to the issue of driving licences, our roads would accommodate illimitable numbers of motor bicycles.

How to Cheapen the Motor Cycle.

THERE are three ways of cheapening our machines. Output is the first. Design is the second. Scientific manufacture is the third. The middle item is the culprit behind high prices. Nobody has ever planned mass production of a single specification designed from stem to stern in the interests of economy. The most superficial examination of our motor cycles betrays two facts about them as a class. Not all of them are "designed" in any real sense of the word. Not one of them is designed with an eye to minimum price. A single-cylinder two-stroke engine of about 400 c.c. and a two-speed gear of the simplest character are prime essentials in the £25 motor bicycle. Steel pressings must obviously replace all the innumerable lugs and bolts and hand jobs with which all existing machines bristle. The wheels must—probably—be single discs spun over a rim. The tank, gear box, and crank case must be integral with the frame pressing, and so forth. This job will tax the brainiest engineer in the country—it is a far tougher problem than the production of a £50 car, Ford's newest stunt, for you cannot save weight of material or reduce the number of parts, or cut down dimensions. It can be done, and it will be done. If

it is done quickly it will be a *political* achievement of the first water, and the doer will deserve a peerage. At present the wealthier amongst us scour out the cobwebs from our brainpans at week-ends by a trip to the sea, or a couple of rounds of golf or a jaunt in a car. The poorer among us—who contract *more* cobwebs—have no relaxation but a few hours on the allotment, or in a cinema, or at a league gladiatorial show: and such recipes are inefficient.

Gyroscopic Action of Transverse Flywheel.

I SEE one of our correspondents has resurrected the old bogey of a flywheel rotating at right angles to the track, pinning a machine to the straight-ahead path and obstructing turns. It may be perfectly true that the writer's four-cylinder F.N. dislikes a sharp turn at an engine speed of 6,000 r.p.m. or so, but it would take a great deal to convince me that gyroscopic action of the flywheel is a perceptible factor in this reluctance. After all, racing cars with heavy flywheels spinning at very high speeds manage some fairly abrupt corner work. Anyhow, I have now had a chance of trying the 3 h.p. A.B.C., and cannot detect the least reluctance on its part to take a sharp bend at speed.

A Problem for Readers.

THIS is a tale of an awkward diagnosis with which a tourist faced a roadside repair shop on the stand and deliver lines. The tourist teetered up to the big glass doors with the engine purring like a large tomcat after its third fresh herring. As the rider cut out the engine, the machine kind of baulked. The manager sauntered out into the road, and the rider explained that the machine would run perfectly when once started; that it was uncommonly hard to start; and that it pulled up very suddenly, almost as if it had seized, whenever the engine was cut out. The garage staff and one or two interested riders tested the machine on the road, and found it was even as the rider had said. What was the matter with it? The machine was a Douglas, and I hold up the solution for readers to show us what they can do.

Competitors at the start of the Manchester club's recent speed-judging competition. This well-contested trial took place over a course of twenty-five miles. The motor cycles shown include a Douglas, Levis, Triumph, and Indian.

The sidecars and solo mounts used for the demonstration. Reading from left to right, Messrs. F. Hulbert and G. E. Stanley, Mr. M. J. Schulte, Mr. T. C. Pearson, and the Editor of *The Motor Cycle*.

WHILST some manufacturers are hustling to produce their present year's designs, it is surely something extraordinary to have 1920 models on the road. Naturally, the motor cycles to which we refer are but forerunners of the new design, but the fact of their being ready at this stage affords another instance of the jealous care with which leading manufacturers guard their good name. Too much secrecy in the past has prevented motor cyclists appreciating to the full with what caution and thoroughness any new feature or design is tested under all conditions, months before it is intended to be offered to the ordinary public. Reputations are not made in a month or a year, but they can be dashed to the winds by one outstanding error. It was the luck of but few manufacturers to emerge from the war ready or nearly ready to continue their staple trade. Douglas, P. and M., Triumph, Clyno, and Sunbeam, by reason of

their motor cycles having been selected by one or other of the Allied Governments, were in that fortunate position—were it not so, the dearth of new motor cycles would be more pronounced to-day than actually is the case.

New Models under Test Again.

The incidence of the war broke a spell of spring-time tests which we of *The Motor Cycle* were in the habit of making each year, but happily, these exhibitions of road-worthiness have now been renewed—instance the trials of the new A.B.C. and the modern Rex referred to in recent issues. Our present notes refer to Triumph products, the company having invited the writer to complete a quartet of motor cyclists on hill-climbing bent. The machines were rather a mixed lot. Two had Triumph three-speed gear boxes and sidecar attachments, one was an all-chain-driven solo mount

G. E. Stanley astride the 1920 model chain-driven Triumph. This machine is fitted with the new type spring fork (details inset) and the new Triumph three-speed gear box, in which is embodied an extremely efficient shock-absorber.

Testing 1920 Models.—

geared $4\frac{3}{4}$ to 1 on the top ratio of its three-speed gear, and the fourth machine was the simple single-gear belt-driven solo mount described in the Spring Number of this journal. The first objective was that happy hunting ground now so well known to our readers—the Edge Hill Range. The sidecars—piloted by G. E. Stanley and T. C. Pearson—formed the vanguard of the party, F. Hulbert and the writer following later on the solo mounts.

With Hot Engines.

It has come to be regarded as a classic test route in the Midlands to travel to Edge Hill at a "warm" pace and straightway make the ascent of the half-mile or more of 1 in 6 gradient. Not that failure is frequent nowadays; the test is more to determine the gear that will most satisfactorily perform the allotted task, and the speed and vim of the engine in its culminating effort on the single-figure gradient. Need we say, therefore, that every machine made light of the hill? Rather should we state the gear ratios and speed attained. The coachbuilt sidecar outfits, with their $5\frac{1}{2}$ to 1 top gears, surmounted the first portion on top, the second speed of $8\frac{1}{2}$ to 1 being more than sufficiently low for the rest of the climb, for the trusty (did we hear someone ejaculate lusty?) singles "roared"—one may justly apply the hackneyed term—over the summit at a speed of 20 to 25 m.p.h. Closely following were the two soloists

readily accepted by the engine without any exhibition of distress.

Later at Sunrising, the chief interest centred upon the ability of the single-gear mount with its $4\frac{3}{4}$ to 1 gear to pick up after rounding the hairpin bend. But there need have been no doubt on that score, notwithstanding the slow down for the corner, for its $11\frac{1}{2}$ stone rider was literally catapulted over the crest of the rise at a speed well in excess of the legal limit.

There was nothing further to be done, for Edge and Sunrising are the steepest gradients within easy reach of the City of Motors, so the trip was continued to Stratford, where, at lunch, discussion centred upon single, V, flat twins, aluminium pistons, and what not. The air was petrolic, and Hulbert and Stanley were at their best—that was worth something to a mere journalist.

1920 Features of Design.

But the reader will naturally be asking about the 1920 features! It would be exhibiting undue impatience to expect to know too much now, for examples of these new Triumphs will not be available for months yet—except, of course, the single-gear sporting mount, which, Mr. M. J. Schulte informed us, will be ready for delivery in limited numbers almost immediately. And so here is a chance for the nimble motor cyclist who looks twice, perhaps thrice, at £87 10s. for a three-speeder, and so decides to wait.

As regards the change-speeders, it is obvious from the fact that three of the four machines used on the trip had an all-chain drive that the Triumph designers—as well as their road-burners—now favour this form of transmission for passenger work.

The positive form of drive is used in conjunction with a spring drive shock absorber of remarkable

—Hulbert on the chain-driver making light work of the hill on top gear, the belt-driven mount, likewise geared $4\frac{3}{4}$ to 1, and no "change-speed," also making no mistake. By mutual consent at the hill summit the new Triumphs do rev. some! Interchange of mounts followed, but it was always the same result, easy ascents on middle gear for the sidecar mounts, and speed climbs on top for the soloists.

A Severe Test.

One test of the new clutch and gear was a restart on the steepest section of Edge Hill with five passengers clambered over the sidecar and luggage carrier—gross ill-treatment which was

(Top) Testing the clutch. A restart was made with five passengers on the steepest part of Edge. (Bottom) An unposed group at the crest of the hill.

efficiency, which G. E. Stanley has had under test for nearly two years. It is embodied with the countershaft clutch, the multiple plates of which are alternately phosphor bronze and steel. By means of the spring tension upon these plates, undue snatch is impossible. Take, for instance, the case of the throttle being suddenly swept open. The effect is to cause a momentary slipping of the plates, and then the drive is gradually taken up.

The new clutch is incorporated in the Triumph three-speed ball bearing countershaft gear box, the result of prolonged experiments. Changes can

Valve side of a new model single-gear 4 h.p. solo mount, which is announced by the Triumph Cycle Co. as being ready for delivery in limited quantities.

completely enclosed in an oiltight aluminium casing, but the rear chain is left exposed except for a guard over the upper portion, which is discernible in one of the accompanying photographs. Two of the machines were equipped with the new Triumph spring fork, which, though working on the same principle as formerly, is cushioned in its action by a coarse thread formed on the guide, which should eliminate spring breakages and all bouncing tendencies on rough roads. A neatly designed casing completely enclosing the spring enhances the general appearance.

Again, it should be added that these new designs are still undergoing extensive road tests, and buyers can hardly expect to see the perfected patterns offered as standard until Olympia. G.S.

(Top) The chain-driven sidecar ascending Edge Hill in good form.

(Bottom) F. Hulbert bringing up the new chain-driven Triumph at over 30 m.p.h.

be effected with impunity, either on the clutch or valve lifter. Novices may cheer up, for no harm will result if they forget both! In changing, although the gear

ANOTHER MIDLAND OPEN TRIAL.

THE Midland Cycling and Athletic Club is holding a big "One Day" open trial on Saturday, June 28th, in the Midland District. Three classes will be catered for—the "passenger" machine, the "solo" machine, and the "lightweight"; lightweights to include all machines up to and including 350 c.c. For each of the separate classes there will be a perpetual trophy, given by various members associated with the big Midland organisation, while for the best performance of the day a special trophy will be awarded, known as the "M.C. and A.C. trophy."

Club gold medals will, of course, be given to all competitors gaining full marks. An interesting feature of the event will be the award and special prize for the best performance on a machine of 275 c.c. or under; while other special prizes include awards for the best performance by a private owner for any class of machine, and for the best performance by a member of the club. The usual entrance fee will be charged—£1 1s. for non-members, and 10s. 6d. for members.

Entry forms may be obtained from the hon. secretary, F. J. Urry, Lionel Street, Birmingham.

OVERSEAS SECTION.

A Commentary based upon Practical Experience and a Study of Overseas Opinions.

Exports Increasing. THE tide has turned, and the number of British motor cycles exported increases month by month as manufacturers are resuming the production of motor cycles. In January, the exports in motor cycles and parts were valued at £41,301, February £114,266, and March £154,202. While not very large figures, they are decidedly encouraging, considering that the largest manufacturers are only just now commencing to deliver. The enormous demand for motor cycles in the Home country will no doubt have a retarding effect upon exports generally, but we think there are many manufacturers who will look a little further ahead than the moment and endeavour to distribute a fair share of their outputs Overseas.

Overseas Models. ALMOST every new model reviewed in *The Motor Cycle* reveals the genuine interest the manufacturers have in the

Overseas markets—if not for immediate exploitation, then for future campaigns—and it is anticipated that very few passenger outfits at next Olympia will have tyres less than 28in. x 3in. The first of the new single-cylinder sidecar machines produced for post-war trade, which was reviewed in last week's *Motor Cycle*, has a ground clearance of 5½in., 28in. x 2½in. tyres, and mechanical lubrication. It was designed throughout with full appreciation of the demands of the export trade, and no doubt many other similar models will appear during the year. 28in. x 3in. tyres are almost general now on twins of 5-6 h.p. and upwards, and it is safe to say that ninety-nine per cent. of the makers are experimenting with spring frames. The buyer of motor cycles from abroad who visits the Olympia Show in November next will, for the first time, find that the *majority* of the machines exhibited are in every way suitable for all conditions of roads.

Sidecar Bodies. OWING to the cost of freightage the price of imported sidecars in the Overseas markets is likely to be high for some time to come, and with this in mind certain American sidecar manufacturers are introducing specially designed sidecar bodies which are shipped in finished sections and assembled by the retailer abroad. Although not new, this "knock down" system, as it is called, has much to commend it at the present time, and it would well pay British firms generally to go into the matter. Packed in sections a sidecar body is very compact, and if produced by or for a firm shipping sidecar outfits, the case required for the sidecar chassis, the motor cycle, and the "knock-down" body would

be little larger than the present cases in which motor cycles only are packed.

The Machine for the Native. THERE is undoubtedly a huge business to be done by some enterprising manufacturers who will design a simple fool-proof lightweight specially for the middle-class native of countries in the East. A letter on this subject from a correspondent in India is published in this issue, from which one gathers that a high-speed would not be an essential; in fact, it is suggested that a maximum of 25 m.p.h. should not be exceeded. Such a machine would have to be cheap, light, and absolutely reliable, and leave little which is open to readjustment by natives with an inquisitive mind.

A low compression two-stroke engine with fixed ignition and low geared with belt drive would probably meet the requirements of the native rider. Ground clearance should be high and saddle position fairly low, but as cost would be the first consideration the springing would have to be provided by oversize tyres, say, 26 x 3in., and a well-sprung saddle.

In designing a machine for this special market the maker would have to dismiss from his mind past standards of refinement and finish, in which connection it must not be thought that the native intelligence is fascinated by fancy colours and a lavish display of nickel-plate. The average native of India, for example, is suspicious of a glossy finish and bright colours, and he knows insufficient of motor mechanics to judge the merits of a machine excepting upon performance. A cheap, plainly painted, plain looking, easy-to-control motor cycle, handled in a straightforward manner in the East would undoubtedly appeal to the native mind, and the firm who caters for this market in the near future will have a lucrative field to himself.

Literature in Foreign Languages. WE understand that several large manufacturers of motor cycles have in hand preparations for issuing their catalogues printed in several languages. In the past very few makers have done this, and the fact that the matter is now receiving consideration adds to the evidence that the British motor cycle industry will not be so apathetic concerning the Overseas markets, as, apparently, it has been. This enterprise should be carried a step further, and instruction books issued in various languages. Likewise any instructions, usually printed on the tank, should be in the language of the country into which it is exported.

A Selection of Letters from Readers scattered all over the World.

An Australian's Appreciation.

"MECHANIST," of the First Australian Wireless Squadron, A.I.F., writing from Bagdad, says: "Have just received your 'Peace' number, and with you and your readers am looking forward to a new era of prosperity for the 'good old hobby.' I have been a close student of your paper for nearly eight years, and can appreciate the publicity you have given to the wants of us colonials, and the encouragement you have given to the movement in general.

"On this front the 'Dugs' have done the brunt of the work, and, in my opinion, are the more suitable machines for the job. Recently only Triumphs have been issued, and have done well. The old trouble of insufficient mudguard clearance is still our bugbear with both machines. Three inches would not be too much, and would give one a chance to scrape it out every mile or so.

"With the Triumph we are continually bumping the crank case and silencer on bumps and ridges across the road, and bending the footrests. Then, in fording streams and water-holes, the 'Dug's' magneto position gives it a preference, and I have often seen Triumphs left behind to dry out the 'mag.'

"In Australia, where petrol has not yet been short, though slightly dearer than in pre-war days, the demand for machines will be very great from this on, and I trust the British manufacturer will be able to get in early, and cater for this demand, and not let his American cousin get the upper hand, as he has been threatening to do lately. The English 'jigger' is undoubtedly more economical to run, and wears better. All we want are suitable models at a reasonable price.

"The specifications of the new A.B.C. seem nearly ideal to me for solo work, provided the figure is not too high.

"Our tax in Victoria is now 10s., or, with sidecar, £1, for all powers."

Motor Cycles for the Natives of India.

MR. J. N. OLIPHANT, writing from Kheri-Lakkimpur, U.P., India, says: "I read with much interest the article in your issue of January 2nd, entitled 'Rolls-Royce and Ford Models,' chiefly in reference to the latter. I should think there would be an enormous field for the cheap quantity produced motor cycle in India, provided the requirements of the market were carefully studied. Road conditions are abominable for four-wheeled traffic (I speak particularly of Northern India) and the mileage of metalled roads extraordinarily small; but many unmetalled district roads provide quite tolerable going for a cycle or motor cycle. Travellers on foot proceeding in the traditional 'Indian file' wear out paths on the earth road surface which eventually attain the smoothness and hardness of concrete. Nothing but the rather tortuous character of these, and the fact that nobody worries to remove occasional obstructions, prevent a very fair speed being maintained.

"My job as a forest officer entails the maintenance of a large number of roads, and many of these have been brought during the last two or three years into quite decent condition for motor traffic by the simple expedient of preparing tracks on which the foot passenger is encouraged to walk. He is, fortunately, not so perverse as to pursue the usual winding course if a straight track is prepared for him. I use these roads principally in a Ford car, but knock about to a certain extent on an ancient and battered 3½ h.p. F.N. The former is better for the liver than the motor bicycle, but the latter is very long suffering. The forest staff and forest contractors are rapidly taking to push bicycles, and many of them would purchase motor bicycles if a suitable mount were available at a reasonable price. India is at present in the push bicycle phase, and no motor cycle manufacturer is going to break records as regards sales in this country unless he can produce a machine which will appeal to the Indian public—the European element hardly counts.

"The author of your article has got, in my humble opinion, very close to the requirements for a machine which would be popular here. 'Handy, reliable, foolproof,' and the greatest of these is foolproof. The Aryan brother is not gentle with machinery, and neglect would be the rule rather than the exception. Finish is a relatively minor consideration. The Indian mind would regard high finish with suspicion, as a species of camouflage. As to speed, while the Indian chauffeur often is imbued with the spirit of Jehu, I do not think it would be wise, in view of road conditions, to let

loose on the Indian public anything capable of more than, say, 25 m.p.h. The safe pace on unmetalled roads is more like 12 m.p.h. Lightness is essential for such roads. I wrestled for some time with a rather heavy 3½ h.p. machine, but it beat me. Having no experience of two-strokes, I incline to the established imperturbability of the four-stroke. Automatic lubrication, automatic carburettor, fixed ignition, and good clearance seem desirable points. A good silencer is also important in a country in which it is not unusual to look round and find the horns of an infuriated bullock toying with one's mudguard. The *patpataka*, a name onomatopoeically bestowed on the motor cycle by the villager of these parts, seems to have a peculiarly exasperating effect on horned cattle. True, many Indians would probably resent the absence of noise, and remove the silencer—that would be their affair. Two speeds are essential. I think a clutch could be dispensed with. As to drive, I have not sufficient experience of modern developments to express an opinion. The shaft drive suggested by 'Chinook' sounds attractive. As good springing as possible consistent with general sturdiness. After all, the Indian wheeled conveyance is not noted for efficiency of springs. High-tension magneto, I think. The application of the Ford type to the requirements of a lightweight would surely be difficult. I do not know if it would be too much to hope for a machine such as described to be retailed in India at a price in the neighbourhood of £20, or £25. A higher price would probably scare off a large proportion of middle-class custom."

Business Energy and Enterprise.

An ANZAC at present in London writes on the subject of the popularity of U.S. machines in Australia:

"As an Australian at present stationed in London, may I be allowed a few words on the frequently recurring subject of English and American machines for Colonial use, and, as recently pointed out in your columns, a factor that has largely influenced the sales and popularity of the American machine has been the thorough and businesslike manner in which their agencies have been conducted.

"To go back a few years to the time when the 3½ h.p. single was the goods, the English motor cycle, imported as a complete machine or locally built up of component parts, easily held the market; in fact, there never was any serious competition as to the supremacy of the British single, but when motorists commenced to enjoy and appreciate the power and pleasures of the twin we had to look elsewhere for a machine at a reasonable price, and America stepped in and filled the breach, and gave us of its best, and the price was right, too. New the twin J.A.P. was ever a warm favourite, and considerable numbers were built, and as single-gear solo and sidecar mounts achieved great success and invariably gave complete satisfaction, but with the advent of such luxuries as gear boxes, clutches, chain drive, etc., up went prices, and an English twin so equipped was worth a lot of money, but handled as a side line in sample lots it was not worth £30 to £50 more than an American, and, what is more, the Yankee made good, and now there are other considerations besides cost that influence a man to buy and ride a heavy American twin.

"With the push and go that characterise American manufacturing methods, it was plain that from the jump they were out for business, and, with the services of our best riders, took a prominent part in competitions, and in speed and reliability events soon established a firm footing, and to-day we find the American twin the popular machine both for solo and sidecar work, and whilst the British-built twin will always find a host of admirers and a few buyers, it will need a very vigorous and up-to-date policy on the part of manufacturers to popularise it amongst riders in general, and with all their energies at present devoted to supplying the home market with new old models, and waiting lists, we can hardly expect an English invasion for a year or two, and it is not much use telling a man 12,000 miles away that it will be worth waiting for.

"On different occasions during the past four years I have had many pleasant days motoring in the North of England, and undoubtedly the main roads are a treat and much superior to our roads, but the best scenery and the most interesting runs are not to be had on main routes, and it is when we get on to the side tracks that the need for stronger wheels and better springing becomes apparent."

THE COULSON "B" ON THE ROAD

A Run on a 3½ h.p. Rear-sprung Model with Outside Flywheel.

WE have already described the Coulson "B" in *The Motor Cycle*, but we may remind our readers that its principal features are its Blackburne engine, which accounts for the "B" in the title, and the system of rear springing, which consists of a pair of leaf springs anchored to the forward end of each chain stay, the ends of which are connected by links to the special rear wheel carriers hinged on to the rigid portion of the frame. The particular model tested was absolutely in the rough, and quite devoid of such refinements as first-class finish and enamelling, but it sufficed to give us an excellent impression of both the springing and the Blackburne engine, which latter was the well-tried 3½ h.p. type (85 mm. x 88 mm.), and not the 2½ h.p., which was not ready for delivery.

Over London Roads.

The machine was handed to us on a recent Saturday afternoon, which happened to coincide with the opening run of the newly-revived Public Schools M.C.C., and came in handily for attendance at that function. It was not long before we came to the conclusion that our next mount should have a spring frame and single lever carburetter. The Coulson was fitted with a Capac single lever carburetter, which was quite delightful in action, and gave all the power and acceleration which could be desired, though, owing to its being set rather finely, it rendered starting from cold rather difficult.

Esher, the rendezvous of the P.S.M.C.C. boys, was reached without incident, and then the merry crowd proceeded to Newland's Corner. Just after the start we were delayed by a choked jet; but after it had been cleared, a swift journey ensued to the famous view-point, and a fine ascent was made of the steep hill lead-

The 3½ h.p. Coulson B on which the test was made.

ing to it. The Coulson literally took hold of the gradient, and soared to the summit at a good swinging pace. A fine run was made back to the Hut.

It was very pleasing to see Clive Preen once more, who so ably performed the duties of honorary secretary up to 1914, and who arrived in the treasurer's Harley-Davidson sidecar. He has been serving as Trustee of Enemy Property in Egypt for the last three years, and has suffered considerably in health.

Testing the Rear Springing.

Our return journey from The Hut to a point some distance north of London was a most interesting one, as every variety of surface was traversed. Leaving the Portsmouth Road half-way between The Hut and Cobham, we turned to the left and struck the Weybridge Road, where the first portion has been absolutely destroyed. The machine took this rough surface, inches deep in mud and ruts, with wonderful steadiness.

People must bear in mind that it is not reasonable to expect that on a spring

frame machine the bumps will not be felt at all. It must be remembered even on a well-sprung car the road vibrations are felt, but to a lesser degree than on an unsprung vehicle. Now, in the case of the Coulson, the springing was good, and there was an absolute absence of those nerve-thrilling bumps received by the rider of an unsprung motor bicycle even if he be seated on the most comfortable saddle, and over this terrible road surface the machine was thrown about so badly that we were almost unseated.

From Weybridge through Chertsey to Staines the going was very good on the whole, though rough patches were occasionally encountered, and the ease with which the machine rode over the uneven surface was a real pleasure. From Staines we proceeded to West Drayton.

No Road!

Just outside West Drayton Station the road has disappeared altogether. The mud was inches deep, and of the pea-soup variety, while lakes many feet across abounded, and goodness knows how deep they were. Over this type of road the low gear had to be used for the first time, except for starting, and very slowly we dodged the pools of water by going round them, finally reaching dry land once again without a single dismount. Had the machine been one of the sporting single-gear type it would have involved at least several sudden dismounts in water, probably ankle deep.

Beyond Staines more interesting country was reached, and we proceeded through Harefield and Rickmansworth, where there were several hills to be climbed. Not once was a change of gear necessary, and every ascent was taken at a remarkably good speed. Finally, we finished the journey in the rain, after a long and, what on an ordinary unsprung motor bicycle would have been, a tiring run.

Our general impression of the springing of the machine, the portion we were out to test, was distinctly good.

Members of the Nottingham and District M.C.C. at the Peacock Hotel, Belvoir, on the occasion of their recent opening run.

Manchester M.C.

The official results of this club's recent speed-judging competition are as follows:

Locke (car)	Error 34s.
Lowe (Humberette)	38s.
Watson (Sunbeam)	123s.

Middlesex M.C.C.

The hon. sec. of the Middlesex M.C.C., Mr. S. A. McCarthy, Essex Lodge, 2, Nightingale Road, Lower Clapton, London, informs us that he has just returned to England after 2½ years' service in the West Indies, but is not yet demobilised. As soon as he is free he hopes to be able to revive the club.

Rochester, Chatham, and District M.C.

This new club is now well started, and the following officers have been elected: President, Mr. E. P. Leonard; vice-president, Mr. A. W. Booth; captain, Surgeon-Lt. T. P. Cooper; sub-captains, Messrs. C. J. Stockwell and G. Gill; hon. treasurer, Mr. O. J. Roots; and hon. secretary, Surgeon-Lt. S. White, 3, South Avenue, Rochester. The secretary will be pleased to hear from secretaries of clubs in Kent and Surrey with a view to arranging inter-club meets and competitions.

Sutton Coldfield and Mid-Warwickshire A.C.

The Sutton Coldfield and Mid-Warwickshire A.C. is holding a closed reliability trial on May 17th over a course of approximately fifty-five miles. The trial will include speed-judging; there will be two observed test hills, and an awkward hairpin bend. The competition will be run on extremely novel lines, and full particulars will be announced at an early date. The competition will be for motor cycles with and without sidecars only, as the course is not suitable for cars.

The entry fee will be 5s., and entries close by first post on May 13th.

Birmingham M.C.C.

The official results of the Birmingham M.C.C. speed-judging competition are announced as follows:

WINNING MEMBERS.

1. {B. Kershaw } Tied with an error of 7s.
2. {E. Kibble }
3. C. L. Whatley Error of 18s.
4. G. R. Morgan " 30s.

WINNING NON-MEMBERS.

1. — Kuhn Error of 2s.
2. G. A. Dalby " 20s.
3. — Horricks " 22s.
4. N. Stokes " 42s.

The next members' competition is fixed for May 17th and 18th to Llangollen and back. The conditions for this are such as will enable any machine from 2½ h.p. to 5 h.p. to compete on equal terms.

Future Events.

April 26.—Public Schools M.C.C. Hill-climb.

April 26. — Ystalyfera and Swansea Valley M.C.C. Hill-climb.

April 26.—N.M.C.F.U., Leeds. Run to Dick Hudson's.

April 27.—Burnley M.C.C. Run to Ingleton.

April 27.—N.M.C.F.U., Leeds. Run to The Dukeries.

April 27.—Nottingham and District M.C.C. Run to Matlock.

April 28.—Edinburgh and District M.C. Open Reliability Trial.

May 3.—Birmingham M.C.C. Social Run to Warwick.

May 3.—York and District M.C. Social Run.

May 4.—Bolton and District M.C. Reliability Trial.

May 4.—N.M.C.F.U., Sheffield. Reliability Run to Knutsford.

May 7.—York and District M.C. Slow Hill-climb, Garrowby.

May 10.—Exeter and District M.C.C. Opening Run.

May 10.—The M.C.C. Speed-judging Competition.

May 17-18.—Birmingham M.C.C. Week-end Touring Competition to Llangollen.

May 17.—Sutton Coldfield A.C. Half-day Trial.

May 17.—Woolwich, Plumstead, and District M.C.C. Open Trial for Matchless Cup.

May 21.—York and District M.C. Reliability Trial.

May 24.—Birmingham M.C.C. Social Touring Trial. Week-end to Llangollen.

June 6.—M.C.C. London - Edinburgh Run.

June 7-9.—Birmingham M.C.C. Trial to Land's End.

August.—A.C.U. Six Days Reliability Trials.

West Cumberland M.C.C.

Motor cyclists in the Workington district should communicate with Mr. F. Harrison, Moss Ghyll, Lamplugh, Cockermouth, who intends organising a new club in West Cumberland.

Woolwich, Plumstead, and District M.C.

The results of the fifty-mile non-stop trial of the above club are now issued, and are as follows: 1, T. J. Ross (4 h.p. Triumph sc.); 2, W. Jee (8 h.p. Matchless sc.); 3, F. J. Ellis (6 h.p. Matchless sc.).

Another trial to Hastings and back will take place on May 18th. The competitors will run in teams. Hon. sec., Mr. F. J. Ellis, 3, Nightingale Place, Woolwich, S.E.18.

Burnley Motor Gipsy Club.

The membership of this club increases every week. The opening run was to Blackpool on Friday last. Hon. sec., Mr. A. Leather, 90, Accrington Road, Burnley.

Carlisle (Chelsea) C. and M.C.

The dance at the Chelsea Town Hall, to inaugurate the reopening of the Carlisle Cycle and Motor Club, was a great success. The proceeds are to be devoted to the club's prize fund.

Wombwell and District M.C.C.

Although only formed a month ago, the membership of this club now exceeds thirty members. Two cups have been offered for competition. Motor cyclists in the district should communicate with the hon. sec., Mr. E. Charlesworth, Central Garage, Wombwell.

Exeter and District M.C.C.

The Exeter Club, which before the war covered a large part of Devonshire, has been resuscitated with a membership of over a hundred. A light car section has now been added for owners of three and four-wheeled vehicles of not more than 1,100 c.c. Mr. E. J. Hancock is again hon. secretary, with Mr. F. Tapley-Soper as hon. treasurer.

Motor Cycling Club.

The M.C.C. speed-judging competition will take place on Saturday, May 10th. Competitors will assemble at Hadley High Stone at 2.30 p.m. Speedometers and watches will be allowed. Competitors will have to ride twice over a course of about five miles at a set speed, and on a third round they will be allowed to nominate their own speed up to twenty miles an hour.

Liverpool M.C.

The opening run was a great success and a good augury of the future of the club. Two prizes were given for an "appearance" competition, the judging being undertaken by a trio of ladies selected from those present. This resulted in a win for Mr. C. R. West, whose mount was an A.J.S. and sidecar; and in the solo class Mr. E. H. Garwood, riding a 2½ h.p. Royal Enfield, was awarded the second prize.

The secretary, Mr. Norman Dean, has arranged for a lecture on "Benzole and its Properties," to be given by Mr. S. Henshaw, Staffs. Chemical Co. The date, which is not yet fixed, will be about the beginning of May. An open reliability trial to be run on benzole has been arranged for Whit-Monday. The hon. trials sec. is Mr. Lionel V. Barton, Shaftesbury Hotel, Liverpool.

A 50 lb. MOTOR CYCLE.

A Trial of the Latest Zephyr Auxiliary Motor.

The light weight of the Zephyr motorised bicycle will make particular appeal to ladies.

ON several occasions we have referred to the Zephyr auxiliary motor attachment for pedal cycles, which has been evolved by the London and Westminster Industrial Syndicate, 8, Victoria Street, Westminster, London, S.W.1. This interesting and ingenious little power unit has now reached the stage which will enable it to be manufactured in quantities. In the case of the final model the motive power is a two-stroke engine of about $1\frac{1}{2}$ h.p. (53 mm. \times 53 mm.) attached to a horizontal tube, the forward end of which is fixed to the seat-pillar, while the rearward end is made adjustable on the threaded extension of a pair of supplementary back forks secured on the rear wheel spindle of the bicycle. There are two sprockets between the flywheel and the crank case—one for the drive to the C.A.V. magneto, the other for a chain-driven friction pulley, which forms a part of the chief feature of the Zephyr attachment.

Hill-climbing Power.

The pulley and its sprocket are mounted in an adjustable bearing at the lower end of a swinging arm controlled by a Bowden wire from a lever on the handle-bar. An ingenious compression release on the engine is worked by an inverted lever under the left handle-bar grip, and the right-hand lever controls the front rim brake. The rear brake of the machine we tried was of the back-peddalling variety.

To start the machine the pulley control lever is raised, causing the pulley to stand clear of the belt rim on the rear wheel of the bicycle. The compression is released, the pulley control lever depressed, and the machine pedalled. On releasing the pulley and compression levers the engine fires, and the fibre-covered pulley transmits the power to the belt rim. The direction of rotation and method of mounting the pulley cause it to take an ever-increasing grip on the belt rim.

At the invitation of the makers, we journeyed to Brighton one day last week in order to try the attachment, and the long hill chosen for this purpose had a gradient of about 1 in 14.

Mr. Albert Lambourn, of the Old Mill Works, where the Zephyr is made, first climbed the hill at a good twenty miles per hour, which was quite a creditable performance; but our first attempt to emulate this failed through not maintaining the high revolutions necessary for so small an engine to give its full power. We had that morning been riding an 8 h.p. outfit, which explains our error. However, on a second attempt the Zephyr carried us up the hill in excellent style.

Re-starting on the Hill.

Probably the experienced motor cyclist is not exactly the person to try an attachment of this kind, as, unconsciously, he expects the same results as are obtained with a motor cycle, and it is only when he realises that past experience for the moment must be forgotten that he can successfully operate such a machine. One attempt to restart on the hill failed, but on a second occasion a successful start was made.

No doubt the Zephyrs will meet all the requirements of those for whom they have been designed, and will do much good missionary work among cyclists, who ultimately will become owners of higher-powered machines. Their sphere, however, is not confined to this section of the com-

The Zephyr is fitted with a stand having a long leg, which is stayed by two straps hooked on to eyelets on the near side wheel stay. When out of position it is strapped to the top tube.

munity, and we anticipate that, in this mechanical age, a large number of people will buy it for its general utilitarian conveniences. Many partially disabled men, who are physically incapable of strenuous pedalling, will also find a motorised bicycle a great assistance.

The weight of a bicycle fitted with a Zephyr attachment is about 50 lb.

The Zephyr attachment embodies a two-stroke engine of 52×52 mm. = 110 c.c. and friction transmission.

PETROL CONTROL.

IT may confidently be anticipated that the super-tax on petrol will be abandoned at an early date. So much may be taken for granted, but what concerns motor cyclists principally at the moment is to ensure that the date shall, in fact, be not unduly delayed.

It is now admitted on all sides that the object for which the Petrol Control Department was instituted has been achieved, and *The Motor Cycle* opines that the new Budget will reveal an end to its office.

The present price of petrol is 3s. 9d. per gallon, and there cannot be any

questioning the statement that this high price is having a deleterious effect on the industry, an effect perhaps not particularly obvious at the moment, but which will be more apparent as time goes on. While on the subject of motor spirit taxation, we must not forget that the original duty of 3d. per gallon on petrol was doubled in 1915. We contend most strongly that there should be an immediate reversion both to the old or a lower scale of duty and to the policy of ear-marking the money accruing from it for road improvement.

THE GREAT MARKET OVERSEAS.

Methods of British and United States Motor Cycle Makers Compared.

By Capt. B. C. WOODWARD, R.A.F., of Germiston, Transvaal.

THE question of British *versus* American productions has been the subject of much correspondence at various times in the columns of this journal, and it is only in the matter of larger wheels and tyres, plus the greater ground clearance, that the American machines have proved superior to the British for Overseas conditions. I had been a rider for many years before I mounted my one and only American machine, which was not of the spring frame variety, and the greater insulation from road shocks which that machine provided over anything previously ridden made riding on South African roads (?) an absolute pleasure. Several important manufacturers, including the Clyno, A.J.S., Matchless, Rover, Royal Ruby, and Rex, are fitting larger wheels and tyres. If road shocks can be eliminated sufficiently by these means to render rough riding comfortable to the rider, the whole machine must benefit to a similar extent, and fewer frame fractures and damaged or broken wheel rims will be found on British machines equipped in this manner.

The South African Market.

Personally I am under the impression that the average British manufacturer was so busy in catering for his growing home market before the war that he thought very little of the supply of the South African market. Certainly the number of machines which that market can absorb is small compared with Great Britain, but a small market of to-day may be a large market to-morrow, and in the three years before the war the machines on the road in South Africa more than doubled in number. The purchasing power of the population is far higher there than here at home, and in 1915 I should estimate the proportion of motor vehicles to population was one to forty persons in the three most thickly populated areas.

I have said that the market is a growing one, but a popular American machine has captured many of the new riders and not a few of the old. The credit for this is not due so much to the machine as to the methods adopted in placing it on the market. I have known a British agency be given to importers of "soft goods," and others given to firms with whom the agencies were simply "side lines." Sometimes a motor cycle before it reaches the South African market passes through several hands, to each of which some profit clings, resulting in the machines ultimately reaching the retailer at a price which compels him to sell at a figure higher than the real value of the machines, or, in order to sell at a competitive price with other machines, he has to reduce the selling price to an amount which does not leave him a fair profit. Then, again, there is the agency held by the firm which simply sits on its appointment in order to prevent some firm in opposition from becoming too keenly competitive.

Capt. B. C. Woodward, R.A.F.

There is another point which promotes the sale of the American machine, and that is the commission granted to sub-agents, which is higher than that received by them on the sale of British machines. The sub-agent is the final link in the chain of service rendered to the rider. He has the task of mothering

the machine during the most critical period of its life when it needs more care and attention than at any period, and when its rider is often least qualified to care for it at all. His work does not finish when the machine leaves his shop, but continues for a month or two after the machine has taken to the road, and in the event of defect in any part, although that part is supplied free, the sub-agent has the expense of fitting the part. He earns all he makes on the sale of an American machine, and more than he receives on the sale of a British.

The question of distribution of profits needs some attention by manufacturers generally.

The demands of the home market will tax the energies of manufacturers for some time, but there are quite a few additions to the manufacturing ranks, and this, with the large production programmes decided upon by many, will eventually compel attention to be directed towards the finding of new markets. The tendency on the part of manufacturers at present is to concentrate on the supply of home demands, presumably at the expense of the Colonies, where British machines are required just as urgently.

American productions during the past four years have not been excluded from South Africa, neither has D.O.R.A. raised her voice in prohibition of pleasure riding and restriction in the business use of motor cycles, and should the home market receive first and sole attention, further opportunity will be given American manufacturers so to strengthen their hold on the market that it will take years to establish the British motor cycle on even its pre-war footing in South Africa.

A Golden Opportunity.

British manufacturers are now making a new start in production, some with entirely new designs, others with their pre-war models embodying new features resulting from experience gained during the war. Why not redesign also the methods adopted by many in handling Colonial trade. Bring your factories, factory knowledge, and spares supplies more closely in touch with your distant riders, and give them a "service" in every way equal, or superior, to that enjoyed by riders at home. The ways and means are not hard to find, and the result, even if not great in immediate increase of business, can be obtained without expense and at no great trouble. By more up-to-date and keener business methods British goods will be placed in their correct position on British colonial markets, and the methods adopted for the supply of one market should prove equally successful on all.

CURRENT CHAT

Times to Light Lamps.

SUMMER TIME.

April 24th	...	8.37 p.m.
" 26th	...	8.41 "
" 28th	...	8.44 "
" 30th	...	8.48 "

Police Trap.

We understand a police trap is working every Sunday from midday till 7 p.m. between Sunbury Cross and Staines.

The Price of Motor Spirit.

The A.A. has called a meeting of all interested motorists at the Star Hotel, Maidstone, for to-day (Thursday, the 24th) at 3 p.m. to discuss "the price of motor spirit." Mr. P. Frost Smith will be in the chair.

Eastertide Events.

This Eastertide several important events took place in the motor cycling world. In ordinary circumstances, *The Motor Cycle* would have commented upon and illustrated the events in this issue; but in this instance we have refrained, out of consideration for our works staff. Few realise the task of printing a journal with a huge circulation such as *The Motor Cycle* enjoys. Incidentally, it has set up a world's record in automobile journalism. This issue actually borders upon the 100,000 mark. To have included illustrated descriptions of Easter events in this issue would have necessitated the curtailment of a long-anticipated holiday badly needed by all the sections of our works.

1919 Peugeot Motor Cycles.

Despite the fact that we have heard rumours that the 1919 Peugeot range would include a four-cylinder, the Peugeot firm has decided to remain faithful to the twin-cylinder 45° type for the present year. The machines, however, have been improved by the fitting of a countershaft gear box, the changes being effected by a lever placed on the right-hand side of the frame.

The two twin-cylinder types will be the 3½ h.p. and the 6 h.p., the former having cylinders 56 mm. x 70 mm., two-speed gear, and 650 mm. x 50 mm. tyres. The price will be approximately £87. The 6 h.p. pattern will have cylinders 70 mm. x 96 mm., three-speed gear box (which is curious, as the third speed is obviously needed much more on the lower-powered machine); price approximately £96.

The sidecars will be sold made in wicker, sheet metal, and wood, the latter following the general form of the floats of a seaplane.

Motor Cyclists in Airmen's Garb.

The leather Flying Corps coats are very popular with motor cyclists this year.

Turbines.

A Johannesburg man has invented an internal combustion turbine, but then so have men in nearly every town in Great and Greater Britain.

Standardised Chains.

Three of the most important chain manufacturers—i.e., Hans Renold, Ltd., Brampton Bros., and Coventry Chain Co.—have agreed to standardise chain sizes, a policy which tends to increase outputs and facilitate renewals. The sizes of interest to motor cyclists are as follows:

	Pitch.	Inside Widths!
Magneto chain	.375 (1½ in.)	.125 (1 in.)
Motor cycle chain	.5 (1 in.)	.25 (¾ in.)
Ditto	.5 (1 in.)	.19 (¾ in.)
Ditto	.625 (1½ in.)	.25 (1 in.)
Ditto	.625 (1½ in.)	.375 (1½ in.)
Ditto	.75 (1½ in.)	.32 (1¼ in.)
Ditto	.75 (1½ in.)	.44 (1½ in.)
Cycle car chain	1 in.	.67 (1½ in.)

The Cycle and Motor Trades Benevolent Fund.

We are in receipt of the "Handbook of the Cycle and Motor Cycle Trades Benevolent Fund," which contains the annual report of the general hon. secretary, Mr. A. J. Wilson, showing the state of the affairs of the fund to be most excellent. There has been a gain of 1,566 members during the year, and the financial position of the fund has been improved to the extent of £2,715 12s. 6d. In the report, it is pointed out that over 1,000 members and subscribers have been serving in H.M. forces, and their return to civilian life has naturally entailed heavy calls on the fund. Assistance is also required by members who had their own businesses and intend to start again.

Special Features.

ROAD TESTS OF NEW MODELS.

OVERSEAS SECTION.

THE GREAT MARKET OVERSEAS.

On the Road.

Every week-end sees more machines on the road—and many of these new models.

Motor Cycle Police.

A Middlesex reader, who has been trapped by plain-clothes policemen who were using a sidecar outfit, is very sore that "motor cyclists should trap each other," and suggests that they deserve to be given the cold shoulder by other motor cyclists. We scarcely like to give the number of the machine in case it was a borrowed one. This appears to be a new departure on the part of the English police, but we would point out that in America almost every city has its squad of police mounted on motor cycles. Maybe, when the police taste of the joys of motor cycling, they will not be so anti-motorish.

How the French are disposing of their Surplus Motor Vehicles.

In a leader in this week's issue, we suggest that the Government should hold sales of Army motor cycles in the provinces. The French Government has already decided to sell its surplus Army vehicles in twenty-five different centres. We hope a similar decision will be reached in this country. Successful sales of Army horses and mules have already taken place in scattered provincial centres, and it is fairly certain that auction sales of motor cycles would be equally successful if arranged to be held in different parts of the country.

The Leeds N.M.C.F.U. lined up for the start of their run to Boroughbridge and Thirsk.

Which Type?

Specifications from Overseas still continue to arrive, and we hope shortly to summarise them.

The Parisian Taxi Sidecars.

We understand that 200 of the taxi-sidecars to be put on the streets of Paris will be running in June. The drivers will be in uniform, and will, we are informed, be clean, polite, and correct in their behaviour. It is also rumoured that there will be no tips.

**The London-Edinburgh Run.**

We are able to announce still further particulars with regard to the London-Edinburgh run. It has now been decided that competitors who, as we have announced before, will enter for the single journey only, will be allowed to be a quarter of an hour early or half an hour late at all controls, except the final one at Liberton, where they must arrive to schedule. Competitors, however, will have to hand in their number cards at the official hotel in Edinburgh. The run starts at 9 p.m. on June 6th, and it is interesting to note that the moon will be one day older than the first quarter on that night. The awards will be gold, silver, and bronze medals, if possible.

The M.C.C. of South Australia.

On January 27th, at Sellicks Beach, the M.C.C. of South Australia completed its record runs, held over from the December meeting, with the following results, all electrically timed, with flying starts:

MILE PASSENGER, OVER 600 c.c.

- E. Ferguson (8 Indian and sc.) ... 45½s. (79.29 m.p.h.)
E. A. Cutting (Indian and sc.) ... 57½s. (62.5 m.p.h.)

HALF-MILE PASSENGER, OVER 600 c.c.

- E. Ferguson (8 Indian and sc.) ... 22½s. (80.35 m.p.h.)
E. A. Cutting (Indian and sc.) ... 30s. (60 m.p.h.)

HALF-MILE SOLO, 301-350 c.c.

- A. McKee (Kent) ... 35s. (51.42 m.p.h.)
OVER 600 c.c.
E. Ferguson (8 Indian) 20½s. (86.54 m.p.h.)
L. Tapp (Indian) ... 24½s. (74.4 m.p.h.)

(Top) The Public Schools M.C.C. opening run. Members' motor cycles outside the Hut Hotel, Wisley.

(Bottom) Lt. H. B. Browning, R.G.A., hon. sec. of the club, astride his overhead valve Bat-Jap.

Sidecar Manufacturers in South Africa.

A firm in Johannesburg is seriously entering the sidecar industry, producing chassis and bodies; and over 1,000 vehicles already have been turned out of the factory. It is said that over £13 is saved in freightage alone upon each sidecar produced and sold in South Africa.

Motor Cycle Clubs in South Africa.

Motor club life has been very brisk in S. Africa, and many motor cycle clubs in Natal have drawn up fixture lists. The Natal M.C.C. has taken all its old-time trophies out of safe deposit in preparation for new competitions. The Durban and Maritzburg, E. London, Cape Peninsula, and Rand clubs are also busy. This enthusiasm will undoubtedly be reflected in an increasing demand for machines.

Motor Cycles for N.W. Mounted Police.

The Canadian Government recently held a severe trial of American motor cycles eligible for service with the N.W. Mounted Police, which is being reorganised. A considerable number of motor cycles are to be used in future in connection with tourist traffic, border smuggling, the chasing of outlaws, etc.

A New Motor Cycling Review in France.

We learn that a new sporting paper is to appear under the title of *Motorcyclisme*. The paper will deal solely with motor cycling in France, and will be managed by Mr. Sweetts, who is well known in the motor cycling world. The paper will appear regularly every fortnight, starting at the end of the month. The offices are 1, Cité Paradis, Paris.

Home-produced Fuel.

The Liverpool M.C.C. Whit-Monday Trial will be run entirely on benzole—a good example for other clubs to follow.

Magnetised Sprockets.

The leakage of magnetism into the steel sprocket of a certain American magneto is not confined to machines in this country. A reader of *The Motor Cycle* has had the same trouble in America.

The Scooter.

In August of last year we asked in these columns what had become of the motor scooter. In a period of less than twelve months half England is talking about it.

Safety First.

In America the road associations make great use of the phrase "safety first," and at one corner, we are informed, there is a notice "Safety First—Dangerous Corner—Slow Down to Fifty."

Benzole in the Transvaal.

It is said that nearly 5,000 square miles of coal deposits are in the Transvaal. The extractable tonnage is conservatively estimated at about 56,000 millions. Converted into benzole, with existing means of distillation, this would produce approximately 140,000 million gallons of motor fuel.

A Suggestion.

Why is it that when very unusual fittings are adopted on motor cycles, the makers fail to place adjacent to the article a word or letters indicating that it operates the reverse way to the usual method? For instance, suppose an oil tap is closed by turning it anti-clockwise, and opened by turning it clockwise, which is contrary to the usual method, would it not be an easy matter to indicate the direction of movement by an arrow and the word "Open"? It is done in a few isolated cases, but is more generally omitted.

AUTO CYCLE UNION NOTES.

(Officially communicated.)

THE ARBUTHNOT TROPHY.—The Auto Cycle Union is pleased to report that considerable interest in the Arbuthnot trophy competition is being shown by naval motor cyclists, and there is every promise of the event proving a well contested one. It will probably be held during the early part of July. The late Rear-Admiral Sir R. K. Arbuthnot was a prominent motor cycle competition rider, and sacrificed his life in the Battle of Jutland, the last venture of the German fleet.

A WAR MEMORIAL.—At the suggestion of Col. F. Lindsay Lloyd, the General Committee of the Auto Cycle Union will consider the advisability of suitably commemorating the great war services rendered to the country by motor cyclists, both Overseas and at home.

A.C.U. TRAVELLING EXPENSES.—It is proposed that the third-class fares of members of the General Committee of the Auto Cycle Union resident more than seventy-five miles from the place of meet-

ing of the General Committee shall, on demand, be repaid to them out of the funds of the Union.

BADGES FOR MOTOR CYCLISTS.—As fast as supplies are forthcoming from the manufacturers, the Auto Cycle Union is issuing badges to members applying for them for attachment to their machines. Those desirous of receiving the A.C.U. badge may rest assured that any delay is occasioned only by the difficulty of obtaining deliveries from the makers.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address

WHAT SHALL WE WEAR?

Sir,—The fact that "K.S." is unable to keep rain from running down her neck is no evidence that all others are similarly incapable. One does not hear men complaining about water running down their necks, and I see no reason why women should not be as sensible as men about their neckwear.

When I wrote my last letter I left details to the intelligence of your readers. I thought it unnecessary to say clothes with V necks were unsuitable in the rain.

PHYLLIS VERNON.

TANDEM MOTOR CYCLES.

Sir,—May I be permitted through your paper to make a plea for the tandem motor cycle. I have for the past ten years been trying to secure a motor cycle with seat front and rear, the rear seat to be suitable for a lady. I need hardly enumerate the advantages of this machine, as those who use the motor cycle other than solo will readily realise the benefits of a cycle built on these lines for touring purposes. Is there no maker who is willing to turn out a tandem motor cycle? If there should be a firm willing to place on the market a machine with a future, namely, a tandem motor cycle, I trust to hear from such, either direct or through your pages.

NORMAN GREEN.

[There were several tandem motor cycles on the road fifteen years ago, and they died a natural death.—Ed.]

ANOTHER NEW MODEL.

Sir,—Having been a reader of your most valuable journal for many years, I trust you will pardon me by giving you a rough idea of the motor cycle (combination) which I intend to manufacture on my release from the army, with which I hope to open the eyes of the motor world. It is my own invention and works most satisfactorily. The engine is a flat twin of 6 h.p., of the two-stroke principle, but I shall term it a one-stroke. The cylinders are of aluminium, fitted with steel liners and detachable heads, air-cooled. My intention is to use only one piston, no crankshaft, and no connecting rods. There is only one short shaft in the complete unit, mounted on two large ball bearings which carry the flywheel; and my patent gear, which gives four speeds and contains clutch and engine starter, the magneto being coupled direct to this shaft. From this shaft the power is transmitted to the back wheel by an enclosed silent chain. The unit is perfectly silent and vibrationless, as there are no gear cut wheels in the unit whatever. The machine will have a very smart and pleasing appearance, and complete with C.B. sidecar it is to sell at the very low figure of £45.

B.E.F.

A SUGGESTED CYCLE CAR.

Sir,—I was pleased to read that someone has taken sufficient interest in my suggestion for a cycle car to be built on the lines of the Fordson tractor to write to you on the subject. By the way, my idea is more on the lines of the old 8 h.p. Rover single-cylinder car, designed, I believe, by Mr. Lewis. I mentioned his name in my article, but the omnipotent blue pencil has been at work, with the result that the name does not appear. I should also like to disclaim any liability for the wording of the heading, although the idea is, of course, "borrowed." It is unfortunate we cannot all be original, but as originality appears to suffer when brought in contact with commercialism it does not always pay to be too original.

I know the suggestion is opposed to what is considered ideal car practice. It is obvious that the unsprung weight would be subjected to excessive vibration, and this I knew at the time the suggestion was made.

The front springing would partially insulate the engine and gear box from vibration, and, after all, I think most rear axles are unsprung weight. The front springing is borrowed from the Ader—a French car—not from the Ford or the Fordson. The Ader car was produced first about 1888.

I am obliged to Wm. A. Davis, A.M.I.M.E., for his kind advice, but I cannot understand his remark that "one might just as well start designing a traction engine on the lines of the Levis." What has that to do with the suggestion? If every traction engine was as simple as the Levis engine and balanced on a single pair of wheels I could understand him better. Was not the *Mauretania* designed on the lines of smaller vessels that preceded it? If not, what lines did the designer follow?

Will Mr. Davis let us see his idea of a totally enclosed transmission from front to rear by "putting a case round it" (not an enclosed propeller-shaft only) without increasing unsprung weight. The suggestion was not merely to close in the shaft, but to provide for lubrication of all the transmission from one point, viz., the crank case sump of the engine.

MECHANICUS.

AN OLD CHALLENGE.

Sir,—One remembers that some time ago a controversy between Messrs. De Lissa and Bradshaw took place, in which the latter challenged any maker of motor cycle engines to put up one for a bench test. I think Mr. De Lissa agreed to do so when he was able to import a suitable engine. Could this now be done? It would be interesting, as Mr. Bradshaw has apparently revised his opinion of overhead valves.

Re agent's methods: I wrote a firm for a 4 h.p. Douglas tappet complete, asked them to post it to an address as soon as possible after receiving the cost from me. No reply. After several days I proceeded on leave and called on this firm, and learnt that "they did not have one, or they would have replied to my letter," and "if we have not the article we do not reply—unless you enclose a stamp."

HURDCOTT.

IN DEFENCE OF THE HUB GEAR AND BELT DRIVE.

Sir,—Your correspondent "M.R.C." has much interested me in his remarks on hub gears. I have at present a big $4\frac{1}{2}$ h.p. Quadrant with a large and heavy sidecar fitted with a hub gear, and also at various times have had other machines so fitted, and have never had any trouble with them.

The thing overlooked by the average rider is the necessary and simple adjustment of the gears at frequent intervals and the daily oiling with thin cycle oil. This last is most important. For comfortable sidecar work hub gears are unrivalled, as with a small engine pulley one can get quite a comfortable speed on top gear, and the average $3\frac{1}{2}$ h.p. machine will then carry three, if necessary, anywhere on main roads. The reason for the decline in popularity of hub gears with their sweet drive, in my opinion, is the difficulty of repairs or adjustments of any kind. I quite agree with "M.R.C." that if made larger and more substantial, and also more easily repairable should occasion arise, hub gears would again regain much of their lost popularity.

E. KIMBER.

A TABLOID HISTORY OF AIR-COOLING.

Sir,—I must apologise for the slip in my letter of April 3rd. The Salmson (Canton-Unné) engine was wrongly included in the examples of rotaries. Of course, as "Road Rider" points out, it is a radial, the M7 model (90 h.p.) having, I think, seven water-cooled cylinders, and the 190 h.p. "horizontal" model fourteen.

"Road Rider's" figure of 10% as the loss of b.h.p. due to circumferential wind resistance is probably correct, but, as I said in the letter referred to, the "flywheel effect" of the rotating cylinders, which is augmented by the low compression, does help things considerably.

All the same, as "Road Rider" and I agree, the rotary is more than supplanted by the radial, which has so many of its advantages with so few of its defects. REVS.

THE BEST IN THE WORLD.

Sir,—With reference to the article "Evolving a Motor Cycle from First Principles," by Major Waterlow in *The Motor Cycle* for the 10th inst., I must correct him on one point. He says in his article: "I should . . . by reminding my readers that motor cycle manufacture is the only branch of the motor industry in which we British really lead the world." I must ask Major Waterlow if he can name any aero engines of any country, enemy included, that can hold a candle to the following: Rotary—B.R.2; Stationary air-cooled—A.B.C., Wasp, and Dragonfly; Water-cooled—Rolls-Royce, Falcon, and Eagle?

Major Waterlow may have been in "Mesopotamia" for some time and is now out of touch with aerial motor developments, but I cannot allow such a sweeping statement to go unchallenged, as it is admitted our aero engines are "the best in the world." SPARKPLUG.

Burton-on-Trent.

AVERAGE SPEEDS.

Sir,—Regarding the letter on average speed in *The Motor Cycle* for April 10th, your correspondent "R.N." evidently believes with the cynic that "all men are liars." That being so, I feel that I may venture to make a few remarks about average speeds without danger of incurring any more blasting reproof than being dubbed by your correspondent as one of the common herd, which worries me not at all. As "R.N." lives at Slough it is probable that he knows the road from London to Bournemouth. About a

year ago I rode from Bournemouth to Egham, *via* Christchurch, Lyndhurst, Redbridge, Totton, Winchester, Itchen Abbas, Alton, Alresford, Farnborough, Bagshot, and Sunningdale. The distance is about ninety-eight miles, and my running time was 2h. 50m. exactly. This works out at 34 m.p.h. and a bit over.

I stopped for lunch at Winchester, and a short stop at Farnham for some light refreshments. On both these occasions I was careful to note the exact time and duration of each stop on paper.

The run was made on a 1916 3½ h.p. Rover, the Tourist Trophy model, with a Philipson pulley. The engine ran perfectly throughout, kept perfectly cool, and there was an entire absence of any signs of "racing" at speed.

I am unaware what make of machine "R.N." rides, but I feel quite sure that, given a machine such as my Rover or a Norton B.R.S. model, he would soon modify his opinion as to the impossibility of averages of above 30 m.p.h. for long distances. Usual disclaimer.

Egham.

HOW TO SELL A MOTOR CYCLE.

Sir,—I am writing to congratulate you on the excellence, as an advertising medium, of your paper *The Motor Cycle*.

Last week I sent you a notice to the effect that I was selling a 6 h.p. A.J.S. combination (1915). It was a bare, unpretentious notice, but by 11 a.m. on the day of issue I had disposed of the machine. The purchaser had made a journey of fifty miles and brought the money with him. He had to repair a tube and interchange a pair of wheels preparatory to riding off, and before he was clear away three other applicants put in an appearance and were disappointed.

In the course of the day a dozen telegraphic offers arrived, most of the senders having prepaid a reply.

Next morning a dozen letters arrived from the "canny" Scot, and in the course of the day the wires were again heated by urgent but belated messages. One of the senders forwarded a considerable deposit, but stated neither name nor address. If I do not discover him soon I shall have to ask for your assistance in order that I may preserve my reputation for honesty.

May I add, sir, that I am amazed at the credulity of the public. My machine might have been a "dud," yet I could have sold it twenty times over. I had no time to do any cleaning, and the "bus" was looking its very worst.

D. H. M. CURTAIN.

The suggested new stone bridge over the L.B. and S.C. Railway at Belmont, Surrey, proposed as a memorial to those fallen in the war. At the present time many town councils are undecided as to the manner in which the

great sacrifices made during the war shall be commemorated, and such schemes which beautify the highways and serve so many people are truly better than ordinary monuments. It is proposed that the bridge depicted above shall bear the names of the glorious dead.

IMPROVING THE SIDECAR OUTFIT.

Sir,—We notice in your issue of March 27th, page 304, an article by Maj. P. H. Lewis, R.E., in which the saddle type tank is recommended. We would like to point out that this type of tank is our registered design, No. 666269, and is now fitted in all cases to our Allon motor cycles.

We also observe, on page 296, particulars of a patent specification by E. A. Radnall for a cradle method of mounting the engine, etc., of a motor cycle. We would point out that we have used the cradle method of assembling on the Allon motor cycle for more than five years, and we cannot, therefore, see that Mr. Radnall can claim any novelty.

ALLDAYS AND O'NEILS PNEUMATIC
ENGINEERING CO., LTD.

ADVANTAGES OF A TWO-STROKE.

Sir,—I am afraid Mr. Varney is talking a little "tall" when he says his 2½ h.p. Levis will average 35 m.p.h. with a sidecar and 45 m.p.h. solo. To average these speeds the machine would have to travel considerably faster, and nothing will convince me, except an actual test, that the 2½ h.p. standard Levis is capable of the above. I am pleased to say I am the owner of a 1916 standard 2½ h.p. long-stroke T.T. three-speed A.J.S., fitted with a Binks three-jet carburettor (with no dead spot), and if Mr. Varney lived nearer here I would be very pleased to give him a run out to see him average his 45 m.p.h. solo on the Levis. My A.J.S. has covered half a mile on the main road at 53 m.p.h. (not per speedometer reading), geared 5½ to 1, and to average 45 m.p.h. I would have to drive practically "all out" the whole time, which is impossible on the open road. My best average was from Birkenhead to Oswestry in the summer of 1917, and worked out at 29½ m.p.h. over a distance of about forty-six miles, and to do this I had to "go some." I have had sprints with all kinds of two-strokes, and the most that could be got out of the best of them was very little over 40 m.p.h. (excepting, of course, the Scott). If Mr. Varney's Levis will beat the 2½ h.p. Douglas (top speed between 40-45 m.p.h.), then he has got "some bus." My A.J.S. can do anything from 2 m.p.h. up to nearly 60, and on one trip from Birkenhead to Oswestry and back my petrol consumption worked out at exactly 184 m.p.g. at an average speed of 22½ m.p.h. I think I am perfectly safe in saying that there is no two-stroke at the present time running to equal this. Usual disclaimer, please. L. STUART.

THE NEW A.B.C.

Sir,—I was very much interested with the new A.B.C. motor cycle illustrated in *The Motor Cycle* for March 13th. One thing in particular the inventor has solved is the rear springing, which, to my way of thinking, is ideal. I should

Diagram illustrating the letter from "AD 3744."

like to know though what will happen after a thousand miles or so to the springs, bolts, or carrier stays owing to the chain stays being much longer than the springs. If a circle is drawn, using the bolt of the stays for a centre, and another circle using the point of the springs where the "give" takes place (my enclosed sketch is self-explanatory) as a centre, it will be noticed the paths of the two circles are not parallel to each other, so, as something has to go, I am keen to know what. The spring would have to bend like a bow, or the joint give where the carrier is bolted to the chain stays.

This is curiosity, not criticism, because I can appreciate a good thing when I see it. AD 3744.

Carliff.

LOSING ONE'S PROP.

Sir,—Having read with interest the correspondence on this subject, I must reply to "Torque's" letter in *The Motor Cycle* of April 3rd.

He says that the 345 h.p. Eagle engine is fitted to heavy machines which are unsafe to dive. Quite so, but I would point out that a number of D.H.4 machines were fitted with these engines, and their speed on the level is over 115 m.p.h., so I cannot see what "Torque" means by diving at 100 m.p.h. One of these machines has been dived "off the map" (over 160 m.p.h.), the map being the pitot reading, but this failed to start the prop., although the engine was O.K. Can "Torque" start a Siddeley Puma engine by diving? I think not. SPARKPLUG.

Barton-on-Trent.

Sir,—In *The Motor Cycle* of March 20th, I notice that one of your readers, who signs himself as "Revs.," states that he cannot see how the "friction of the air on the propeller" could restart a stationary engine. May I point out to "Revs." that I know at least one type of stationary engine that can be restarted by this method.

The engine in question is the D.H.9, which, as you know, has a rather high compression, but, nevertheless, it can always be started by getting "the nose well down," provided that it is in a condition to be started. It is owing to the fact that a D.H.9 could be started in this way that I am where I am now: it meant all the difference to my becoming at least a prisoner of war.

B.E.F.

S.G.W.

OBTURATOR RINGS.

Sir,—In your issue of March 27th we notice a review of a patent for an obturator type piston ring; and, while it is true that the designers of air-cooled aero engines have succeeded in preventing some of the distortion, even so the problem does not appear to be satisfactorily solved.

The considerable development of obturators made during the war has not been published, but it might interest your readers to know that, far from an obturator giving trouble on aero engines during the past few years, there has been absolutely no trouble whatever with such as are manufactured by this company—in fact, it is recognised that no additional overhauling of the Gnome engine is due to their use.

As a proof of this, we might cite the fact that an actual flying life of 250 hours has been recorded, when they were by no means worn out, and that the same obturators can be used again and again in different engines.

The trouble referred to dates back to the beginning of the war, and has long since been overcome. Astonishing as it may seem, the great advantage of obturators lies in the reduction of friction, so that there appears every prospect that they will have a great future.

To any engineer it is evident that a piston ring is a very inefficient packing device, and gases actually get behind it, and, becoming imprisoned, cause additional friction.

We would also refer to the statement that the left-hand drawing shows the conventional Gnome type of obturators, whereas these are applied at the top of the piston, and are thus exposed to the full force of the explosion. In the sketch this is obviously not the case; and, not merely can the pressure on the obturator be reduced, but it is evident that it exists during a portion of the cycle only, and is not imprisoned as with piston rings.

It may interest your readers to know that most promising experiments have also been made with obturators in high-compression engines.

The Post-war SMITH'S Motor Cycle Speedometer

TO Motor Cycle Manufacturers for standardization—to the Motor Cycle Owner for installation on his mount—we are now offering a newly-designed Motor Cycle Speedometer which we claim to be the most perfect, the most reliable, and the most durable instrument ever put on the market. It is a tremendous advance on our pre-war model.

Smith's Motor Cycle Speedometer has been tried and tested under the severest possible conditions—conditions under which no other Speedometer could survive—and every detail in the construction and mechanism of the instrument has been proved to be thoroughly dependable. It is built to withstand the excessive vibration and road shocks to which motor cycles are subjected. It is absolutely steady at all speeds, and makes an accurate record of speed, no matter at what rate the cycle is travelling.

Smith's Motor Cycle Speedometer indicates speed up to 60 miles an hour; the total mileage records 10,000 miles with a decimal figure showing tenths of miles. The trip records up to 100 miles, and also has a decimal figure, so that accurate readings can be taken for long or short distances. As will be seen from the illustration, this new model is of a refined and dignified appearance, whilst the dial gives a perfectly clear reading, both of speed and mileage.

A high standard of excellence, both in design and efficiency, is reached to a remarkable degree in the **Smith's Motor Cycle Speedometer**, and it is sure to meet with the entire approval of all motor cyclists.

RECENT PATENTS.

REVIEWED BY B. H. DAVIES.

THE last few years have converted motor cycle engineers to the use of roller bearings for the big ends of the connecting rods. These bearings were the point at which seizure usually commenced if an engine was either over-

missed by a wide margin. The difficulty tends to become acute when a designer wants to fit roller bearings on a one-piece crankshaft with two or more throws; but is tolerably simple where a built-up crankshaft is concerned, as the parts are then easily threaded into place before the crankshaft is completely assembled.

Triumph Roller Bearing.

The Triumph Co. and G. E. Stanley have patented the highly modern arrangement shown in fig. 1, which is, of course, easily applicable to the gudgeon pin if desired. I call it modern for three main reasons. First, the rollers run directly on the hardened crank pin and inside the hardened big end, no separate races being employed. This method saves weight, reduces the dimensions, and facilitates balance. Secondly, a double row of rollers is adopted, which distributes the pressures, and gives a better line of contact with the races. Thirdly, the rollers are "caged." The perspective sketch of the cylindrical housing is self-explanatory. The annular groove at the centre lightens the housing and distributes the oil; and washers may be used if desired.

Fig. 1.—Triumph Co.'s connecting rod bearing. Pat. No. 122,559. 10/4/18.

loaded or under-lubricated. In nearly twenty years of road experience I cannot recall seizing up a main bearing, a timing gear bearing, or a gudgeon pin bearing, and the seizures which have befallen me occurred in the big end bearing or to the piston, and the former outnumber the latter very considerably. A roller bearing cannot seize, and there is ample space to equip the big end with a race well able to support the maximum load. Given pistons of proper fit and design, engine seizures should henceforth be unknown, even amongst those expert riders who "scrap," and those beginners who sometimes forget to lubricate. Incidentally, since a roller bearing only requires sufficient oil to protect it from rust, and since the oil ration for the bronze bushes formerly used in the big ends determined the oil ration for the entire engine, we shall use less oil, and carbon crusts will accumulate much less rapidly. With bronze big end bushes a $3\frac{1}{2}$ h.p. engine needs a charge of oil every five miles. With roller big end bearings I have repeatedly ridden forty miles on a charge. In other words, the oil ration is now chiefly determined by the needs of the piston and the gudgeon pin, and they normally require far less oil than the old type of big end bush.

There has been a most amusing scurry for patents with regard to the mounting of roller bearing big ends, and a vast amount of ingenuity has been exhibited. I fancy a few of the pioneer inventors are feeling rather sore, and must have had high words with their patent agents, for valid master patents in this sphere might have proved valuable, and were not

explosive mixture. Under Mr. Law's patent a bypass is taken from a suitable point in the transfer pipe, and the delivery port of this bypass is made to surround the petrol nozzle. So, instead of a low air pressure approximately adjacent to the petrol nozzle, Mr. Law provides a high air pressure absolutely concentric with the petrol jet. His bypass stream of air and petrol impinges on to the hot deflector ledge on the piston crown, and the stream, so to speak, bounces back into the stream of pure air emerging from the transfer port.

Forced Lubrication.

Mr. C. G. Pullin (the T.T. winner) has a patent interesting to motor cyclists, though it is chiefly propounded for aero work. If an aluminium piston is used in an aluminium cylinder, splash lubrication is inadequate, and any

Jet in Transfer Passage.

Mr. L. W. Law has patented the special method of vaporising petrol on two-stroke engines illustrated diagrammatically in fig. 2. Pure air is drawn through the inlet port into the crank case as the piston rises. When the piston descends this air is compressed, and when the descending piston uncovers the transfer port the compressed air is squeezed up the transfer pipe and through the transfer port into the combustion chamber. Existing patents cover such an arrangement in conjunction with a petrol nozzle mounted in the head of the transfer pipe, so that the rush of the compressed air past the nozzle draws petrol into the combustion chamber, and so furnishes an

Fig. 3.—Pullin's lubricating device. Pat. No. 109,113

failure of the oil supply results in very rapid seizure and the speedy wrecking of the engine. Mr. Pullin employs pressure-fed lubrication through a hollow crankshaft, connecting rod, and gudgeon pin, to oilways machined in the thick skirt of the aluminium piston, the oil passage being finally formed into a circumferential in the piston crown just below the head. Radial holes allow the oil to escape into an empty groove cut round the outside of the piston.

Fig. 2.—Law's fuel injection. Pat. No. 122,564. 23/4/18.

Recent Patents.—

The grooves and holes by which oil passes up the connecting rod are so shaped and positioned that the oil is supplied to the piston on the up-stroke only. Above the oil delivery groove on the piston is an obturator ring, fitted upside down as an inverted L (i.e., 7). On the down-stroke, this obturator wipes the oil off the cylinder walls, and forces it back through the ducts in the piston, from which it drains back to the crank case through an escape hole, which is open on the down-stroke only. Should the oil pump cease working, the engine is immediately switched off, as a plunger switch in the magneto wiring circuit is opened when the plunger is relieved from the oil pressure. A neat union for connecting a (stationary) oil pipe to a (revolving) crankshaft is included in the design.

A "Changed Over" Contact Breaker.

The James Co. have patented a neat method of transferring the magneto contact breaker to the accessible or off side of sidecar machines. A small spur wheel, fitted outside the crankshaft transmission sprocket, drives a second and larger spur wheel mounted on a stub axle projecting from the crank case; and the magneto is driven by chain off a sprocket secured to the larger spur wheel. The contact breaker will thus come on the off-side of the machine.

A Square Four-cylinder Engine.

I doubt whether M. Poisson-Quinton's engine will ever figure on a motor cycle. It is the first "square" engine I have

Fig. 4.—The James magneto drive. Pat. No. 123,183. 25/2/18.

ever seen. To form an idea of it, place four 2 lb. jam jars upside down on a table, arranging them so that their plan view resembles a four-leaved clover. Put a 1 lb. jam jar centrally on top of each 2 lb. jar. Imagine that each pair of jam jars is a two-stroke cylinder with a lower unit of greater bore than the upper unit, and imagine that a "tandem" piston of two corresponding diameters works in each cylinder. In each case the lower and bigger cylinder is a charging pump supplying mixture to the upper and smaller cylinders of its neighbour. Thus you get a remarkably compact four-cylinder two-stroke engine. The action of the connecting rods on the crankshaft is too complex for description here.

Four-speed 'Gear Box.

Mr. T. L. Williams protects a four-speed gear box with three shafts. The diagram is self-explanatory. The layshaft carries three gears, A, B, and C, of

which A and B are constantly in mesh with two gears M and N on the driving-shaft, and B and C are constantly in mesh with two gears X and Y on the driven-shaft. Dog clutches are used to lock M and N to the driving-shaft, and X and Y to the driven-shaft. The four drives are obtained through M, A, B, X; N, B, X; M, A, C, Y; and N, B, C, Y. The

box is somewhat large and of an awkward shape. On the other hand, it confers great freedom of choice in the gear ratios.

Castor Sidecar Wheel.

Mr. Christiansen, of Copenhagen, protects a castor wheel sidecar, of which the side wheel is sprung by a quarter-elliptic. The diagram is self-explanatory. I owned a castor wheel sidecar some years ago,

Fig. 6.—Christiansen sidecar springing. Pat. No. 122,860. 15/12/17.

of the laminated type for the rear frame. It is neat and light, but does not offer so wide a bearing to safeguard lateral rigidity as some of the two-spring patterns.

A Five-wheeled Morgan.

Mr. Horrocks, of Bolton, has a kindly thought for the man who buys a Morgan for his honeymoon, and finds his wife unwilling three years later to leave the twins at home. It serves equally well for the budding millionaire, who is just at the stage when the pony trap has been scrapped, and a Morgan has built up the business to a point at which profits

Fig. 7.—Rigby's springing device. Pat. No. 123,181. 21/2/18.

just do not run to a car. A light frame fitted with two side wheels is bolted to the rear of a Morgan or similar three-wheeler, suitable bodywork being fitted to convey one's family or merchandise, as circumstances may dictate. The side wheels act as supporting trailers, the original single driving wheel of the Morgan carrying on its duties secretly underneath the centre of the whole caboodle, whilst the vehicle is ostensibly

Fig. 8.—Horrocks's carrying device. Pat. No. 122,923. 13/2/18.

and am under the impression that British designers dropped this pattern because the castor wheel was so tiresome when the outfit was wheeled backwards.

Mr. Rigby, of the Royal Ruby Co., is still busy perfecting his spring frame. As the sketch indicates, he is a firm believer in using a single central spring

camouflaged as a four-wheeler. I have struck four-wheelers with only one driving wheel—but five wheels, only one of which drives! Fie, Mr. Horrocks! Still, it is a compromise such as Mr. and Mrs. Quiverful must sometimes make with poverty.

RE PATENTS GENERALLY.

Apropos patents and patentees, there appears to be considerable energy and money wasted on useless ideas just now. One can almost invariably tell a first patent. It is usually the most obvious way to overcome a difficulty, or too complicated to be worth while. In the former case, the idea nearly always has been tried and scrapped years ago. We do not wish to discourage young inventors; in fact, the reverse is the case, but there is no good purpose served by rushing to the patent agent with an idea before some enquiries have been made to ascertain whether the idea is new or not.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

The Local Taxation Licence.

? I recently sold a B.S.A. and sidecar to a friend. I paid the £1 road tax. Must the person I sold it to pay another £1 licence if it is transferred to his name?—YANTO.

Yes; the local taxation licence is not transferable, therefore the purchaser must take out a local taxation licence to enable him to use a motor cycle.

Sidecar Screen.

? I should be greatly obliged for your opinion of the 4 h.p. countershaft Triumph for sidecar work with hood and screen; as in the past I have as an owner been very well satisfied with this make, but only doubt if it will have sufficient power for my requirements.—E.H.W.

Naturally, in windy weather a hood and screen, if erected, would make a good deal of difference to a 4 h.p. machine, but perhaps a folding screen only, which could be set at a convenient angle, would not interfere with the running of the machine to any appreciable extent. Your machine is not lacking in power.

Overheating.

? I have recently purchased a 2½ h.p. two-stroke Villiers cycle, and am using benzole as a fuel, but I find that after running for about a mile the machine gradually stops. The fuel was coming through to the carburetter all right, and the jet was not blocked. I found, however, that the engine was exceedingly hot, and I removed the plug, which had a burnt appearance, as though it had been incandescent. When trying to start up again I found that the engine was very stiff, and remained so until I had allowed it to cool down. The engine is obtaining plenty of oil. Is it necessary to fit any extra air device for running on benzole, and do you think this state of affairs might be caused through a very dirty engine? Do you think it would improve matters to fit a Lodge aero plug?—C.G.F.

Either there is water in the benzole or you are using too large a jet. We think it is more likely that the former is the cause. Benzole can be used without any alteration being made, but a smaller jet is advisable. Certainly try the plug men-

tioned—this should be quite suitable—and see if the engine requires to be cleaned of carbon deposit.

Old Motor Cycle.

? I have just viewed a light-weight motor cycle—2½ h.p., single geared, Amac, and Bosch magneto, but without accessories. The engine is a De Dion, with overhead inlet automatic valve. If I purchase do you think: (1.) £20 is a too high figure? (2.) That replacements would be very difficult to obtain? (3.) I should have much trouble to sell, if I wanted to? (4.) How can I get the registered number transferred to my name? (5.) What licences must I have (I have my driving licence)? (6.) If I use benzole, do I require a petrol licence as well?—D.R.C.

(1.) Yes; you can get good modern two-strokes for that. (2.) Most certainly they would. (3.) Possibly. (4.) Write for registration transfer to the Carriage Department, Metropolitan Police, New Scotland Yard. (5.) Beside your driving licence you require to pay the £1 annual tax, registration 5s. (6.) No licence is required for benzole.

The Coventry branch of the N.M.C.F.U. in Badby Woods, near Daventry—a picturesque spot which has become very popular with Midland motor cyclists.

Firing Point on Twin.

? Do you know any reason why the front cylinder of a 45° twin-cylinder V twin engine should have the firing point somewhere about 1 in. later than that of the rear cylinder? I have always aimed at having the firing points to coincide. I believe that most V twins have a slightly different valve setting for each cylinder, but I have never met this difference in ignition point. I shall be extremely obliged if you can throw any light on it.—M.G.

We can only imagine that you have an engine of 45° to which has been fitted a magneto made for an engine with cylinders at 50°. Probably if you grind or otherwise alter the magneto contact breaker cams, you will be able to set the firing points to coincide.

Four-stroking.

? I have a 2½ h.p. two-stroke motor cycle with Villiers engine and Senspray carburetter. After ticking away nicely from starting, the machine begins to four-stroke with intermittent periods of correct running. I have a 30 jet, and the timing is correct. The machine is run on the petrol system. What can I do to remedy the four-stroking? Can you also tell me what proportion of oil I should mix with a gallon of benzole, and whether four-stroking is harmful? The machine gets along nicely even when four-stroking.—L.P.

Nearly all two-strokes will four-stroke under certain conditions. The only way to improve the running is to experiment with different combinations of jet and choke tube in the carburetter. You cannot alter the valve setting without filing the ports in the cylinder and piston. Magneto timing should be set well advanced. Clean the engine by removing the carbon deposit. The proportion of oil to petrol is usually one part oil to sixteen parts petrol.

Dismantling an N.S.U. Gear.

? I have bought a second-hand N.S.U. two-speed gear, and, not knowing how it works, I should be glad if you would let me know how to take it down and re-assemble it? What gear ratio does one get from it? If the top gear is 5 to 1 what is the second gear?—G.W.W.

First remove the cross pin. This enables you to unscrew the sleeve nut, which has a right-hand thread. Having unscrewed the nut, the gear is free to be taken off, and this is best accomplished by putting two large screwdrivers—one each side of the pulley flange—between the flange and the crank case, and levering it off in this fashion. Before the gear is taken apart insert a bar, which will act as a dummy engine-shaft. This can then be gripped in a vice, and it prevents the balls from falling out. In assembling the gear the balls are put in a race covered with vaseline, and they are thus held in position. The gear is fastened on to the engine-shaft by the sleeve nut. If the gear tends to stick after releasing this nut it should be tapped off by means of screwdrivers in the manner described. Excessive force must not be used or the flange will break. A sharp tap should

suffice. It should be assembled on a dummy engine spindle in a vice. Release the lock nut with the special key (left-hand thread) through the slot in the pulley; then adjust the flange to the required position (the flange has a right-hand thread), then secure the lock nut. If the top gear is 5 to 1 the low gear would be about 7½ to 1.

Misfiring.

? I have a 7.9 h.p. Indian motor cycle and sidecar, which misfires badly in the back cylinder when running at slow speeds; the trouble, however, is not so pronounced when the throttle is opened. The cylinders and combustion heads have been cleaned of carbon deposit, all joints are air-tight, new high-tension wires have been fitted, and plugs and contact points have been cleaned. Can you suggest anything further that can be done, and advise me in what way it is possible to inspect the brushes of the magneto, which is a Dixie?—F.G.T.

The misfiring in the back cylinder is probably due to oil or grease on the secondary spool. The front carbon brush holder should be removed by detaching the holder cover, which is held in position by two small screws. If a piece of rag soaked in petrol is inserted in the opening and the engine turned slowly the segments on the spool can be cleaned. Should the spool, on examination, be found to be clean, there may be a defect in the condenser or the coil winding, in which case the magneto should be returned to the Hendee Manufacturing Co., Ltd., Indian House, 366-368, Euston Road, London, N.W.1, for repair.

Timing an a.o.v. Engine.

? I have just purchased a 6 h.p. twin Rex motor bicycle, which has suction inlet valves. The valve timing is somewhat incorrect, and I should be pleased

if you would enlighten me on the following: (1) What is the correct method of valve timing where the inlet valves are automatic? (2) What is also the proper magneto timing? (3) Should both suction valve springs be the same tension and the same valve clearance? (4) How can one tell when the inlet valves are operating? (5) Will the correct exhaust valve timing prove sufficient? (6) What do you advise for making the cylinder joints air-tight?—P.

(1.) You need only concern yourself with the timing of the exhaust, which should be as follows: Set the valve to close just after the completion of the exhaust stroke. It will then commence to open when the piston is about one-seventh of the length of the stroke from the bottom of the firing stroke. (2.) The magneto should be timed in the following manner: Place the piston exactly on top of the compression stroke, and connect up the magneto with the points just about to break and the ignition lever two-thirds retarded. (3.) Yes, this should be so. (4.) Only by the fact of the engine stopping, telling you that the automatic valve may not be working. (5.) This question has been already answered. (6.) The only means is to keep the inlet union nuts absolutely tight and the surfaces clean.

Leather Belts.

? I have a 6 h.p. combination driven by a 1½ in. Whittle belt from an N.S.U. gear. Will you please advise me as to how to treat this belt to get the best driving effect from it? I have scraped the dirt off, but am afraid to put any dressing on it, for I think that softening may cause it to stretch. The pulley is in good order. Is this the best belt obtainable? The drive is not satisfactory, but I think it is impossible to obtain satisfaction with this drive.—J.G.

Having cleaned the grit from the belt, you might treat the leather links with collan or castor oil, which will prevent slipping if your pulleys are not worn. This will improve the leather, and will not cause the belt to stretch. The belt can only stretch through wear of the metal links. The belt is quite a good one.

READER'S REPLY.**Difficult Starting.**

Has your correspondent "H.T.V." tried opening the compression taps and turning the engine over before injecting petrol? I have found it quite successful.—CHULT.

Valve Position.

FASHION imposes its will on more things than ladies' dress, and a few notes respecting fashion as applied to valve design will be interesting. In the old days of the automatic inlet valve, operated by the suction of the engine, both valves were carried in a pocket, the inlet over the exhaust and situated in the inlet dome to which the induction pipe was attached. This system was good, but not ideal; it had the effect of cooling the overheated exhaust valve by means of the intruding cold gases impinging upon it: also there was no opportunity for an air leak past the valve stem. Both of these are very real advantages, not to be lightly abandoned. Moreover, the valve pocket was only about half the size which is necessary in the case of side by side valves or where the T shaped cylinder is employed.

When both valves began to be operated mechanically, the side by side method was very naturally adopted owing to the ease with which the valve gear could be constructed for such a system, and the advantages of the mechanically operated inlet were so great compared with the suction valve—especially on twin-cylinder engines, though, strangely enough, it was used on singles for a considerable time before the twins followed suit—that it more than compensated for any advantages which the other position conferred. And, moreover, it is to-day still used in a great number of very excellent engines.

Most American engines had overhead inlets until quite recently, when a very popular engine reverted to the side by side principle. Side by side valves with a cap over each are more accessible than any other type, but this advantage is becoming with every new improvement of less and less value. As the material of which valves are constructed becomes more suitable to its purpose, so does the need for accessibility diminish. Improved cooling, whether by means of water—and we hear excellent accounts of a new water-cooled engine of quite small size and

large horse-power—or the more scientific use of metals having high conductivity and greater attention given to design, also tends to the same end and greatly enlarges the periods for which exhaust valves can run without being ground.

Another method of arranging opposed valves, and one very suitable for use in flat twin engines, is to place the exhaust valves over the inlets instead of the reverse. This has the advantage of removing the hot exhaust pocket farther from the cylinder, and thus not only assists greatly in the cooling problem, but helps to avoid distortion by allowing the cylinder to be more symmetrical in shape and also enables a shorter inlet pipe to be employed—no mean advantage when the pipe is exposed to a blast of cold air.

Now that valve breakages can be ruled out by the use of unbreakable steel (tungsten or stainless), overhead valves are coming into their own, and are likely to become more and more popular during the next few years, either in their usual form of separate inlet and exhaust valves, or in the compound form in which the inlet surrounds the exhaust or *vice versa*. This has the advantage of the cool gases being used to extract heat from the exhaust valve, which would tend to very efficient vaporisation, but it does not give the designer the same latitude in the matter of valve timing as is enjoyed when the valves are in no way connected. Overhead valves can be set in a hemispherical head, and, if combined with a piston having a concave top, they admit of the best possible form of combustion chamber and are undoubtedly more efficient than any other type. There is perhaps more difficulty in rendering the valve gear silent with overhead valves than with the older types, but this should not be beyond the wit of our manufacturers.

Another point in which the overhead valve presents a difficulty peculiar to itself lies in the lubrication of the valve gear. This can be done by enclosing the operating rod in a tube through which oil can pass from the engine or by wick lubricators.

A Steel Sidecar for Lightweights.

A New Design of Sidecar Body embodying Aeroplane Practice.

DETAILS of a neatly designed sidecar, which has recently been patented, have been forwarded to us by the builder, Mr. W. F. Baxter, 180, Wells Road, Totterdown, Bristol. The body is built on aeroplane lines, as the framework is constructed of silver spruce, all members being strutted and braced together, ensuring great rigidity and light weight. The whole of the body is covered with polished steel, while the beading is also metal. The body is consequently waterproof, and has excellent lines. Round the top of the sidecar is a polished mahogany beading which

protects the upholstery from wear. The upholstering is well carried out, and the spring cushions are covered with Rexine.

Both the seat and back of the body are movable, under the seat there is a good tool box, and we understand that provision is being made for carrying a petrol tin at the rear. The back is adjustable, and may be fixed in either a sloping or an upright position. It will be noticed that there is no side door but a convenient step, by means of which the passenger can have easy access to the sidecar. The mudguard is of ample dimensions, and is attached to the body so that it is sprung and there is no chance of its supports breaking.

The sidecar chassis is well made, and there is also a stand which considerably simplifies matters when attention to the sidecar tyre is needed. Coil springs are adopted as the method of suspension, which is found to be quite satisfactory. The weight complete is said to be 110 lb., so the sidecar is suitable for machines of 3 h.p. and upwards. It is hoped that arrangements will be made shortly to make the sidecar suitable for any standard make of motor cycle. Bodies are also supplied for existing sidecar chassis.

A steel sidecar body built on aeroplane lines, all frame members being strutted and braced

Fitting Bowden Controls.

THERE are many facts concerning the fitting of Bowden wire of which the average reader is not aware, and the following hints may be of interest to motor cyclists who do their own repairs, and of value to them in keeping their controls in order.

First of all, the rider must remember that the inner member of the mechanism—that is to say, the twisted wire—should be tinned or soldered before it is cut, and unless this is done the strands will become untwisted and the wire generally unmanageable. Once tinned the wire can be cut by a pair of wire cutters. The brass nipple is then slipped over the wire, and the end of the wire nipped flat to prevent the former

slipping off. The nipple and wire should then be treated with a non-corrosive soldering fluid, and solder should be applied to the back of the nipple. The nipple should then be held in a pair of pliers in the manner illustrated, and the flattened end burred over with a blob of solder. The wire having been well greased with vaseline, the outer member must be slid on, as well as the adjustable stop, and in fitting up the control it should be seen that the lever is in the "off" or closed position. Before fixing finally the wire should be pulled taut, and the place for the nipple marked with a lead pencil. Solder the nipple tightly in position, test the tension, and if this is correct cut the wire.

Get Estimates for Your Repair Jobs.

I SHOULD advise readers not to give orders for any motor cycle repairs without first obtaining a written estimate, in which case they will probably be dumbfounded at the figures. We are all aware that wages have risen and hours have shrunk, but these are not the only items which affect the matter. A friend of mine has just received a bill exceeding £22 for a comparatively minor repair job; the bill includes in round figures £12 for material and £4 for labour, the balance being invoiced as 25% for "establishment" charges, and a percentage on the lot to cover increased costs. The real spike of this portentous account is the "material," which consisted of certain obsolete 1914 parts, to an original value of perhaps 50s. retail. The firm has carried this dead stock for five years, and wants interest on its locked-up capital. In addition, the stock of obsolete spares is probably getting low: perhaps the bits have been allowed to rust during the war; and, finally, the makers may have lost their patterns in the scurry of munition work, and foresee a day when they will have to choose between offending old clients or tackling a very costly job. There may or may not be just cause for complaint in the particular invoice which I have used as an object lesson. Be that as it may, it is rather a damper for buyers of spares. This particular job would not have been worth much over £5 in 1914: in 1919 by putting up the price of spares 400% or so, and saddling all the other percentages on this hugely inflated item, a small repair job is expanded to figures suggestive of buying a second-hand 'bus. So take my tip, and get a written estimate.

Insurance.

THE last paragraph is symbolic of vastly increased charges to be encountered in every item of motor-expenses. For example, the insurance companies have not yet frightened us with any very formidable rise of premiums. Perhaps—like ourselves—they have yet to discover what manufacturers and repairers intend to charge for jobs during 1919. Perhaps they propose to break the dreadful news gently, capture our premiums, and then whittle down the benefits or ask for a war bonus. But the insurance companies are doubtless paying double salaries, like everybody else, and will find every liability in their policies twice as expensive as it used to be. It looks as though complete "cover" for a motor cycle is going to cost as much as a light car policy involved five years ago. I write in no alarmist spirit: I merely observe that plenty of people who can no longer afford to motor on the old scale are clinging to a hobby which is now beyond their means.

On Prices.

I THINK it is time certain firms in the industry realised that unless they are very careful they may kill the goose that lays the golden eggs. So far as current prices of 1919 models go, I have no word of complaint to utter. For example, if the 1914 3½ h.p. Tyre-eater cost £65, £130 would be a fair 1919 price for a similar model: and we are able to buy the 1919 model at £85 by reason of three special factors, namely:

- (1.) The 1914 price admitted of profits which the firm can afford to cut.
- (2.) Production has been cheapened in certain respects, which partly balance the increase in the cost of labour and material.
- (3.) Large munition profits in many cases enable a firm to work temporarily to a reduced margin of profit.

So it is a tenable theory that most of the factories have adopted a wise and self-restrained policy. This will be in vain if their example is not followed by all the auxiliary businesses which complete the industry. That £22 bill of which I wrote in a previous paragraph is an eloquent example of the stupid policy. Riders' salaries or wages may have increased 100%, but that increase is the maximum. The invoice in question has swollen 400% or 500% since 1914. If garage, insurance, fuel, hotel bills, club fees, accessories, repairs, spare parts, etc., are all going to jump up even by 150%, there will be a huge slump in motor cycling and a most dangerous and difficult time for the industry. This can only be avoided if *all* traders tackle their jobs in the spirit of "What is the least I can charge!" (which is—approximately—the manufacturers' policy) instead of "How much can I make?"

In a Nutshell.

THE basic facts of the average rider's position are:

- (1.) Salary up 100% (maximum).
- (2.) Domestic expenses up 120% (minimum).
- (3.) Motor cycling expenses up 7%.

It is obvious that if motor cycling expenses are kept down to a rise not exceeding 100%, which is approximately legitimate, continued ownership of a machine will still be a very tight squeeze for many riders. If motor cycling expenses rise 150%, thousands will be forced to relinquish the hobby. In any case, the public will soon be shaken out of the "easy money" atmosphere which the war has engendered, and a slump of some sort is inevitable within a very few years. Thus, on all grounds, any industry or any section of an industry which profiteers to-day will be sick and sorry to-morrow. The 1914 £65 'bus at £85 in 1919 is a sane signal: if the auxiliary sections

Occasional Comments.—

of the industry can put through a similar policy *mutatis mutandis*, the sport can carry on, and the inevitable slump, when it comes, will just be a lean time and not too serious.

C.G.

ANYBODY who is concerned with aircraft nourishes a profound reverence for the centre of gravity. On motor cycles its location has usually been a mere accident. Werner Bros. in 1899 carried their engine on a small scaffolding built out above the front wheel. Raleighs copied this bad example on their first machine—I think the belt expert's yearning for widely-spaced pulley centres was the prime cause. Anyhow, these machines used to throw you off, jump on top of you, and pummel you. The early "trikes" were even worse. Rider, engine, and tanks were concentrated at the extreme rear with lots of weight *behind* the rear axle: the front wheel was carried on an outrigger all by itself in front, like the elevators of a longhorn Maurice Farman. These "trikes" would throw a back somersault if you set them at a 1 in 5 grade. Gradually matters improved; 28in. frames, triumphantly heralded by one thoughtful Coventry firm in the interests of tall riders, were washed out. But on lots of machines the C.G. is still rather funny. Its location must always be beset with difficulty when you carry a heavy rider rather far back. But reflect when the engine is placed in such machines as the Scott and the new A.B.C.; and then test the general steering and road-holding qualities of these two unconventional layouts.

Boxing in the Engine.

EVERYTHING is moving towards an ideal often quoted by amateur riders. In certain cars—e.g., the four-cylinder Sizaire-Naudin—the engine closely resembles a suitcase set on edge: there are no naked valves, springs, rods, etc., to be seen when the bonnet is lifted. Since a bonnet enshrouds a car engine, such cleanliness of external design is a mere matter of taste where cars are concerned. On motor cycles, where every speck of oil, mud, or dust has to be removed when selling day comes, and is a horrid eyesore in the meantime, an engine bonnet is a practical matter. Refer back to the photograph of the 3 h.p. A.B.C. on page 242 of *The Motor Cycle* for

March 13th and the sketch of the frame given two pages later. It is obvious that the addition of a couple of hinged side shields would cover the nakedness of the works without interfering with cooling. In a current patent J. L. Norton proposes to cowl in the engine with a different motive—i.e., to equalise the front, lateral, and rear cooling. Various pressed steel frames, now being protected, all point in the same direction. Sooner or later, I fancy, motor cycles will come to resemble the hull of a small boat with a fork and wheel projecting from the bows. Then we shall achieve real ease of cleaning.

No Prize Offered.

AS a mere scribbler, I take no stock of gas velocities through inlet valves. I do not know (or care) what a B.T.U. is. It is all one to me whether the ηp of my pet engine is 40 or 200 lb. But I always thought the secret of the aggravating nature of flat twins was "wrop in such mistries": and as a mere layman I stood deferentially aside and meekly accepted the goods which the trade handed out with as little grousing as possible. I refer particularly to the fact that a flat twin engine can either push a rev. counter up to 4,000 or pull a 4 to 1 gear like a cabhorse on its last lap for the mews: but that one

and the same engine never does both. Yesterday a member of the staff burst into my office with the glad news that he had just tried out a new flat twin which combined both *desiderata*. I took down my hat, pocketed my engineers' pocket-book (I keep one on the desk to impress callers), tucked a slide rule into my breast pocket, and clamped a mechanical dictionary in my left armpit. Thus equipped I trotted forth to interview the successful designer. He frothed surds and cosines at me for half an hour by the clock, referred at great length to differential and integral calculus, discoursed learnedly on the precession of the equinox, and finally wound up with a discussion on the value of spectrum analysis. I dipped stealthily into my works of reference at intervals, when he let fly a particularly appalling polysyllable; but in the end I threw myself on his mercy. "Can you tell me simply how it is done?" "I do not know myself," he replied, "and what is more, I want to alter the valve timing, and it may go phut again!" So that's that.

The offices of the Petrol Control Department are being advertised to be sold or let. Should the end of officialdom in connection with the purchase of petrol come in a fortnight's time no one would accuse the Government of being unduly premature considering the great stocks of fuel in the country. *The Autocar* stated definitely last week that control of petrol is to cease.

HILLS ON WHICH I HAVE FAILED.

Some Accounts of Strenuous Motor
Cycling in the Old Days.

By VETERAN.

THE modern hill-climb strikes us surviving pioneers as very small beer indeed. If you are touring, you merely drop down one gear, and perhaps another towards the summit; but when you roar over the crest and past the danger-board, you usually have nearly half throttle in reserve, and very possibly you have never used your emergency gear at all. In a timed competition climb, it is not a question of whether you will get up or not, but whether you can get round the corners at the speed of which your mount is capable. In a six days, the promoters can only introduce an element of chance by switching the entry up perpendicular zigzag goat tracks; and even at that everybody has plenty of engine power in hand. Success is only a matter of whether you can steer round corners resembling a draughtsman's set square, whether the back tyre will grip on sliding shalebanks or six inches of camouflaged morass, or whether some ass stalls just in front of you on the worst bit.

Times have certainly changed since I first rode 200 miles to try Sutton Bank. On that—for me—historic occasion I took along two spare pulleys, two spare belts, and a pulley drawer. I got over the 1 in $3\frac{1}{4}$ bit at the Trough at the first time of asking, but my engine over-heated to such an extent in the effort that it promptly conked out on the easier knuckles round the bend. I eventually completed the ascent in penny numbers.

Amulree, a famous Scottish test hill, which, with its hairpin bends and loose surface, presents a formidable test for man and machine.

Twelve months later I returned with a better engine, a pulley little larger than a florin, and a belt of extraordinary tenacity. With this outfit I made a clean but odorous ascent, accompanied with a stink of burning leather on the upper portions. Prior to that year, and for several years afterwards, we hard riders never made a long cross-country trip without first referring to a Gall and Inglis contour book—my copies are tattered and dog's-eared. If we saw a

(Left) The famous hairpin bend on Applecross Hill.

(Right) The second bend on Kenmore, a hill on which others besides "Veteran" have failed.

steepish line on the contour grades, or a "1 in 7" in the appended notes, we got out our $\frac{1}{2}$ in. flat maps, and invented a *détour*. Even at that, we performed various ritual ceremonies at the foot of such ascents as Dashwood and River Hill. We paused—nominally to light a pipe, actually to let our distorted engines cool down. We drained the hot thin oil out of our crank cases. We renewed our belts, and hammered down our adjustable pulleys with spanners and stones. We unhooked our belts, and extracted 5 in. lengths of belting to balance the gear reduction.

Hills on which I have Failed.—

Finally, we drew deep breaths, and, with palpitating hearts, stormed at the rise. As the pace slowed, we cocked our ears at the exhaust, and presently our wiry, muscular ankles vanished into a blur resembling an electric fan in full blast. This performance was facetiously known as "L.P.A." (light pedal assistance). The last reserves consisted of jumping off and sprinting alongside the conking bicycle; but only exceptionally sturdy fellows were equal to this after a few hundred yards of "L.P.A." For myself, being of a palsy habit of body, I confess that I never combined "L.P.A." and "running with it" in the same instalment. With rare presence of mind I would "L.P.A." until an intolerable weariness in my calves and ankles coincided with a glimpse of some little sheep-track or rabbit alley streaking off obliquely up the side of the hill. Then "L.P.A." had just about served its turn. Remember the conditions of "L.P.A." were:

1. 6½ in. cranks.
2. 60 in. gear.
3. 20 in. fork-to-pedal reach.
4. Heavy waterproof clothing.
5. Road speed of 25-15 m.p.h.

In other words, one "ellpeeaeed" without any support, standing on the pedals. As exhaustion grew, one foot would slip off the pedals, and the tense rider collapsed with a sensation like that of a ripe plum dropped on a barbed wire fence. So the next act was to prop up the bicycle and pause by the roadside, gasping and palpitating. Breath recovered, I would carry the bicycle up the oblique pathlet through the furze and whinberries, reverse the bicycle by a *tour de force*, and roar down again on to the main road for a repetition of the entire process. Before now it has taken me a solid hour to get up Sunrising, Sutton, or Shap or Trow: and even at that I was a better man than most, for I speak of days when the majority of riders knew such hills only by repute, or by riding to the top from the right side, and sniffing timidly down them. About the time that other hardy spirits and I used to organise week-end jaunts to those precipices (as we then regarded them), there was a heated discussion in the M.C.C. Committee as to whether or not the first London-to-Edinburgh run should be held, some experts maintaining that the percentage of failures would strike an irreparable blow at the hobby. Yet, as every good roadman knows, there is hardly a bump on the whole 400 miles of the Great North Road up which a motor scooter could not

pull a coachbuilt sidecar with a passenger. Two years or so I had acquired quite a county reputation by riding a 1¾ h.p. Ormonde minus pedals up a slope that might be likened to 800 yards of Ludgate Hill: yes, and I won a cool fiver by doing it!

The Coming of Variable Gears.

The real snag came when sundry leading clubs began to support *The Motor Cycle* campaign in favour of variable gears. Incredible as it sounds, the trade frowned on the movement. With the exception of a few

firms—the P. and M. two-speed, the "Anglian" dog-clutch three-chain drive, and Hooydonk's Phoenix hub, no factory offered anything but single gears. This journal did much to educate public opinion and render it articulate. At last the Edinburgh M.C.C. leapt into the breach. It endorsed our policy that a roadworthy bicycle should be able to climb any main road hill in the district where it is used. So the Scottish Trials were sent up Glencoe, Rest-and-be-Thankful, Amulree, Cockbridge, and

Rest-and-be-Thankful, a Scottish hill over four miles in length, between Arrochar and Inveraray.

other stiff climbs, which no A.C.U. Committee of that era dare have mentioned.

Piteous sights were witnessed. I have seen athletes "cooked" at every conceivable sport—boxing, rowing, running—but I never saw men done quite so brown as some of the plucky riders in the earlier Scottish Six Days. Happy was the entrant who belonged to a maker's team or an unofficial team of two or three pals. The duo or trio could share the arduous toil of pushing one machine up, and come down again to fetch the remainder. The policy paid beyond our dreams. Manufacturers were stung by the ridicule heaped on their miserably inadequate designs. The A.C.U. and lesser English clubs awoke to find that the Edinburgh sportsmen had stolen their prestige away, and that the Scottish Six Days was the blue ribbon of the year. Pathfinding patrols were organised from Piccadilly, and the trade realised with a shiver that variable gears had *got* to come. So to-day the motor cycling novice can buy any standard touring machine and go where he will on it: he would not fail on any hill of less formidable calibre than Kenmore or Applecross: and, if he fails there, he must blame himself and not his mount. As he roars blissfully up tortuous grades of 1 in 5, let him remember that he owes his tickly sensations to forgotten men who sweated and strained to teach the motor cycling world the folly of single-gears. *Moi, qui vous parle*, have pushed 2 cwt. up perhaps 200

BIRMINGHAM M.C.C. RELIABILITY TRIAL.

THE

"14 POINTS" OF THE NEW 3 H.P.

"FUNDAMENTALLY DIFFERENT
from the ordinary run of Motor Cycles."

Mr. B. H. Davies in "The Motor Cycle."

*Ideal
for
Sidecar
Work.*

1. Perfectly balanced engine.
2. Overhead valves.
3. Detachable cylinder heads.
4. Steel cylinders.
5. Hand-controlled enclosed clutch.
6. Four-speed gate-change gear box
7. Enclosed transmission
8. Perfect suspension.
9. All black finish.
10. Adequate weather protection.
11. Single lever control.
12. Car-type brakes
13. Real quietness.
14. Automatic lubrication.

Price £85.

Registered Offices and Works :
KINGSTON - ON - THAMES.

Hills on which I have Failed—

miles of single-figure gradient, all told, since 1903: and, when my toes turn blue in bed on a winter night, I grimace as I recall how I did in a valve of my heart years ago: for the doctors have still to learn the trick of grinding in that kind of valve. And there are others. Speaking from memory, I fancy only three riders out of the entire entry climbed Amulree in the saddle the first time we sent the Scottish Trial up that lovely hill.

If I may digress to point a moral, there is absolutely no novelty in the principles of the average 1919 gear box, be it of the hub or countershaft variety. You may wangle a patent for one even now, but for decades past such patents were only to be had by grafting some tuppenny ha'penny detail on to an antique gadget, which Boadicea probably used on special chariots reserved for mountain warfare. The trade got into a groove over single gears: and it was jerked out by a little Scottish dynamite and journalistic fulminate of mercury. We might just as well have had one, two, or three-speed gears in 1903. Clubs, press, and users must protect the industry from getting bogged in other grooves. The price groove. The weight groove. The rigid frame groove. The four-hours-to-clean groove.

I notice I have yet to mention climbing with a passenger. Well, it simply was not done. Of course, it could not be. The old quads were an exception, certainly. They hailed from France. The French engineers may at least boast that they had heard of the epicyclic gear as long ago as 1900. De Dion and Peugeot quads came over fitted with Bozier and Dupont epicyclic two-speeds: Dennis, Enfield, and other British firms sent across and bought some. I admit that these quads were not exactly perfect. Eight miles an hour up River Hill was good going: but it had its advantages, for, if the grade stiffened

or the engine was out of tune, you and your lady stepped overboard, without fuss or scurry, and walked alongside at 4 m.p.h. When the old 'bus slowed to 2 m.p.h., you could push. Legend has it that a weary old quaddist in the Seven Oaks district used to help his quad up hill by pulling up the spokes—!! But the noise! A marine store in an earthquake was a dim, religious hush compared to it.

Then the quad went out and we took to the trailer—behind a single gear, of course. I need only say that slim, *petite* damsels caught our fancy: the rosy-cheeked country maid or hockey lass we were obliged to deem somewhat blowzy. Look up the records of the first M.C.C. Interclub Team Competition. After many searchings of heart, the management compelled each sextette to include one passenger machine. A potty course was chosen. I fancy the brief slope up to Aynho Station in Northants was the only climb. But the clubs had a rare job to unearth

passenger combinations which could look at it: and the favourite stunt was a big racing machine and trailer with two midget jocks for its crew. The tricarb boom of 1906 was an interlude. Some of these machines could climb to beat the band. But they went pop just as the cycle car did a few years later. Meantime, the moral was being mastered. Variable gears are all but universal. They have knocked much of the sport out of motor cycling. They have camouflaged certain grave shortcomings in the petrol engine. They tend to degrade motor cycling into a utilitarian locomotion

Sutton Bank, Yorkshire. This hill at one time was accounted most formidable. Even in these days of speed feats it is a hill which requires careful negotiation.

for duffers. But they have at least given Britain's sons the freedom of Britain's finest roads: and that is no mean achievement.

As a postscript let me justify an ill-chosen title by saying that I do not think there can be any hill in England, Wales, or Scotland on which I have *not* failed.

THE SUPPLY OF BENZOLE.

The British Motor League has made arrangements to supply its members with benzole of the best quality in any quantity at the very moderate price of 2s. 6d. per gallon, which is 2d. per gallon cheaper than benzole can be obtained usually in fifty-gallon drums. At this price, the benzole, which is guaranteed

to pass the National Benzole Association's tests, is delivered free to any address in London, or, in the case of country members, at any railway station in England, Wales, or South Scotland, likewise carriage free. Particulars may be obtained from Mr. Hugh Scott, 28, Fleet Street, London, E.C.4.

THE VICTORY CUP TRIAL ANALYSED.

Victory Cup won by a Rider of a Two-stroke Lightweight.

77 Entrants, 73 Starters.
62 complete the Course.
40 Gold Medals.
11 Silver Medals.

THAT over fifty per cent. of the entrants for the Victory cup trial secured gold medals may convey an impression to those who do not know the course that the reliability and power of the modern machine had been under-estimated by the Birmingham M.C.C., who organised the trial. It has, however, been proved before that, where it is possible for a wheel to obtain grip, the machine of to-day, and even of 1914, will climb with success, provided the rider can handle it.

The roads were dry, and, except for the dust, which was very trying, conditions were ideal for the competitors. Had it been wet, we think the results would have been very different; the first hill and Rising Sun alone would have considerably reduced the number of gold medallists.

It is perhaps only fair to the makers of the machines that failed, to say that the personal element was responsible for more failures than mechanical troubles.

The course was a well-known one, and for several years before the war we watched the gradual improvement of motor cycles on the same hills, excepting Beacon Hill—a narrow, deeply rutted lane near Bromsgrove. The other hills were the Old Wyche Cutting, Portway (near Painswick), the famous Birdlip, Rising Sun (or Gambles Lane, to give it its local name), and Sudeley.

Competitors were credited with 100 marks at the start. There were four non-stop sections, to stop in any of which meant the loss of 12 marks, while for failures on the test hills competitors were debited with losses in proportion to the severity of the hill. Failure on Beacon Hill represented 11 marks, on the Old Wyche 6, Portway 8, Birdlip 10, Rising Sun 7, and Sudeley 8. To qualify for a gold medal, competitors had to secure 97% of the cup winner's marks, while lightweight riders were allowed to

(Left) E. Kickham, 4 h.p. Douglas, on Portway Hill.

(Right) A Norton outfit on Beacon Hill.

drop to 88%. Silver medallists could lose 8% marks, and in the lightweight class 17%. The winners of the cups were decided by a speed judging test over a distance of two and a third miles.

The condition of Beacon and Rising Sun was very bad. The latter was particularly rough.

With so many new-comers to the pastime, it is perhaps natural that a great number of our readers should be interested in the performance of the machines in the first of the post-war trials to be held in Great Britain, and, appreciating this, we have analysed the results as below:

A.J.S.

Five A.J.S. machines were entered as under, and each was successful in obtaining 100% marks, thus obtaining gold medals:

W. Stevens (6 h.p. A.J.S. sc.), gold medal.
F. W. Giles (6 h.p. A.J.S. sc.), gold medal.
W. Choldercroft (4 h.p. A.J.S. solo), gold medal.
W. Jameson (6 h.p. A.J.S. sc.), gold medal.
J. Stevens (6 h.p. A.J.S. sc.), gold medal.

PREMIER AWARDS.

VICTORY CUP.

Presented by Lord Calthorpe for the best performance by any machine.

G. KUHN, 2½ h.p. Levis two-stroke.
62×70 mm. 217 c.c. Enfield two-speed gear.
Amac carburettor.

DUKE CUP.

Presented by R. W. Duke, Esq., for the next best performance.

G. A. DALBY, 4 h.p. Triumph sidecar.
95×97 mm. 550 c.c., S.A. gear box.

EVANS CUP.

Presented by P. J. Evans, Esq., for the best performance by member or ex-member of H.M. Forces.

G. KUHN, 2½ h.p. Levis two-stroke.

Ariel.

The Ariel has a 499 c.c. engine, and, as we have frequently pointed out for such hills as Sunrising, a machine with this size of engine is slightly under-powered. However, one of the sidecars made a very good show. Oerton failed on Sunrising and retired. Newey stopped on Rising Sun only.

F. J. Watson (3½ h.p. Ariel), gold medal.
L. Newey (3½ h.p. Ariel sc.), silver medal.
Chas. Oerton (3½ h.p. Ariel sc.), retired.

Allon.

Only one Allon two-stroke entered. This was ridden by J. W. Milner, who retired with engine trouble, which was unfortunate.

J. W. Milner (2¾ h.p. Allon), retired.

Blackburne.

The single 4 h.p. Blackburne entered secured a gold medal with 100% marks.
J. A. Watson-Bourne (4 h.p. Blackburne), gold medal.

B.S.A.

No fewer than eight B.S.A.'s started.

Nicholls failed on Rising Sun, W. R. Steel on the Wyche, Farr and Hill lost marks through being late at control. However, to obtain eight awards out of eight entrants is a very good performance.

C. Percival (4¼ h.p. B.S.A.), gold medal.
L. L. Sealey (4¼ h.p. B.S.A.), gold medal.
L. Baker (4¼ h.p. B.S.A. sc.), gold medal.
H. R. Lane (4¼ h.p. B.S.A.), gold medal.
R. H. Nicholls (4¼ h.p. B.S.A. solo), silver medal.
W. R. Steel (4¼ h.p. B.S.A. sc.), silver medal.
A. H. Farr (4¼ h.p. B.S.A.), silver medal.
A. E. Hill (4¼ h.p. B.S.A.), silver medal.

Chater-Jap.

H. Boynton (8 h.p. Chater-Jap), retired.

SCENES AT THE VICTORY CUP TRIAL.

(1) P. W. Moffatt on the new $3\frac{1}{2}$ h.p. spring-frame Douglas ascending Portway. (2) D. R. O'Donovan (Norton sidecar) climbing the Old Wyche. (3) H. R. Lane ($4\frac{1}{4}$ h.p. B.S.A.) on the lower part of Rising Sun. (4) J. Stevens ($4\frac{1}{4}$ h.p. James sidecar) on the Old Wyche. (5) The crowd of spectators on the Old Wyche, illustrating the new interest of the general public in motor cycles. (6) H. B. Dealey (Morgan) on Rising Sun. (7) L. L. Sealey (B.S.A.) and W. J. Hassell (4 h.p. Norton sidecar) at the bottom of Beacon Hill. (8) A Sunbeam on Birdlip.

The Victory Cup Trial Analysed.—

Connaught.

Only one Connaught was entered, and this usually good performer in trials of this nature stopped on the Old Wyche, Portway, and Rising Sun.

L. H. Boughton (2½ h.p. Connaught), no award.

Douglas.

There were four Douglas machines entered, three of which were ridden by well-known competition riders, the fourth being C. Pearson on a 4 h.p. model with sidecar, with which he failed to negotiate the test hills, and consequently received no award. The other three riders, however, did well.

P. W. Moffatt (1919 3¼ h.p. Douglas), gold medal.
N. B. Gibb (2¾ h.p. Douglas), gold medal.
C. Kickham (4 h.p. Douglas sc.), silver medal.
C. Pearson (4 h.p. Douglas sc.), no award.

Kickham stopped on Rising Sun only.

Diamond.

The two Diamond lightweights entered secured gold medals.

A. Milner (2½ h.p. Diamond), gold medal.
H. Minton (2½ h.p. Diamond), gold medal.

Enfield.

One 3 h.p. Enfield was entered, and secured a gold medal.

B. L. Bird (3 h.p. Enfield), gold medal.

Harley-Davidson.

Three of these big twin sidecars were entered, and put up a good performance, winning two gold and one silver medal. Masters attempted to climb Rising Sun on second gear and stopped on changing.

H. Notbeck (7 h.p. Harley sc.), gold medal.
W. A. Fell-Smith (7 h.p. Harley sc.), gold medal.
J. A. Masters (7 h.p. Harley sc.), silver medal.

Humber.

One 3½ h.p. flat twin represented the Humber, and, piloted by Sam Wright, secured a gold medal.

S. Wright (3½ h.p. Humber), gold medal.

Ivy.

S. Smith (2¼ h.p. Ivy), retired.
H. Smytheman (2½ h.p. Ivy), no award.

Indian.

The two Indians did well, the machine driven by Bridgman being the new 1919 model.

E. A. Bridgman (7 h.p. Indian sc.), gold medal.
E. D. Oliver (7 h.p. Indian sc.), gold medal.

James.

Eight James machines of several types were entered, but did not have the best

of luck. H. H. Saddington, on a 5-6 h.p. with sidecar, turned over at one of the corners, and afterwards retired; and Pollock on a 3½ h.p. twin stopped on the Old Wyche. However, with six medals to their credit, the James performance, on the whole, was very good. Eric Williams, the winner of the last Junior T.T., won a "gold."

S. Stevens (4¼ h.p. James sc.), gold medal.
J. Allday (3½ h.p. James twin), gold medal.
Eric Williams (3½ h.p. James twin), gold medal.
S. E. Muchlow (4¼ h.p. James sc.), gold medal.
J. F. Edstone (5-6 h.p. James), gold medal.
R. E. Wintle (4¼ h.p. James), silver medal.
T. Pollock (3½ h.p. James twin), no award.
H. H. Saddington (5-6 h.p. James sc.), retired.

Levis.

With two entries, the Levis secured the Victory Cup, the Evans Cup, and a gold medal.

Gus Kuhn (2¼ h.p. Levis), Victory and Evans Cups.

P. Pike (2¼ h.p. Levis), gold medal.

Morgan.

H. B. Dealey on a Morgan secured a silver medal. A chain came off the sprocket on Rising Sun.

H. B. Dealey (8 h.p. Morgan), silver medal.

Matchless.

Only one Matchless was in the trial, and this was piloted by Rex Mundy, who had the misfortune to break his throttle wire.

Rex Mundy (8 h.p. Matchless), no award.

New Imperial.

Two of these well-known lightweights were entered, and one did exceptionally well, securing a gold medal with 100% marks. The other entrant, however, made a performance the reverse of good, which, since the machines were identical, shows the influence of the human factor.

B. Kershaw (2¼ h.p. New Imperial), gold medal.
P. S. Taylor (2½ h.p. New Imperial), no award.

New Comet.

A. H. Haden, jun. (8 h.p. New Comet), no award.

Norton.

It was certainly not one of the Norton's luckiest days, and with nine entrants only four gold medals were obtained. W. J. Hassell retired with gear trouble, O'Donovan turned over on Birdlip, and Cutler had tyre troubles which forced him to retire.

H. A. Pattman (4 h.p. Norton sc.), gold medal.
H. Hassell (4 h.p. Norton), gold medal.
L. Southwell (4 h.p. Norton), gold medal.
H. Petty (3½ h.p. Norton), gold medal.
— Mansell (4 h.p. Norton sc.), retired.
D. A. S. Cleese (4 h.p. Norton), retired.
H. P. Cutler (4 h.p. Norton sc.), retired.
W. J. Hassell (4 h.p. Norton sc.), retired.
D. R. O'Donovan (4 h.p. Norton sc.), retired.

Rover.

The only Rover entered was a 5-6 h.p. twin, ridden solo, and as the rider went off the course he obtained no award.

J. F. Gardner (5-6 h.p. Rover), no award.

Radco.

G. A. Lovegrove (2½ h.p. Radco), no award.

Sun-Villiers.

— Gilmour (2½ h.p. Sun-Villiers), gold medal.

Sunbeam.

The six Sunbeams entered each secured an award, five of them winning gold medals. De la Hay stopped on Rising Sun.

J. Drew (3½ h.p. Sunbeam sc.), gold medal.
J. E. Greenwood (8 h.p. Sunbeam sc.), gold medal.
W. Frankham (3½ h.p. Sunbeam sc.), gold medal.
J. Dudley (3½ h.p. Sunbeam sc.), gold medal.
G. Dance (3½ h.p. Sunbeam), gold medal.
L. C. de la Hay (3½ h.p. Sunbeam), silver medal.

Triumph.

Three Triumphs were entered by private owners, one of whom, with sidecar, won the Duke cup, another a gold medal, and the third—Stretton Ward—unfortunately fell on the rough surface at the foot of Beacon, and so lost his award.

G. A. Dalby (4 h.p. Triumph sc.), Duke Cup.
E. Kibble (4 h.p. Triumph), gold medal.
H. J. Stretton Ward (4 h.p. Triumph), no award.

Zenith.

One Zenith only was entered, and this secured a silver medal.

R. Charlesworth (5 h.p. Zenith sc.), silver medal.

OBSERVATIONS ON THE TEST HILLS.

Beacon Hill.

The majority of riders climbed Beacon Hill steadily, but a few opened the throttle and went up with a dash. W. J. Hassell (4 h.p. Norton sc.) charged up, the sidecar wheel leaving the ground several times on the uneven surface. The Levis lightweights were fast, as was also Kickham (4 h.p. Douglas sc.). Gibb (2¾ h.p. Douglas) made a very steady but high speed climb.

Only a few failures were recorded on this hill.

The Old Wyche (1 in 2.9).

Hundreds of spectators gathered on the Old Wyche, and no doubt had a capacious grandstand been erected it would have been filled. Unfortunately many non-competitors elected to try the hill during the competition, with the

The new 3½ h.p. spring frame Douglas. P. W. Moffatt successfully piloted this machine through the trial.

E. Kickham, 4 h.p. Douglas, and Dinky sidecar.

The Victory Cup Trial Analysed.—

result that both Boynton (Chater-Jap) and A. H. Haden (New Comet) were baulked. Gilmour, an Australian who entered at the last minute on a Sun Villiers, failed to make a clean ascent, his only failure, and Rex Mundy (Matchless) gave a display of clever driving at the top corner when he was obliged to slow down to a crawl to avoid Newey (3½ h.p. Ariel sc.).

Portway (1 in 5).

Nine competitors failed on Portway, upon which performances were consistently good. Saddington (5.6 h.p. James sc.) turned over, otherwise there was little incident to report.

Birdlip (1 in 5).

As this hill was in very good condition, it was the scene of many exceptionally fast climbs. Most of the solo singles ascended the hill fast without recourse to their low gears. Charlesworth (5 h.p. Zenith sc.) made a very fast climb. Gardner's twin Rover, J. A. Masters (8 h.p. Harley-Davidson sc.), and Gibb (2½ h.p. Douglas), too, were very fast. Giles (6 A.J.S. sc.) did not change down until he reached the last thirty yards.

Rising Sun (1 in 4½).

Gambles Lane (Rising Sun) was once more the "tit-bit" of the trial. The surface was very loose, and to control a machine on it required skill more than the average rider possesses. The majority of riders took the hill too fast, with the result that on the top stretch the machines became difficult to manage. The big concourse of spectators who lined the hill left but a narrow defile for the competitors, which, as usual, added to their difficulties.

What impressed us most was the manner in which the majority of single-cylinder sidecars ascended this hill. Instead of the all-out rush in bottom gear with which we were familiar before the war, these machines went up steadily, picking their way, and revealing a greater reserve of power than one would expect with engines in the neighbourhood of 500 c.c.

Fell Smith (Harley-Davidson sc.) made a sensational climb, passing another competitor in the narrow lane. Again, both Levis machines made good climbs. Masters (Harley-Davidson sc.) nearly reached the top before changing gear, and then stopped, but made an excellent restart. De la Hay (Sunbeam) fell, and Steel (B.S.A. sc.) got mixed up with the spectators, but made a clean ascent. Wintle (James) stopped, but made an excellent restart on the steepest part of the hill. Mundy (Matchless), with his throttle wire wrapped round a lead pencil in his hand, made a very fast climb.

Summary of Results.

	Gold medal	Silver medal	No award	Retired
Starters.	14	8	0	5
Lightweights	14	8	0	5
Solo singles	17	9	5	1
Sidecar singles	15	8	2	0
Solo twins	12	9	0	2
Sidecar twins	14	7	3	1
	72	41*	10	11
Morgan	1	0	1	0
	73	41	11	10

*Including cup winners.

From the above it will be seen that the solo singles made the best average performance, 82% securing awards. Twin sidecars came next with over 78%, followed by twin solos 75%, and single sidecars over 66%. Only 57% of the lightweights secured awards. In the matter of gold medals the solo twins carried off the palm with 9 medals out of a possible 12.

Retirements.

The retirements were highest among the sidecar singles, 33% of the starters retiring. The lightweights came next with 28%. The solo singles, solo twins, and sidecar twins have one retirement each, which represents 6%, 8% and 7% respectively.

BY THE WAY.

Several "Hush" models were in the trial, including the 1919 model 3½ h.p. spring frame Douglas, a 2½ h.p. spring frame New Imperial, and a Sunbeam with laminated springs fore and aft.

Rex Mundy (Victory Matchless) drove the major portion of the trial with a broken throttle wire in his hand. Notwithstanding, he made one of the best climbs on Rising Sun.

F. G. Edmond was seen on the Wyche, as a non-competitor, toying with the hill on a 1920 chain-driven Triumph sidecar.

Many non-competitors showed lack of sportsmanship by insisting upon trying Rising Sun in between the competitors. The egotism required to do this before such a crowd of spectators was pitiful to behold. We did not sympathise, however, with those who failed.

The new Douglas ridden by Moffatt had no exhaust noise under normal conditions. The running of the machine reminds one of a sewing machine.

There were 5,000 teachers in Cheltenham attending a convention. Result, no lunch.

One of the Norton sidecars carried an extra passenger on the pillion.

Several competitors were baulked by non-competitors.

Albert Milner, still in khaki, mounted on a Diamond, caused some amusement on the Old Wyche by raising his front wheel off the ground at the top of the hill.

Gibb's 2½ h.p. Douglas had a very pleasing exhaust note, and climbed exceptionally well.

W. H. Egginton, the Birmingham M.C.C. secretary, was riding a 6 h.p. Sunbeam as an official, with his crutches in the sidecar. He is slowly recovering from a bad accident sustained some time ago.

"Dignity and Impudence" was the title given to a big Harley-Davidson with a Canoelet racing sidecar having an enormous head light.

Bridgman's 1919 Indian sidecar gave a good impression.

Several of Kickham's "Dinky" sidecars were fitted to competing machines, and were voted to be the roomiest sporting sidecars ever seen.

J. Dudley (3½ Sunbeam) received quite an ovation for his ascent of the Wyche.

Pike's Levis, with which he won a gold medal, had the smallest engine in the trial, the capacity being 198 c.c., and did the entire course—126 miles—on less than a gallon of petrol.

A B.S.A. rider was mistaken for "Pa" Applebee.

In the time check at British Camp, near Malvern. Messrs. Lycett and J. T. Urry are seen busy examining the rider's sealed watch.

Sheffield and Hallamshire M.C.C.

A speed-judging competition has been arranged for the 10th inst., and the competition for the Dickenson and Darwen Cup will be held on the 24th.

Sutton Coldfield and Mid-Warwickshire A.C.

Mr. W. Hughes Butterfield is organising the half-day reliability trial on the 17th inst., and the route is a secret one, and will include at least two newly discovered hills.

A Colchester Club.

It is suggested that there is room for a motor cycle club in Colchester. Local motor cyclists should get together and organise a club.

The Junior Car Club.

On the 4th inst. the Junior Car Club will hold a run to Arms Hill, Henley; several members expect to make an attempt to climb the well-known gradient. Members are to meet at the foot of the hill at 2.45 p.m. To avoid the Uxbridge Road, which is in very bad condition, those travelling from London should proceed via Brentford, Hounslow, Colnbrook, and Slough.

N.M.C.F.U. (Wolverhampton).

The Wolverhampton Branch of the N.M.C.F.U. has been reorganised. A new committee has been elected, which is doing its best to place the branch upon a real business footing. The secretary's name is Mr. G. H. Sanders, and interested motor cyclists should communicate with him at 199, Dunstall Road, Wolverhampton.

Streatham and District M.C.C.

This well-known club is holding an opening run, on Saturday next, to the club's country headquarters, the Clayton Arms, Godstone, when, it is hoped, there will be a general reunion of old members. Prospective members and other visitors are also invited. The run is in the afternoon, so it is anticipated that the attendance will be a large one. The club is endeavouring to organise a late autumn open reliability trial.

Purley and District M.C.C.

We have had a letter from the hon. sec. of the Purley and District M.C.C., L.-Cpl. S. J. Taylor, 201,653, 2/5th Durham Light Infantry, Salonika Army. He states that he will be glad if any demobilised members of the old club (moribund since 1915) will communicate with him with a view to restarting it. Unfortunately, Mr. Taylor sees no prospect of returning home till 1920, so he trusts that any old members will set to work to revive the club, appoint a new hon. secretary, and proceed with a new programme. His father, Mr. E. Taylor, 19, Clifton Road, Wallington, Surrey, will hand over the necessary books and club papers.

Future Events.

May 3.—Birmingham M.C.C. Social Run to Warwick.

May 3.—Streatham and District M.C.C. Reunion at the Clayton Arms, Godstone.

May 3.—York and District M.C. Social Run.

May 4.—Bolton and District M.C. Reliability Trial.

May 4.—Harrogate and District M.C.C. Social Run and Picnic, Bylands Abbey.

May 4.—Ilkeston and District M.C.C. Run to Buzton.

May 4.—Liverpool M.C. Social Run to Llandudno.

May 4.—N.M.C.F.U., Sheffield. Reliability Run to Knutsford.

May 4.—Wolverhampton M.C.C. Social Run to Farlow Bank.

May 4.—Junior Car Club. Run to Arms Hill, Henley.

May 4.—Eastern Counties M.C. Competition, Audley End.

May 7.—York and District M.C. Slow Hill-climb, Garrowby.

May 10.—Exeter and District M.C.C. Opening Run.

May 10.—The M.C.C. Speed-judging Competition.

May 10.—Sheffield and Hallamshire M.C.C. Speed-judging Competition, Mam Tor.

May 10.—Wolverhampton M.C.C. Reliability Trial.

May 11.—Eastern Counties M.C. Run to Southend.

May 11.—Ilkeston and District M.C.C. Run to Ollerton.

May 11.—N.M.C.F.U., Sheffield. Run to Dovedale.

May 17-18.—Birmingham M.C.C. Week-end Touring Competition to Llangollen.

May 17.—Liverpool M.C. Social Run to Llangollen.

May 17.—Sutton Coldfield A.C. Half-day Trial.

May 17.—Woolwich, Plumstead, and District M.C.C. Open Trial for Matchless Cup.

May 21.—York and District M.C. Reliability Trial.

May 24.—Sheffield and Hallamshire M.C.C. Competition for Dickenson and Darwen Cup.

June 6.—M.C.C. London-Edinburgh Run.

June 7-9.—Birmingham M.C.C. Trial to Land's End.

August.—A.C.U. Six Days Reliability Trials.

Birmingham M.C.C.

Gus Kuhn (2½ Levis), the winner of the Victory and Evans Cups in the Victory Cup Trial, obtained 100 marks, and in the speed-judging competition was 16s. out. G. A. Dalby (4 Triumph sc.), winner of Duke Cup and gold medal, 100 marks, 24½s. error in speed-judging. The smallest error was Boughton (Connaught), ½s.; the greatest error Nottbeck, 1,123s.

N.M.C.F.U. (Sheffield).

Entries for the reliability run to Knutsford on the 4th (entrance fee 1s.) may be received up to to-morrow. Mr. L. B. Henderson will present a gold medal to the winner, and three other prizes are offered if sufficient entries are received. Those interested should communicate with the hon. secretary, Mr. W. Wright, 48, Hinde Street, Firth Park, Sheffield.

Essex M.C.

The results of the recent speed and distance judging competitions are now announced as under:

SPEED JUDGING COMPETITION.

E. Varney (Triumph) ...	51 secs.	Error.
—, Wellington (Triumph) ...	3 mins.	

DISTANCE JUDGING COMPETITION.

C. Pearson (Douglas) ...	1,100 yds.	Error.
--------------------------	------------	--------

Blackheath and District M.C.

A meeting will be held at the White Hart Hotel, Bromley, Kent, on Saturday, the 10th inst., at 8 p.m., to discuss the reformation of this club. All motorists and motor cyclists interested are invited to be present. The honorary secretary is Mr. J. S. Wilson, Burnham Lodge, Lake Avenue, Bromley, Kent, who will be glad to forward information to prospective members.

Farnham and District M.C.C.

At a general meeting held at the Bush Hotel, Farnham, the above club was formed with a membership of thirty. The subscription was fixed at 7s. 6d. per annum. It is the intention of the committee to hold a large number of social runs, as well as competitions. Interested local motor cyclists should communicate with the joint hon. secs., Messrs. A. F. Bateman and L. J. Mitchell, "The Lindens," Farnham, Surrey.

Ilkeston and District M.C.C.

The runs of the newly-formed Ilkeston and District M.C.C. have been very successful up to the present, and well attended by its members. The run to Skegness was a very pleasant outing.

The club is enrolling many new members, and a very strong membership is anticipated. Motor cyclists in the district who would like to enjoy the benefits of club runs should make application to become members to Mr. A. Checkland, 106, Bath Street, Ilkeston.

Wolverhampton M.C.C.

This club is now in full swing with Mr. A. O. Haskins, 15, King Street, Wolverhampton, as secretary. A reliability trial is being organised for the 10th inst., and arrangements are in hand for an open hill-climb.

Over 500 Motor Cycles at N.M.C.F.U. Rally.

The Gathering of National Motor Cyclist Fuel Union Members at Stratford-on-Avon produces a Record Number of Participants.

ABOUT 550 members of the N.M.C.F.U. congregated at Stratford-on-Avon for the intermeet organised by the Birmingham and Coventry branch secretaries, and these were mounted on almost every conceivable type of machine, both ancient and modern.

Almost everywhere the owners' keen interest in their machines was in evidence, and as many of the members are mechanics it was not surprising to find that, in many cases, the makers' design had been "improved" in detail.

For example, one of the most attractive outfits we saw was a Harley-Davidson, upon which the owner, a Mr. Bateman, of Coventry, had lavished much thought, time, and money. The mudguards were of his own make, and followed A.J.S. lines to some extent. Each was made in one piece of heavy gauge material. The guards were certainly the best we have seen. Other improvements included a hot air muff on the induction pipe, a special type of extra air valve, a thief-baffling device, and a three-sided sidecar screen. The machine was very complete as to electric lamps, and the sidecar was ornamented with a mascot.

Another machine which created a great deal of interest was a $3\frac{1}{2}$ h.p. solo Sunbeam finished all black, with disc wheels, electric light, and chain-cum-belt drive, while near by stood a Premier "flying bedstead," one of the machines with $3\frac{1}{2}$ h.p. single-cylinder engine and outside flywheel, etc., built for the 1914 T.T. The owner had reduced the compression ratio and fitted chain cases.

Picnic Equipment.

Almost every sidecar carried one or more small children, and picnic baskets seemed to be part of the standard equipment in most cases.

The organisers had made arrangements to park the machines in groups according

to the centres from which they had come. We noticed groups of various numbers from Sheffield, Leicester, Derby, Birmingham, and Coventry. Naturally, the Birmingham and Coventry centres were well represented.

New Models.

The display of 1919 models was somewhat disappointing. The new Rex, a 6 h.p. Rover, an A.J.S., and the Coventry Victor were noticed. The last mentioned is a flat twin of unusual design, with the gear box mounted high up in the frame.

During the day there were speeches by officials, including Mr. A. W. Torkington, the president of the Union, and a cinema operator was very busy during the run out for the circular tour of ten miles. Later there was a demonstration by Coventry testers in fancy costume, which, however, we think, was not quite appropriate for a Sunday event. On the whole, the organisers, Messrs. Murray and Malilieu, are to be congratulated upon a very successful rally of members of the N.M.C.F.U.

(Top) A smart Enfield sidecar outfit seen at the N.M.C.F.U. rally. A small mascot of Cupid will be seen on the sidecar.
(Left) A well-equipped Harley-Davidson attracted much attention. The design of the windscreen is worthy of note.
(Right) An all black $3\frac{1}{2}$ h.p. Sunbeam, with disc wheels, the appearance of which was particularly admired.

MOTOR CYCLING AT CHRISTCHURCH, NEW ZEALAND.

ON February 15th the Pioneer Sports Club, Christchurch, New Zealand, held its annual carnival, which proved very successful. Results:

LIGHTWEIGHT HANDICAP (EIGHT MILES).—
Machines up to 600 c.c.

1. F. Haworth ($2\frac{1}{2}$ Triumph) ... 70s.
 2. G. Moffatt ($4\frac{1}{2}$ B.S.A.) ... 30s.
- Time, 9m. 17 $\frac{1}{2}$ s. 51.6m.p.h. Seven started.

SOUTH ISLAND MIDDLEWEIGHT CHAMPIONSHIP (TEN MILES).

1. F. Haworth ($2\frac{1}{2}$ Triumph).
 2. G. Moffatt ($4\frac{1}{2}$ B.S.A.).
- Time, 10m. 14 $\frac{1}{2}$ s. 58.5 m.p.h.

AUSTRALASIAN HEAVYWEIGHT CHAMPIONSHIP (FIFTEEN MILES).

1. H. R. Crawley (7 Harley-Davidson).
 2. L. Mangham (7 Harley-Davidson).
- Time, 14m. 12s. 63.4 m.p.h.

TOURIST HANDICAP (FIVE MILES).—Open to any power.

1. L. D. Bamfield ($2\frac{1}{2}$ Douglas) ... 210s.
 2. E. G. Barrell (7 Indian) ... 110s.
- Time, 8m. 26 $\frac{1}{2}$ s. 35.5 m.p.h.

OPEN HANDICAP (EIGHT MILES).

1. F. Haworth ($2\frac{1}{2}$ Triumph) ... 150s.
 2. N. Souter (7 Harley-Davidson) ... 80s.
- Time, 9m. 10 $\frac{1}{2}$ s. 52.3 m.p.h. Won easily.

SIDECAR HANDICAP (FIVE MILES).

1. H. Jones (7 Harley-Davidson) 25s.
 2. R. L. Kennett (7 Harley-Davidson) ... scr.
- Time, 6m. 23s. 47 m.p.h.

An interesting event was a race between R. Crawley (7 Harley-Davidson) and J. Mercer (100 h.p. biplane). The course was five miles, each competitor making a flying start. The airman flew round the course at a height of about 500 feet, but had some difficulty in keeping to the line of the track. Crawley was an easy winner by fifty yards. The time is not available.

THE RICHMOND MEET.

Revival of the Annual Yorkshire Intermeeting of Motor Cycle Clubs.

Members of the Middlesbrough Motor Cycle Club, one of the several clubs at the Richmond Meet.

TO mark the opening of the summer season in pre-war days the North of England clubs held an intermeet at Richmond, which was always well attended. This year's event, however, only attracted some seventy motor cyclists, which comparatively low number is accounted for in various ways. In the first place, a large number of club members have not yet taken delivery of their machines, and many others who were more fortunate took advantage of the holiday to go touring.

However, despite the presence of threatening clouds early in the day, which induced several to don "oilies" in preparation, members of the Middlesbrough, York, and Harrogate Clubs started for the venue, and by devious paths reached Richmond, which the first-comers found very quiet.

As at every motor cyclists' rendezvous, great interest was displayed in new machines, but except for a few new Triumphs, B.S.A.'s, and a P. and M., no post-war models were on view. The only light car in evidence was a smart Singer, which had 8,000 miles to its credit, and a few Morgans represented the cycle cars.

Only one lady driver was seen, and she was on an old twin Peugeot with sidecar, which was driven from Middlesbrough.

Mr. J. Stevenson arrived from Darlington with a 1913 6 h.p. Clyno outfit carrying no fewer than five passengers—a load which he says the machine is easily capable of carrying. An old lightweight

F.N. with a passenger on the carrier was noticed.

The event this year proved to be a very pleasant affair, but future Richmond rallies no doubt will be more like those of pre-war days, when the secretaries of Northern clubs met to discuss summer programmes, and to arrange inter-club runs, and motor cyclists turned up in their hundreds.

(Left) R. T. Cawthorne, a north-country rider, on a smart Dot outfit. (Right) J. Butler on his 3½ h.p. Scott sidecar.

DUBLIN RELIABILITY TRIAL.

THE Easter trial of the Dublin and District Motor Cycle Club attracted a very good entry, despite the fact that the great majority of those who took part in the event were mounted on machines that in pre-war days would have been regarded as being past service for such strenuous work as Irish trials usually prove. The certainty that this would be the case doubtless weighed with the committee in fixing the course, as Dublin to Dundalk, by Ashbourne,

Collon, and Slane, and back by Dunleer, Drogheda, and Balbriggan, would not have been regarded as a severe test in the early days of the pastime. The route of approximately one hundred miles ended at Drumcondra.

Of the 26 entries received, 19 started.

Despite the easy nature of the course, only two-thirds of the starters completed the journey. One secret check was taken, and the variation thereat decided the result of the competition.

The results were as follow: 1, A. Grimes (7 Indian sc.), 31s. variation; 2 and 3 tied, T. Redmond (7 Indian sc.) and J. Adair (2½ New Hudson), 34s.; 4, A. Carton (7 Indian sc.), 38s.; 5, R. Hewison (7 Excelsior sc.), 57s.; 6, D. Allen (2½ Allon), 64s.; 7, R. Clarke (7 Excelsior sc.), 69s.; 8, P. H. Hurse (4¼ B.S.A.), 84s.; 9, M. McLoughlan (3½ Norton), 88s.; 10, T. Carton (2¾ Douglas), 89s.; 11, R. Armstrong (6 Enfield sc.), 94s.; 12, F. McMullen (3½ Rndge), 144s.

A 3½ h.p. Spring Frame Douglas for 1919.

New Design Spring Frame embodying Enclosed Coil Springs.

The new 3½ h.p. Douglas, which is fitted with a spring frame. The flat twin engine has cylinders 68 × 68 mm. = 494 c.c.

WORLD-WIDE is the reputation enjoyed by Messrs. Douglas Motors, Ltd., of Bristol, the pioneers of the flat twin. A general engineering business, with a speciality in boot and shoe machinery, and an intelligent anticipation of the motor cycle needs of the public in taking up a small flat twin lightweight proved to be the foundation of the present important branch of the motor cycle industry. Then followed a remarkable run of success in competition on road and track, culminating in a still more notable success on war service on all fronts. Such in brief is a summary of the qualifications and experience behind this latest production, the 3½ h.p. Douglas.

1919 is in fact a complete redesign in every part. New as it is to the ordinary rider, the firm have subjected the model to extensive road tests during many months, and now offer the 3½ h.p. as a proved design, representing the result of their accumulated and unique experience.

The Engine Unit.

The volume swept by the pistons is a shade under 500 c.c., each cylinder being 68 × 68 mm., and it is to be nominated 3½ h.p., but, of course, develops more. The valves, inclined side by side on the right hand of the unit (differing from the 4 h.p. models, which are on top), are operated through links by single cam wheel, one cam lifting the exhaust valves and the other actuating the two

inlet valves. An intermediate wheel carries a worm driving, at right angles, a small rotary lubricating pump running at one-twentieth engine speed, situated on the side of the crank case near the top, thus admitting of very short oil pipes being used.

A hand pump and sight feed is interconnected with the rotary pump, and one lead only is given, that being to the front cylinder.

The magneto pinion wheel, independently mounted, drives the magneto by a single dog; removal is facilitated without disturbing the timing, and it is impossible to replace the magneto incorrectly.

It is interesting to observe the position adopted for the plug, i.e., between the inlet valve and cylinder head.

A redesigned spring fork
Note the substantial lamp bracket.

It is extraordinary how, in the early days, environment considerably affected the design of motor cycles. In this connection the firm claim that their factory, situated as it is in the hilly West, gives them a considerable advantage over many other manufacturers in the matter of testing. They argue that if a motor cycle will give efficient service in the West Country it may be relied upon to do so anywhere, and many who know the Bristol district well will agree.

Though retaining the general Douglas outlines, the 3½ h.p. model introduced for

The engine unit with timing cover removed to show the method of withdrawing the shaft of the oil pump.

(Left) Clutch operating mechanism. The arrow points to the adjusting ratchet lever. (Right) By removing two nuts the chain cover is detached; the centre portion of the domed clutch cover gives access to the operating mechanism.

The cylinders differ slightly from former models, the horizontal fins tapering towards the base, whilst unusually large cylinder ports are provided. The extent of the offset is not so pronounced as hitherto, a little wider offset at the small end of the connecting rods being necessitated thereby.

Douglas standard type pistons are employed with two top rings only. On the lower edge of the lower groove a bevel is formed, through which is drilled

small flanges to retain the rollers, a depression being provided on the rod to assist assembly; the addition of loose flanges is thus obviated. Balance weights are fitted and absolute tightness is ensured by wedging surfaces and one bolt in each web. The main bearings may be either ball or roller, provision being made for either type.

Concentric aluminium fins are fitted to

the valve caps to assist cooling, and very light, easily adjustable tappets are another good point.

An Amac carburettor of the type favoured by this firm, i.e., with exhaust jacketed vaporising chamber, is coupled up to external induction pipes; the incorporation of an induction chamber in the timing case was made the subject of experiment, but did not offer advantages to balance the increased cost of produc-

(Left) A standard type of piston. Note small drilled holes on the bevelled edge of the lower groove.

(Right) Gudgeon pin fixing. A domed copper cap is placed in the hole and expanded into the groove by pressure. The cap on one side has a central hole through which to insert a rod when removing the cap on the opposite side.

a number of small oil holes leading to the interior of the piston. The interior of the piston is webbed.

Main shaft and connecting rods form a very neat item; the roller bearing big ends are ingeniously constructed with

The magneto is removed by detaching two nuts on a bridge member which releases a horseshoe distance piece. The magneto can be lifted out without disturbing the timing.

The valve caps have two concentric aluminium fins to assist cooling

tion. Perhaps the most unique point of this newly designed engine is its mode of attachment at three points only, two lower frame bolts and one upper bolt connecting the magneto holding-down bridge to the centre of the under tank tube. The advantage lies in the fact that the whole engine unit can be taken out of the frame in less time than it takes to remove a cylinder from the average single-cylinder engine.

The method of securing the magneto is quite new. A horseshoe bridge with a distance piece binds it firmly on the

(Left) Plan view of the new Douglas (Right) Underneath view of the machine, showing ample size of the undershield.

A 3½ h.p. Spring Frame Douglas for 1919.—

top of the crank case, and also represents the third point of engine attachment just mentioned. Each of the three nuts is instantly accessible.

Provision is made for the installation of a Lucas lighting dynamo, the drive being taken from the magneto pinion; a new timing case cover and magneto bridge are necessary with an extension to cover the dynamo drive. This item forms an extra to the standard specification.

Combined chain and belt transmission is still used, not without due consideration of the claims of chain, belt, or shaft drive. A Renold $\frac{1}{2}$ in. \times $\frac{5}{16}$ in. pitch chain is employed between engine and countershaft, the enclosing chain case being oil tight, yet very easily detachable; whilst both chain and clutch run in an oil bath.

Countershaft Three-speed Gear.

The ratios adopted are: Top gear 5.1 to 1, middle 7.8 to 1, and low 11.9 to 1. The gear has been completely redesigned, but on the same principles as that

The connecting rod, showing small flanges for retaining the rollers of the big end bearings.

formerly fitted on Douglas models; the chief innovations are the clutch and enclosed kick starter. The clutch is of the cone type, cast iron to mild steel, running on a ball bearing. The chain wheel carries six cone taper surfaces, three on each side, engaging with corresponding surfaces on the inner and outer plates, whilst each face has oil conveying grooves formed upon it. A 50 lb. double central helical spring engages with three radial

Crankshaft, showing one loose balance weight. Its final position is indicated by the dotted line.

levers on a floating ring; these provide a 3 to 1 leverage, and the operating mechanism provides a 4 to 1 leverage, thus giving very easy control. No tools are necessary for adjustment, a ratchet lever, operated by hand, remaining *in situ* on the clutch. The domed cover and

The metal undershield and flexible leather leg shields. The latter can be quickly removed and rolled up when not required.

the gear box casting are in aluminium with dull smooth finish. The combined attachment for the clutch control lever and exhaust lifter to the handle-bar is particularly neat. The final drive is by a $\frac{1}{2}$ in. belt, which is protected by a metal shield.

The New Spring Frame.

Steel lugs are employed, bored from the solid stampings, the head being a particularly strong point. The Douglas spring frame, which we have previously noted as a patent, is a complete departure from their former practice, laminated springs being abandoned in favour of helical springs. The rear frame is pivoted behind the gear box bracket on a very wide, hardened and ground plain bearing; the upper point is connected through an ingenious pair of levers, whose function is to reduce movement, to a pair of enclosed helical springs placed horizontally on each side of the saddle lug. These springs (each being made up of two concentric springs) act in compression, and adjustment is provided to suit different riders' weights. Approximately, $\frac{3}{4}$ in. movement of the wheel is reduced to about $\frac{1}{4}$ in. on the springs. The carrier is sprung with the frame. Means of lubri-

cating all moving parts are provided. For three years this spring frame has been under test by the Douglas firm, and so satisfactory is it in the comfort provided, hard wearing capabilities, and absence of lateral movement, that it takes a definite place in their future programme. Wheels and tyres are 26 in. \times 2½ in.

Mudguarding.

Special consideration has been given to mudguarding. There are deep valances on wide guards to both wheels, a substantial undershield with side valances fitting to the inner edge of the footboard, and, if required, flexible leg shields attached to a cross bar on the top tube. This cross bar is only dropped on, no fastening, the shields being buttoned down tightly to the front flange of the undershield.

The rear brake operates on the belt rim from a right pedal through a compensating lever, whilst the front brake is of the

The rotary oil pump and driving shaft.

conventional stirrup type. The saddle is fixed to the frame, adjustment for riding position being at the footboards.

The new tank, a variation of the 4 h.p. type, has a petrol capacity of one gallon five pints, and of lubricating oil two and three-quarter pints. The gear control lever is in the usual Douglas position over the tank, and the vertical control rod passes through the tank.

As a solo mount with empty tank the machine scales 231 lb.

We hope shortly to avail ourselves of a proffered trial of one of these new 3½ h.p. machines, which, combined with a re-designed 2½ h.p. lightweight and the 4 h.p. sidecar model, will form the Douglas range in 1919.

Valve side of the 3½ h.p. Douglas. The weight of the machine is 231 lb., and petrol capacity 1 gall. 5 pints.

AUTO CYCLE UNION NOTES.

(Officially communicated.)

SECOND-HAND MOTOR CYCLES.—The Auto Cycle Union has been busily engaged recently in advising members in buying second-hand machines.

A MOTOR CYCLISTS' MEMORIAL.—A committee has been formed by the Auto Cycle Union to look into the matter of a permanent memorial to the services rendered by motor cyclists during the war.

A COMMEMORATION OF MOTOR CYCLISTS.—On the suggestion of the Rev. E. P. Greenhill, the Auto Cycle Union is to take steps to arrange a commemoration service to the memory of members who have fallen in the war.

FORTHCOMING A.C.U. MEETINGS.—The Auto Cycle Union has arranged the following dates and venues for forthcoming

meetings of the General Committee: June 20th, Bristol; September, headquarters of Six Days Trial; November 28th, London (during the motor cycle exhibition); February 20th, 1920, Manchester.

NEW MEMBERS.—Despite recent extension, the Auto Cycle Union is having to consider the advisability of still further enlarging the premises at headquarters.

Times to Light Lamps.

SUMMER TIME.

May 1st	8.50 p.m.
" 3rd	8.54 "
" 5th	8.57 "
" 7th	8.59 "

The Six Days Trial.

It is practically certain that the A.C.U. Six Days will be held in September.

Dutch Show.

There is to be a car and motor cycle exhibition in Amsterdam in July next.

Imports Restricted.

The Board of Trade announce that ball bearings, roller bearings, ball retainers, ball bearing bolts, and steel balls may be imported only under limited licences.

"The First 100,000."

This issue of *The Motor Cycle* sets up a new world's record in the circulation of motoring journals, the printing order exceeding 100,000 copies.

Lecture on Benzole.

The Liverpool Motor Club has arranged a lecture to be held at the small Picton Lecture Hall on the 5th inst. at 7.30 p.m. The lecturer will be Mr. S. Henshaw, of the Staffordshire Chemical Co., one of the best authorities on this subject. Mr. T. W. Loughborough, A.M.I.A.E., secretary of the A.C.U., has promised to be present.

Trade Control Abolished.

The Board of Trade announced last week that, with a few exceptions, all controls on the sale and distribution of commodities exercised by the War Office, Admiralty, Ministry of Munitions, and Board of Trade have been abolished, or will cease at the latest by May 31st. This opens the way to a great trade revival.

Results of Cork Trial.

First-class awards (marks lost given in parentheses): E. B. Russell, 4 Triumph (1), G. H. Ogilvie, 4 Triumph (2), T. R. Popham, 6 Enfield sc. (2), J. Gibbings, 4½ B.S.A. (3), J. P. Frost, 6 Enfield sc. (3), W. Waterman, 7 Indian (6), S. R. Hasford, 3½ Zenith (6). Second-class awards: J. Atkinson (5-6 Ariel), J. Ryan (2½ A.J.S.), J. A. Wilson (3½ Rover). Third-class awards: W. J. Musgrave (4 Triumph sc.). Special awards: Best performance, E. B. Russell; sidecar prize, T. R. Popham; novices' prize, T. R. Popham; sidecar prize under 600 c.c., W. J. Musgrave; beginners' prize, J. H. Watson.

The Institution of Automobile Engineers.

The eleventh meeting of the session of the Institution of Automobile Engineers will be held on Wednesday, the 7th inst., at the Royal Society of Arts, John Street, Adelphi, W.C., at 8 p.m., when Mr. Chas. Day will read a paper on "Diesel Engines." Cards of invitation to the meeting may be obtained by those interested in the subject on application to the Secretary of the Institution of Automobile Engineers, 28, Victoria Street, London, S.W.1. A further meeting will also be held at the Chamber of Commerce Hall, New Street, Birmingham, on Thursday, the 8th inst., at 7.30 p.m., when Mr. E. Tilston will read a paper entitled "Two-stroke Engines for Motor Cycles."

The Winner of the Victory Cup.

To Mr. Gus Kuhn, of S. Yardley, Birmingham, is due the honour of winning the premier award in the first British post-war open trial. His performance was a remarkably good one, especially as the mount upon which he won the Victory and Evans cups was a lightweight, to wit a 2½ h.p. Levis.

The particular Levis upon which he won the Victory cup is a comparatively old machine, being a well-worn 1914-1915 model with Enfield gear (ratios 5½ and 10½ to 1), Amac carburetter, and Hutchinson 26in. x 2in. tyres. Mr. Kuhn tells us that his average consumption is about 125 m.p.g., and that his maximum speed is about 40 m.p.h.

Special Features.

THE VICTORY CUP.

HILLS ON WHICH I HAVE FAILED.
NEW MODELS.

A.C.U. Committees.

The following are elected to serve on the Competitions Sub-committee of the A.C.U.: Messrs. E. B. Ware, A. V. Ebbelwhite, F. A. Hardy, Alec Ross, J. W. G. Brooker, Maj. A. M. Low, R.A.F., the Rev. E. P. Greenhill, Col. A. E. Davidson, D.S.O., R.E., Maj. W. G. McMinnies, R.A.F., Col. D. F. Nicholl, D.S.O., R.A., Messrs. W. Cooper and A. G. Reynolds.

The Touring Sub-committee consists of Messrs. H. P. E. Harding, H. G. Bell, E. M. P. Boileau, J. W. G. Brooker, B. Mariani, Maj. W. G. McMinnies, Mr. W. H. Wells, Maj. J. R. Potter, Mr. L. Wozencroft, Maj. S. R. Axford, Messrs. F. Murray and S. L. Bailey.

Mr. Gus Kuhn (No. 25), the winner of the Victory and Evans cups in the Victory Cup Trial, mounted on the 2½ h.p. Levis, with which he secured the awards. The weight of the machine is sufficiently light to permit of its being lifted by its rider. Petrol consumption equals 125 m.p.g.

A 1915 4 h.p. Triumph and Gloria sidecar, awarded the prize given for the best appearance at the N.M.C.F.U. Rally.

On Birdlip.

A small dog persisted in trotting across Birdlip in front of almost every competitor during the Victory Cup Trial, and its owner did not seem to realise the number of times her pet narrowly escaped sudden death.

Demand for 1,500,000 Motor Cycles.

According to an American paper, Mr. Duncan Watson, M.I.E.E., the managing director of the British Harley-Davidson Co., is credited with having stated that the British post-war demand for motor cycles will not be satisfied until a million and a half motor cycles are produced.

French Motor Cycles.

An interesting article on the French view of the motor cycle position in France appeared in a recent issue of *L'Auto*. The article generously gives England the credit for being the leader in the world of motor cycle construction. It points out how, in years gone by, French manufacturers were afraid of launching forth into the motor cycle market, and contented themselves with delivering cheap machines, clearly inferior to those manufactured by their British neighbours. It was shown that the motor cycle, far from being a vehicle purely for sport and luxury, became of prior utility during the war and was employed on a large scale by the English, Americans, and French. At the present time several of the French aeroplane manufacturers are devoting their attention to and are using their factories for the production of motor cycles of first rank, machines which our contemporary says will be capable of combating foreign competition. Not much can be done at the moment, but a few months hence it is anticipated that the factories will be turning out machines of a quality even better than expected. It is reported that M. Georges Levi, a manufacturer of seaplanes, is about to devote his factory and technical departments at Levallois to the manufacture of high grade motor cycles.

Good Spare Parts.

A question in the House of Commons the other day elicited the fact that the Government has £15,000,000 worth of spare parts and accessories for all types of motor vehicles, half of which are in this country. Such as are surplus are to be sold.

New French Models.

THE 1919 GRIFFON.—The makers of the Griffon—The Société Anonyme des Cycles Griffon, 40, Rue Louis-Blanc, Courbevoie, Seine—are concentrating on a single model: 6 h.p. twin-cylinder, 74 mm. x 87 mm., to be provided with two-speed gear box and clutch controllable either by foot or hand, while the gears will be changed from the handle-bars. Price £96; coach-built sidecar, £28 extra.

THE 1919 CLEMENT.—Manufactured by Cycles Clément, 76, Grande Rue, Pré-Saint-Gervais, Seine. This firm is also concentrating on a single model: 4 h.p. twin-cylinder, V type, 64 mm. x 77 mm., two speeds and clutch, automatic lubrication, at £120.

The obvious advantage of the sidecar over any other type of light motor vehicle, so far as passenger accommodation goes, is well exemplified during the week ends. Sidecar outfits with four up are a common sight. The owner of the Clyno shown above appears to have solved the problem of carrying a family of six in a quite satisfactory manner.

Cognoscenti on the Saddle.

Among the machines on the Ripley Road last week-end were noticed a new Wooler, a twin Blackburne, a 1919 T.T. Rudge with handle-bars almost meeting the footrests, a gigantic J.A.P. in a light frame evidently home assembled, one of the latest T.T. electrically-equipped Harleys purring along at an easy 40, and a four-cylinder Henderson solo. Two-strokes were greatly in evidence, as was the ubiquitous Douglas.

Sir Douglas Haig and the Signal Service.

The close touch that this journal kept with the motor cyclists in the Signal Service (R.E.) throughout the war renders Sir Douglas Haig's remarks regarding army motor cyclists of especial interest to our readers. From the very moment hostilities broke out the staff of this journal were busily engaged in helping the Government in every possible way in obtaining suitable recruits for this important branch of the service. In contrast to Lord French, Sir Douglas Haig refers to the motor cyclists as such. It may be recollected that in Lord French's first despatch he unfortunately referred to them as "cyclists," consequently a good deal of the honour due to these brave pioneers was lost to them.

Sir Douglas Haig's report is his last and deals with the advance into Germany from November 11th, 1918, until December 31st of that year. The report reads: "On the advance of our forces to the Rhine, telephone communication was established between General Headquarters at Montreuil and Cologne. Signal communication entailing the putting up of many thousands of miles of wire was provided also for the control of railway traffic, while to supplement electric communication generally a Despatch Rider Letter Service was maintained by motor cyclists. The amount of signal traffic dealt with became very great and on the lines of communication alone more than 23,000 telegrams have been transmitted in 24 hours. Similarly, at the General Headquarters, as many as 9,000 telegrams have been dealt with in 24 hours, besides 3,400 letters carried by despatch riders."

A New Lightweight on Standard Lines.

The Carfield Two-stroke embodying Well-known Components.

The 2½ h.p. Carfield two-stroke. The engine is a 2½ h.p. Villiers and the gear a two-speed Albion.

CONSIDERING the demand existing for motor cycles at the present time, it is perhaps surprising that more new firms have not come into existence to take advantage of the popularity of the motor cycle. In the car world upwards of thirty new motor firms have entered the industry, and, although the

call for motor cycles is even greater than for cars, only a few newcomers have been recorded.

One of these is the Carfield Motor Cycle Co., of Smethwick, Birmingham, which, though handicapped by inadequate temporary premises, has made a good start with a two-speed two-stroke light-

weight on the usual standard lines. It has a strongly built frame, particularly strengthened at the head, designed to accommodate the well-known 2½ h.p. Villiers two-stroke engine unit, with a standard Amac carburetter and a C.A.V. magneto.

The drive is taken through a Brampton ½ in. × ⅝ in. chain to an Albion countershaft two-speed gear box, of standard pattern.

The drive to the rear wheel is by Dunlop ⅝ in. belt, and the 26 in. wheels, which are finished all black, are shod with 2 in. Dunlop rubber-studded tyres. Ample wide mudguards and a very substantial carrier are special features, the latter incorporating two metal-cased toolbags. The rear brake is heel-operated, acting upon the inner side of the belt rim.

The other points of the specification are: Lycett's pan saddle, semi T.T. bars, and Best and Lloyd sight drip-feed lubricator. A well-formed tank carries one and a quarter gallons of petrol and a quart of oil. The filler caps are of large size.

Production commenced a few weeks ago, and several Midland agents have machines in stock, the selling price being £51.

A SPANISH MOTOR CYCLE.

A SPANISH reader who is a motor mechanic, and has served with the Hispano-Suiza and other important motor firms in Spain, evidently is not content to import "foreign" motor cycles, and has completed a single-cylinder motor cycle, which has attained a speed of 64 m.p.h.

This engine has a bore and stroke of 85 mm., overhead valves, and is fitted with the builder's own carburetter, which, like the machine, he is calling the Cacharo, his own name.

A cone clutch and expanding pulley gear are operated by a long lever on American lines.

Señor Cacharo also built a two-cylinder machine with a 760 c.c. engine about two years ago, which, the designer claims, was the first motor cycle to be constructed in Spain.

Spain is rapidly coming to the fore as a motor cycling country, and, taken generally, the Spaniard is a keen sportsman, as witness the motor cycle events frequently reported in *The Motor Cycle*.

A twin sidecar outfit designed and built by Señor A. Cacharo two years ago.

INTERNATIONAL MOTOR CONGRESS.

AT a recent meeting in Paris of the International Motor Congress, when the automobile industries of Belgium, France, Great Britain, Italy, and the United States were represented, the following resolution was carried:

"In view of the production during the present war by the automobile industries of the Allied countries of war material

of all kinds, and of the services rendered by automobile transport of the highest importance to the armies, and in view of the fact that motor transport of passengers and goods is now an indispensable condition in modern life, and that motor transport generally has ceased to be a luxury, and has become a necessity of commerce, the Congress recom-

mends that the internal taxes and duties of all kinds, direct and indirect, which fall heavily on automobilism in most of the Allied countries, be largely diminished in order to permit normal and progressive development of automobile communications; and that the product of these taxes and duties be applied to the upkeep and improvement of the roads."

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

SINGLE-CYLINDER BALANCE.

Sir,—I am much interested in single-cylinder balance, and I may tell you that I am preparing a 370 c.c. single, which is better balanced than a modern flat twin, and its weight will be a little under 30 lb. Its fuel economy and m.e.p. will also be a little better than usual. The bore is 54 mm. and stroke 162 mm.

HUGO MOREN.

Rasunda, Sweden.

[A balancing device for single-cylinder engines, patented by Mr. Moren, was illustrated in *The Motor Cycle* of March 27th, page 296.—Ed.]

ROUGH TREATMENT FINELY WITHSTOOD.

Sir,—It may interest you to hear of the gruelling to which a friend and I subjected a 1914 6 h.p. A.J.S. and new Mills-Fulford sidecar in an attempt to reach a club meet at Moel Famman on Easter Monday.

Starting the climb from the Ruthin side, instead of, as we afterwards learned, from Mold, we kept climbing, under the impression everyone else was ahead. The "path," as you probably know, is simply indescribable, and the gradient in places—! To put it shortly, we reached the top, much to our own and several pedestrians' surprise. On regaining the main road, my friend took control, but within a few hundred yards the front wheel skidded on some loose stones, and, owing to an old wound, he was unable to straighten out, and we charged the right bank at speed. The whole outfit made two complete side somersaults, my friend underneath! On picking ourselves up, we found a cut on his leg the only casualty between us, whilst a very slight buckle in the sidecar wheel, a burst tube, and small dent in the top of the head lamp were the only damage. I really think all credit should be given to the makers for turning out work which will stand this treatment.

I have no connection with either of the firms mentioned.

J. W. WILLS.

ONE-LEGGED RIDERS.

Sir,—At the present moment there are many men who have lost the use of a leg, and who look to the motor cycle combination to solve the serious difficulties which arise in the matter of locomotion.

Being one of those who have lost the use of a left leg, I started some time ago to search the makers' advertisements in your paper to try and decide which make of cycle to purchase. Not finding the particulars I wished, I was compelled to write to various makers, asking them for particulars as to controls, etc., explaining that it was essential that the cycle should be manageable without having to use the left foot. In two instances I received courteous replies, in the remainder either no reply at all or else an advertising circular which carefully omitted the points I wished to ascertain.

Would it not be to the makers' advantage, at this present time, to give fuller details of their post-war models, of which, in the main, we are entirely ignorant? Alternatively, would it not be to their advantage to court the custom of a large body of men, of whom I happen to be one, by showing ordinary civility and consideration to them as potential buyers?

I have noticed the previous correspondence in your columns on this subject, which appears to have left the makers cold. Why do they not advertise "suitable for rider with right leg only," etc.?

GAMMY-LEG.

London.

COURTESY ON THE ROAD.

Sir,—I am always interested in "Letters to the Editor" appearing each week, and would like to ask you if you would put in one of your future numbers an appeal to the newer riders who are just taking up motor cycling to cultivate the old-time courtesy and chivalry which have so long existed on the road and always have been such a boon to anyone when in trouble on the roadside. I have been riding some years now, both a push bicycle and motor cycle, and have received help and advice, and returned them many times, until Easter Monday, April 21st.

I was travelling between Desborough and Birmingham, and after getting a few miles out of Market Harborough I picked up a wire nail about 2in. long. The result, rather a bad puncture. I pushed the sidecar right on to the turf on the roadside, and jacked up the cycle on the stand, which was just on the road. I then saw a steam tractor coming from Lutterworth way, and a motor cycle and sidecar from Market Harborough way. They came together just opposite me, and although there was room to pass the driver of the sidecar came so close in that he bumped my machine, spinning the number plate and rear lamp right up in the air, split the mudguard, and also dented it right across. I quite understand it was an accident, but he did not stop, although I heard the lady passenger remonstrating with him.

However, I do not want to make this a personal matter, but I am afraid that, without this old-time courtesy the open road will lose a lot of its charm.

C. J. WILLIAMS.

OBTURATOR RINGS.

Sir,—In view of the remarks made on this subject by a correspondent in your issue of April 24th, I should like to say that, as one who has been intimately connected with the use of these rings during the war, I can scarcely endorse the opinions expressed.

As far as can be seen they were introduced in order to permit steel cylinders having very thin walls to be used without cast iron liners. Any slight distortion of these air-cooled cylinders was compensated for by the elastic action of the obturators. Over and above this feature, however, it is difficult to see what advantage they offer. Piston rings have in all cases to be fitted in addition, in order to obviate excessive loss of oil out of the exhaust.

Replying to the points raised by your correspondent, I may say that, in my experience of hundreds of Clerget and Mono type engines fitted with obturators of all manufactures, the average life of a ring has been under fifty hours' running.

Taking the high cost of the rings into consideration, it is evident that, as a commercial proposition, they stand at a disadvantage as compared with the cheap, efficient, and robust step-cut piston ring.

Your correspondent's remark about piston rings being inefficient because the gases imprisoned behind them cause additional friction is rather curious, since it is just this property that causes the obturator to wear so quickly, while the piston ring remains practically unaffected.

In the latest rotary engines (B.R. type) the troublesome obturator has been abolished altogether in favour of the piston ring, on the lines of the Le Rhône, which has always been a favourite for this very reason.

I should be very glad to hear of anyone who is sorry to see the decadence of the obturator ring, excepting, of course, those interested in its manufacture.

London.

MOVIL.

LOOSE CRANKSHAFT.

Sir,—May I thank those motor cyclists who spent some time endeavouring to get my Scott motor cycle to start at the Wisley Hut a short time ago.

After trying every means it had to be towed home, and no doubt the reason of it not starting will be of interest.

The crankshafts had become loose on the flywheel, and instead of one piston being at the top and one at the bottom of the cylinders they both came to the top together. This, of course, would not allow any firing. E. LANGFORD.

A TABLOID HISTORY OF AIR-COOLING.

Sir,—“Pitot’s” letter on page 398 of *The Motor Cycle* for April 17th is simply potted nonsense. I do not want to be severe, but people should not rush into print without obtaining at least passable authority for their facts. So far from rotaries being more economical in fuel than stationaries of corresponding horse-power, they consume about one-tenth of a pint more per b.h.p. To put this more definitely, a 100 h.p. rotary uses approximately one gallon more fuel per hour than a 100 h.p. stationary; a 250 h.p. rotary uses two gallons more than a 250 h.p. stationary. “Pitot” utterly ignores the question of horse-power in his letter: he does not mention what sizes of rotaries and stationaries he is thinking of, and so tumbles into some such pitfall as comparing an 80 h.p. Gnome with a 400 h.p. Liberty, which is absurd.

He is also quite wrong about radials being “unproved.” He is evidently wholly unaware of the R.A.F. programme for 1919, though it has long been an open secret in the trade. He is, presumably, equally ignorant of the facts on which that programme was founded.

I give “Revs” up as a bad job on the “lost prop” question, after suggesting to him the Socratic method of arriving at truth.

In his opinion,

1. Does a lost prop remain stationary during a dive at 100 m.p.h. A.S.?
2. If so, why?
3. Failing (1), does a lost prop revolve backwards during a 100 m.p.h. dive?
4. If so, why?
5. Failing (3), does a lost prop revolve forwards during a 100 m.p.h. dive?
6. If so, what arbitrary factor prevents the engine from restarting?

TORQUE.

Sir,—The contention put forward by “Pitot” in the issue of April 17th would carry more weight if he had given more accurate figures in support of his case.

While admittedly wasteful in oil consumption, he does not consider rotary engines to be correctly stated to be wasteful of petrol. He mentions two rotaries by name, saying nothing of their horse-power, and compares their petrol consumption in gallons per hour with that of some unspecified stationaries.

The comparison as stated by him is absurd. If he can produce duly authenticated figures to show that the petrol consumption in pints per b.h.p. hour (the only comparative units) of a rotary is less than that of a decent radial (for naturally only air-cooled engines can be considered in this

connection), I will withdraw my statement that “Road Rider” was correct in maintaining a rotary to be wasteful of petrol as well as oil.

It seems to me that the rotary was doomed as anything but an historical war-time make-shift the minute the palm for low weight for power was allowed to fall into the hands of the radial. REV.S.

IN THE FUEL WORLD.

Sir,—With reference to an article entitled “In the Fuel World,” published in *The Motor Cycle* of April 10th, I call to mind an analytical chemist’s discovery of a process by which alcohol could be extracted from beer (without affecting in any way the medicinal qualities or constitution of this drink) in sufficient quantities as to be able to place methylated or benzolised alcohol on the market as cheaply as, if not cheaper than, petrol. In the process of de-alcoholising beer, alcohol becomes merely a cheap by-product.

I am acquainted with the inventor, and know the struggle he has had, for ten years, with the Excise authorities, to be allowed to exploit his invention, but in vain. He was allowed to patent his process, had the trouble and expense of erecting a factory, etc., and then was forbidden to manufacture de-alcoholised beer, even in the smallest quantities. After a long battle with the Excise, he took his process to the United States of America. Here it was received, literally, “with open arms.” The Government of the U.S.A. at once altered the whole law of the country to meet this one patent alone with their (originally British and antiquated) Excise laws. It has been forcibly put before our Parliament, but Messrs. Dilly and Dally of the Excise authorities are inexorable, and as a consequence the poor motorist has to suffer. A.M.J. INST. ENG.

Newark.

IN STOCK.

Sir,—I am very glad to see this question has been put before you and to read your correspondent’s remarks.

Recently I saw two advertisements for “1919 models in stock” of a certain make I am anxious to obtain, but on telephoning the advertisers I was told, in each case, that the motor cycles had been sold the day before the advertisement appeared. One firm said it would be pleased to book my order and would give me delivery in six weeks’ time! This firm’s advertisement appeared again in *The Motor Cycle* for April 17th.

There is also a firm who advertises regularly certain accessories in stock. I have for several weeks now communicated with it, but I am always told “Nothing at the moment, but deliveries are expected in any time now, probably this afternoon.” When I called on the firm two or three weeks ago I asked why it advertised articles as being in stock when they had nothing to offer, and they told me it was “not their fault if the goods had been sold after the advertisement was in the printer’s hands”; but the advertisement still goes on in various papers week by week. I was told that if I would leave a deposit the firm would supply what I required in strict rotation, and showed me copies of several receipts for deposits on orders placed that morning.

East Sheen.

X.Y.Z.

A fair number of members of the Newcastle and District Motor Club turned up on Good Friday for the opening run to Allendale. Powerful sidecar outfits predominated, one of the smartest being a new A.J.S. (on right) owned by the trials secretary.

HORSE-POWER RATING.

Sir,—Surely it is now time something was done to abolish the present haphazard and often deceptive method of rating the horse-power of engines. This is especially noticed among the small two-strokes, all sorts of different bores and strokes claiming to be $2\frac{1}{2}$ h.p. Would it not be possible to get makers to agree to a fixed ruling? I would suggest 100 c.c. per h.p. Then the capacity or h.p. could be read at a glance, i.e., 350 c.c. would be 3.5 h.p. and 270 c.c. 2.7 h.p., etc., and everybody would know what was being offered him. The rating suggested would come well within the actual h.p. developed.

P.R.A.

London.

[This suggestion has already been made in *The Motor Cycle* more than once.—Ed.]

PULLEY GRIP.

Sir,—We were interested in "Graduate's" and R. L. Boyd's letter on this subject, and would like to make it clear that the belt does actually pull the pulley flange inwards (due to the curved slot), but it must be borne in mind that the pull is also re-acted upon by the load on the engine, and we have found in practice that there is a balance formed between the two pressures. The reason we have put a ball thrust on the inner side is that we find that many riders use the belt much too short to allow of the higher gears being used without forcing the pulley inwards with unnecessary pressure. Hence the necessity for a ball thrust.

GRADO, LTD.

Sir,—In reply to Mr. Boyd's letter *re* the Grado Gear, I beg to state that the gear does not work satisfactorily with a Whittle belt. This is owing to the lack of friction between cast iron and leather, also the tendency of the leather belt to glaze when running with cast iron.

The pulley depends upon the surface grip on the metal for its satisfactory action on the low gear; and with a rubber belt the low gears work well.

I have run a Grado for some time, and have effected a vast improvement by fitting a ball thrust between the collar and loose pulley side, also in fitting a hardened steel roller on a pin working in the special slot in the pulley boss.

H. W. TATTERSFIELD.

A STATIONARY PROP.

Sir,—In view of the recent discussion in *The Motor Cycle* about losing one's prop., the enclosed photograph may be of sufficient interest for reproduction in your paper. The photograph, which I took from the front seat of a BE2e, shows the propeller absolutely stationary. The height was 4,000 feet. There was no difficulty in starting the engine, an eight-cylinder stationary R.A.F., after quite a short dive.

I have more than once been a passenger in a BE2e when my pilot has purposely "lost his prop." On no occasion was there any difficulty in starting the engine by diving.

London.

STALL.

**THE NEW A.B.C.**

Sir,—I should like to thank Mr. Bradshaw for the able way he has replied to my criticisms, but I cannot agree with him on all points.

He says it is the old question of accessibility, reliability, etc., where the design calls for sacrificing one for another. I am sorry to think with regard to accessibility combined with neatness that he is not much nearer solving this question than designers did in 1910.

I should like to say that I rode a motor cycle before that year which was as near my ideal (except the springing) as machines are to-day, and it did not have a gear box hung on to the bottom bracket with clutches, etc., sticking out (quoting Mr. Bradshaw's words), but it had three speeds and a clutch which were entirely satisfactory—silent, neat, and clean.

I think that accessibility and neatness have been sacrificed (as far as one can judge by diagrams) because even if the whole unit can be taken out with one spanner and a pair of pliers it does not mean to say it is accessible. Supposing, for instance, the clutch were to get out of order (the best designed ones do sometimes), this means taking out and dismantling the whole unit; whilst a clutch which is hung on can probably be put right (anyhow made to do the driving) in a short time on the road.

He also mentions a noisy high speed front chain in a bulky chain case. Again, if anything goes wrong with this it can generally be remedied on the road, and in these days of silent chains and neat oiltight chain cases it is not necessarily any more noisy than a high speed bevel, which has been known to break, with dire results.

I like the novel way in which Mr. Bradshaw splits up a single chain drive into two; even so, it is then as efficient as a bevel if properly enclosed.

He mentions the advantages of the mechanical oil pump. I agree it has some over the hand pump and drip feed lubricator; but one of the chief advantages of the latter is that you can see it working, and vary the quantity of oil to suit the load on the engine. For instance, if the machine is doing 30 m.p.h. with the throttle nearly shut the engine does not require so much oil as when going up hill at the same speed with the throttle fully open; also, in my opinion, it requires more oil when going slowly than when going fast with full throttle. Another point in favour of the drip feed lubricator is that you do know the engine is getting fresh, cool oil instead of using the same hot oil over and over again as it generally does with a mechanical pump, which supplies oil in direct proportion to engine speed, which is obviously wrong, as the above shows.

H. WALKER.

Sir,—I am interested in the correspondence with reference to the A.B.C. motor cycle, and much appreciate the letter from Mr. G. Bradshaw in reply to his critics.

As an engineer and motor cyclist of fifteen years' experience, I am familiar with practically every well-known machine on the market, and in my opinion the A.B.C. is well ahead in design.

As Mr. Bradshaw says, it is always a question of compromise.

At last we have a motor cycle of ample power but light weight, properly sprung fore and aft, with a lubrication system equal to the best motor car. It is the transmission that I admire most, and I have tried both belt and chain drive. Surely nothing could be better or more efficient under road conditions than a good bevel drive running in oil, and a slow-speed chain. It seems absurd to talk of power being absorbed by the gears when one considers the advantages of such a system.

The standard type of machine with its countershaft gear, added as an afterthought, its two chain cases, etc., does not compare with the neat unit of the A.B.C. I cannot help thinking that Mr. Bradshaw will eventually enclose his chain, and certainly abandon the oil spray. I have tried it, and, although no doubt ideal with an enclosed chain, it is not a success in dusty weather with an exposed one. However, Mr. Bradshaw assures us that it is being tried.

In my opinion, the A.B.C. is a really beautifully designed machine, and, moreover, is thoroughly practical, and ought to be ideal, either for solo or sidecar work. What other motor cycle really is?

I have no more interest in the A.B.C. than any other machine commercially, but I am looking forward very much to having one.

Penrith.

GEORGE TAYLOR, A.M.I.A.E.

A USEFUL BOOK FOR MOTOR CYCLISTS

HINTS AND TIPS FOR MOTOR CYCLISTS.

One of the most useful handbooks for motor cyclists. It is full of valuable information and "wrinkles" relating to the purchase, driving, adjustment, management, equipment, repair, servicing, etc., of motor cycles. A feature of the present edition is the inclusion of illustrations showing the working of motor cycle engines—both two-stroke and four-stroke.

Price 2/- net. Bx net 2/3.

Obtainable by post (remittance with order) from
ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4.
or of leading Booksellers and Railway Bookstalls.

SOUTH WALES HILL-CLIMB.

SOME good sport was obtained at the Ystalyfera and Swansea Valley M.C.C. hill-climb, the results of which are given below:

CLASS I.—LIGHTWEIGHTS.

	m.	s.
J. Evans (2½ New Imperial) ...	1	25½
G. Cook (2½ Royal Enfield two-stroke) ...	2	0

CLASS II.—UP TO 4 H.P.

W. Leyshon (3½ Norton) ...	1	59½
Capt. A. Lindsay (3½ Norton) ...	1	6
Capt. A. Lindsay (3½ Scott) ...	1	9
D. E. Rees (3½ Sunbeam) ...	1	14
Glyn Rees (3½ Premier) ...	1	15
J. Morgan (3½ Premier) ...	1	16

*Fastest time of the day = 42 m.p.h. approximately. An excellent climb.

CLASS III.—UNLIMITED CAPACITY.

Capt. A. Lindsay (3½ Norton) ...	1	1
W. Leyshon (3½ Norton) ...	1	4
Glyn Rees (3½ Premier) ...	1	13½
D. E. Rees (3½ Sunbeam) ...	1	14
— Lyddon (3½ Premier) ...	1	18
J. Andrews (3½ Triumph) ...	1	24

W. Leyshon, 3½ h.p. Norton, who made the fastest time of the day at the Ystalyfera and Swansea Valley Hill Climb.

MINISTRY OF WAYS AND COMMUNICATIONS BILL.

THE following are extracts from a memorandum prepared by Mr. Rees Jeffreys, late secretary to the Road Board, at the request of the Motor Legislation Committee, and which proposes a number of amendments to the Ministry of Ways and Communications Bill:

"The Minister has undertaken that there shall be a separate Department for roads under General Maybury. General Maybury should be assisted by a Board Committee consisting of representatives of associations of highway authorities and traffic organisations. It should be provided that the Minister shall appoint a Road Committee of not fewer than ten members (exclusive of the head of the Department, who shall be the chairman of the committee), of which five members shall be representatives of local authorities, and five shall be representatives of road traffic problems. The following provisions are suggested:

"(a) That all roads shall be put into one of three classes. Class 1.—Arterial

roads or main lines of road communications. Class 2.—Secondary roads. Class 3.—Local roads.

"(b) That to Class 1 roads a grant of 50% per cent. of the cost of maintenance shall be paid; to Class 2 roads 25%; Class 3 roads to remain a local charge.

"It should be provided in the Bill that the Minister shall have power, on the advice of the Road Department or Board to prescribe the minimum width of arterial roads, i.e., to issue regulations providing that for the roads specified in the regulations no new building shall be erected within so many yards of the centre of the highway, without prejudice to the powers of local authorities to prescribe a greater width for that portion of the road passing through their areas. Similar powers should be conferred on county councils to conserve the width of Class 1 and Class 2 roads within their areas. At present new houses are often allowed to be built up to the edge of a narrow but important road, without sufficient space being provided even for a footpath. The inevitable result is that the passage

is permanently narrowed, or the local authority is put to the expense of securing the land and demolishing the buildings erected."

CORK M.C.C. MEMBERS' TRIAL.

THE Cork and District Motor Cycle Club held its second competition of the season on the 21st ult., when a members' reliability trial was held from Cork to Glandore and back. A very large number of prizes were offered in the event, and twenty-one competitors were sent away from Victoria Cross at 10 a.m. at customary intervals, as under:

D. Lucy (2½ Douglas), J. Gibbings (4½ B.S.A.), J. H. Wilson (3½ Rover), J. P. Frost (6 Enfield sc.), M. J. Hegarty (2½ Douglas), W. Waterman (7 Indian sc.), J. Atkinson (6 Ariel sc.), J. Ryan (2½ A.J.S.), W. Musgrave (4 Triumph sc.), C. G. Goode (5 Vindec), C. O'Connell (Baby Levis), D. Foley (3½ Rudge), S. R. Hosford (3½ Zenith), G. H. Ogilvie (4 Triumph), R. S. Russell (2½ Revere), F. B. Russell (4 Triumph), J. H. Watson (2½ Revere), E. Manley (2½ Sun), M. Murphy (4 Bradbury sc.), T. R. Popham (6 Enfield sc.), and J. Duggan (6 Enfield sc.).

The outward journey, *via* Ballinspittle, Timoleague, Clonakilty, and Leap, was not marked by any incident of note, save that Goode (Vindec) was in trouble and had to retire, while R. S. Russell, the popular hon. secretary, suffered from a broken magneto chain, and subsequently from a seized engine. Most of the others were on time at the luncheon stop. The return journey was made by the direct route through Bandon. Before reaching Cork three secret checks were taken, and as the margin of time allowed at the open controls was liberal, it is probable that these will decide the destination of the awards, which will be announced later. Sixteen of the starters completed the journey.

A gathering of the members of the Portsmouth N.M.C.F.U. prior to the opening run of this southern branch of the Union

LITTY

BRITISH MAGNETOS are better than any pre-war magnetos.

British Magnetos are being manufactured in ample numbers and types to cover all the possible requirements of British Manufacturers and Motorists

We, the following makers of British Magnetos, invite your enquiries for particulars of our various models.

British L.M. Ericsson Manufacturing Co., Ltd., Beeston, Notts.
British Thomson-Houston Co., Ltd., Coventry.
E.I.C. Magnetos, Ltd., Birmingham.

M-L Magneto Synd., Ltd., Coventry.
North & Sons, Ltd., Watford.
Thomson-Bennett Magnetos, Ltd., Birmingham.

Godbolds

In answering this advertisement it is desirable to mention "The Motor Cycle."

A35

The G.N. is exceptionally accessible. The detachable cylinder head, always a feature of the G.N. engine, and now being widely adopted by other makers, is extremely simple to detach, no skill, either, is needed in re-making the joint. Decarbonisation is thus doubly simplified, for not only is the head easier to detach than the ordinary cylinder, but the carbonised surfaces are immediately "getatable."

In the event of tyre trouble, the easily detachable wheel can be replaced by the spare, which procedure will appeal to owners of sidecars, combinations, in which structural design impedes tyre replacement. Further details and specifications from

G.N., Ltd., Etna Works,
Albert Road,
Hendon,
N.W.4.

HENDERSON SIDECARS, AERO WORKS, Sheffield

Leonard B. Henderson, A.M.I.A.E., Designer

A Privately Constructed Runabout.

Neat Three-wheeler on Morgan Lines.

THE privately-built runabout illustrated here is the work of Lt. W. G. Watson, R.N.V.R., of Spencer Park, Wandsworth Common, S.W., and is one of the few "amateur" productions we have seen which is not a contraption.

As will be seen from the photographs, Mr. Watson has taken the Morgan for his pattern, both as regards the frame design and the transmission system.

The engine fitted is a water-cooled 12 h.p. Spake-de-Luxe, an American make, which was used extensively by the makers of cycle cars in the U.S.A. This is supported on the lower members of the frame and behind the "axle" tubes. The radiator is located before the engine on the upper extensions of the duplex frame.

A leather-faced cone clutch is incorporated in the large outside fly wheel, and the drive is taken to the rear by an enclosed propeller-shaft, *via* a large diameter leather universal joint. Ball bearings are fitted at both ends of the shaft.

The gear reduction is by bevel wheels enclosed in a case, hence by two chains to the back wheel, the two speeds being obtained by dog clutches mounted outside the gear box.

Both front and rear springs are shown clearly in the photograph, and conse-

quently need not be described. Braking is by means of two internal expanding brakes operated by hand and foot. The hand-brake lever and change-speed lever are mounted on the central tube.

Steering is by worm and sector, and the wheelbase is 7ft. 10in., track 4ft. 2in.

The whole of the machine, excepting the engine and radiator, was made by Mr. Watson in just over nine months.

Showing front springing and splay of wheels.

The rear springing of the Watson cycle car.

A Variable Friction Gear and Engine Unit.

An Ingenious Design to give Two Points of Contact in Friction Gear.

THERE is much to be said in favour of the friction drive, when properly carried out, for the propulsion of motor cycles and cycle cars. It gives a graduated range of gears between its extreme limits, which enables a rider to suit his gear to every slight variation in the gradient or other conditions which may be experienced. We illustrate an ingenious adaptation of this gear herewith. The two-stroke engine to which it is applied has very much that is novel in its construction. For convenience, the drawing shows the cylinder in a horizontal position, but it will be readily understood that it may be also placed vertically.

The inventor, Mr. T. S. Smith, describes his idea as follows: "The design of this gear aims at the removal of the only probable source of trouble with friction gears, i.e., slip. The drawing shows the device adapted to a single-cylinder engine, but it is equally adaptable to a 'V' or opposed twin.

"The two flywheels of the engine serve as the driving discs of the gear, and are revolved in opposite directions by means of two connecting rods, which are fulcrumed in the piston on the same gudgeon pin. Springs are arranged on the crankshafts to keep the discs in engagement with the driven wheel, ball bearings being suitably disposed to sus-

An unusual design of engine and friction gear, by T. S. Smith, in which are incorporated two connected rods and crankshafts rotating in opposite directions.

tain the thrust. This arrangement of two driving discs in contact with the driven wheel on either side removes all unequal side pressure on the latter and reduces friction and consequent bearing wear to a minimum. Moreover, the use of two light connecting rods revolving in opposite directions in place of one heavy one will conduce to better engine balance and reduce vibration. It will also eliminate the side thrust of the piston on the cylinder walls. The driven wheel may be built up or made with spokes to serve as vanes, which will induce a draught of air on to the engine cylinder and assist cooling. A shaft transmission embodying a clutch, with bevel or spiral gear drive on to the rear wheel or axle, would constitute an admirable transmission system, for either motor cycle or light car. The gear, however, may be used in conjunction with a belt or chain drive as the final drive, if desired.

"Referring to the drawing, no attempt is made to show accurate detail, but simply to illustrate the general principle of the device, which offers a cheap-to-make, foolproof, infinitely variable gear, which, if used with shaft drive, would make an ideal transmission."

There appears to be no reason why this system of transmission should not be adopted with advantage for cycle cars.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Pre-ignition.

? My 2½ h.p. O.K. runs at about 20 m.p.h. for about five miles on full air and two-thirds gas; it then slows down and goes no faster than 10 m.p.h., when I have to retard air one-third, gas two-thirds advanced, till it stops altogether. After I let the engine cool down it runs well until it again behaves in similar fashion.—A.W.

The trouble of which you complain is probably pre-ignition caused by the use of an unsuitable plug, the points of which become incandescent and then cause the symptoms of which you write.

How to find the C.C.

Please tell me how to obtain the c.c. of an engine in both English and French measurements.—L.S.D.

The following is the formulæ for finding the cubical capacity of an engine:

$$D^2 \times .7854 \times S \times N.$$

D = Diameter of cylinder.

S = Stroke.

N = Number of cylinders.

This holds good for both French and English measurements, and gives the result in cubic millimetres and cubic inches respectively. The measurement is usually given in cubic centimetres, to get which divide the cubic millimetre by 1,000.

A Four-cylinder F.N.

? I recently purchased a second-hand F.N. four-cylinder, fitted with Bosch magneto and F.N. carburetter. Before delivery to me, the owner riveted a patch on the connecting rod, in order to strengthen a weak place, and fitted two new piston rings. (1.) I can now get it to run (after dopping through the induction pipe) for a distance of about two hundred yards, when it stops dead, without any knocking or signs whatever. The magneto seems all right; also the petrol supply to the carburetter. (2.) During running the cylinders heat up considerably. Can I do anything to keep them cool, or is it the usual thing? The machine, I may mention, is fitted with automatic inlet valves.—C.M.

(1.) Without actually seeing the machine it is very difficult to say what is the matter with it. It looks as if the carburetter is choked by some foreign matter; therefore the petrol system should be thoroughly and carefully overhauled. (2.)

The cylinders are bound to heat up; this is only natural, and they often reach such a temperature that you cannot bear your hand upon them. You can easily tell if the engine is overheating, by the fact of its knocking and losing power. The inlet valves should be examined, and you should see that each opens to the same degree, that the springs are fairly strong and have an equal tension. It seems as if a new connecting rod may be needed, as patching would be hardly safe, we should imagine.

Gears for Sidecars.

? (1.) I am in possession of a 3½ h.p. Humber Combination geared at 4 to 1 and 8 to 1. Do you think these gears too high for work on the Yorkshire hills? (2.) The driving pulley is 5in. in diameter. If I fit a 4in. pulley, what gear shall I get? (3.) When running on benzole, should I give a less opening of the air lever than that given to the petrol lever? (4.) What is the approximate amount of oil to petrol on the above machine?—W.A.C.

(1.) The high gear should be at least 5 to 1. (2.) If the 5in. pulley gives 4 to 1, the 4in. will give 5 to 1. (3.) Benzole requires much more air than petrol, and it is advisable to fix an extra air device on the induction pipe. (4.) The oil consumption is about 550 miles to the gallon, or eight times the petrol consumption.

Storing a Motor Bicycle.

? I have recently purchased a 2½ h.p. New Imperial motor cycle fitted with a two-speed gear, and I should be glad if you would answer me the following questions: (1.) As the machine will not be used much for some time, should the tyres be left pumped hard and the belt left on the pulleys whilst standing? (2.) Is the neutral gear only fitted for convenience in wheeling the machine about, or may it be used when descending long hills? Would any harm be done to the machine when top gear was again engaged at the bottom of the hill if the speed were high?—D.C.L.

(1.) Jack up both wheels, and leave the tyres moderately soft. The belt should be removed from the pulleys. (2.) The neutral gear is only for convenience in wheeling the machine about. If used for descending long hills, the dogs may be damaged while attempting to engage the high gear.

Fitting a Magneto Switch.

? Will you please explain to me how I can fix a magneto cut-out to my Douglas? Please explain as simply as possible, as I have only just taken up motor cycling. Also, please inform what I shall need to buy.—W.E.A.

If there is not a terminal on the contact breaker cover, write to the makers of your magneto for one, and on receiving it connect a wire from a switch on the handle-bar to the terminal on the contact breaker cover.

A Cracked Cylinder.

? I have had the misfortune to break the cylinder of my 4 h.p. 1913 Bradbury. Can you account for the fracture? I have had back fires when starting, but the only conclusion that I can come to is that the piston stopped exactly at top dead centre, and that the explosion had to move something; but even then the pressure is only 160-200 lb. per sq. in.—is it not?—which it should have been able to withstand.—A.T.S.

The fracture was probably caused by screwing up the holding-down nuts of the cylinder unequally, and is hardly likely to be due to any fault in manufacture or material. The explosion pressure may be as much as 350 lb. per sq. in.

Fitting a Speed Gear.

? (1.) I wish to fit some form of gear to my 1913 clutch model Rudge motor cycle. If I fit a Rudge-Multi gear, would any alteration to the frame be necessary? (2.) Shall I require a new half crank case if I fit the Rudge-Multi gear? (3.) Is there any countershaft gear that I can fit to this machine? (4.) Can you recommend any two or three-speed hub gear (without hub clutch, if possible) that would be suitable for this machine?—B.V.S.

(1.) We do not think any alteration to the frame is necessary, but you had better communicate with the makers, Messrs. Rudge-Whitworth, Ltd., Coventry. (2.) New half of crank case will not be required, but the crankshaft of the single-gear model may be too short. (3.) You can fit an Albion change-speed gear by obtaining lugs and connections from the makers of the gear, Messrs. The Albion Engineering Co., Upper Highgate Street, Birmingham. (4.) The Sturmey-Archer three-speed hub would be suitable. Write the makers, Messrs. Sturmey-Archer Gears, Ltd., Lenton, near Nottingham.

SHOULD THE DEAF AND DUMB USE MOTOR CYCLES?

In view of this question, which is frequently brought up in our columns, the photograph has exceptional interest. It is unique in the fact that the riders are all deaf and dumb. It is their intention to form a social and motor cycling club in the Midlands.

Lubrication.

I have a 2½ h.p. two-stroke Ivy. Please tell me : (1.) If the petroil system of lubrication is satisfactory when running on benzole, and, if so, how much oil per gallon should I use? (2.) Please tell me how to prevent the plug from fouling. Is this due to insufficient air or excess of oil, or perhaps both?—E.S.A.

(1.) The petroil system of lubrication is satisfactory with any fuel (use half a pint of oil to one gallon of fuel), but it is somewhat messy. (2.) The trouble might be due to both causes; it is best to use a plug with a rather thick electrode if you can obtain one.

Difficult Starting.

(1.) I have a 2¾ h.p. 1914 two-speed two-stroke, which I have to push from ten to fifteen yards before it will fire; but even when it does fire, it repeatedly misfires after a couple of minutes, and on hills it will gradually slow and eventually stop. (2.) Also, when wheeling the machine with all levers set for starting, smoke issues from the carburetter (a Senspray). Should this be so? (3.) I am using benzoline as fuel. Is this correct, or should it be mixed with something else?—W.C.G.B.

(1.) The machine seems to start fairly easily if it will start in ten or fifteen yards. The misfiring may be due to a variety of causes: too large a jet (which we rather suspect is the case) or to water or other impurities in the fuel. (2.) This is nothing uncommon, and you need not let this worry you. (3.) The fuel you are using is probably benzole. This will be quite in order, either mixed with petrol or used neat. It should, however, contain no impurities. In some benzole now on the market there is a certain quantity of water, and it should, therefore, be strained through a very fine gauze.

Loss of Water.

In driving a 1916 G.P. Morgan I find that after running for about half an hour on top gear, the engine fails to pull properly. On examination, it was found that a great deal of the water in the radiator had evaporated, and had to be replenished. While running for one and threequarters of an hour entirely on bottom gear (during which time a distance of twenty-eight miles was covered), the water in the radiator showed no signs of boiling. I should be much obliged if you could advise me regarding the possible cause of the trouble.—M.S.D.

Without actually seeing the machine it is a little difficult to say what is the matter with it, but it looks very much as if there is a leakage of water somewhere, as an appreciable amount should not evaporate. We should therefore recommend you to look to the radiator and all connections, and see that they are water-tight. Why run for so long on low gear?

READERS' REPLIES.

Difficult Starting.

As an all-weather and all-winter rider for the past seven years in the cold, inclement North, and having fully experienced the weight and worries of war petrol, the following simple device completely solved my heart-breaking starting difficulties. Instead of pushing rag into the air intake I have a piece of strong cloth (carpet 1½ in. x 2 in.) which hangs loosely from a piece of wire or ring around the throttle wire of the Amac carburetter. When starting I fix this piece of cloth tightly over the main air intake. Then sprinkle the cloth with petrol until saturated or dripping. With everything else in order a push of a few yards gives a splendid start. Whatever air is sucked through the cloth vaporises the petrol and supplies a good firing mixture for 200 or 300 yards. Suction keeps the cloth rigid against air intake, or a bent pin projecting from

a wire gauze cover will secure this sufficiently. After a couple of hundred yards a slight touch of the hand will brush the piece of cloth aside from the air intake, and being fixed on a loose ring it will naturally fall or get blown round behind the carburetter, where it will be always clean and ever handy for use. Anybody can suit the above device to any other make of carburetter. I have a hazy recollection that I saw this tip hinted at in your ingenuity-developing paper some six years ago. But it took stubborn war petrol to requisition many of your invaluable hints, which some of us may have then regarded as primitive and superfluous.—HO KUKLOS, Killygordon.

In reply to "A.G.," who has difficulty in starting a 1913 Rex, I think the trouble is caused by the sticking of the high gear clutch. If the operating pin does not come out this is the cause. I have just had a taste of it, and was a long time in making the discovery.—J. D. MACPHERSON.

EXPERIENCES WANTED.

E. Whittaker (Batley) would like readers' experience with the Grado-Multi gear for sidecar work with a 4 h.p. engine.

RECOMMENDED ROUTES.

CHATHAM TO BRIGHTON.—F.P.B.

Chatham, Maidstone, Nettlested, Tunbridge Wells, Crowborough, Uckfield, Lewes, Brighton.

CANNOCK TO BLACKPOOL.—N.W.

Cannock, Stafford, Eccleshall, Woore, Nantwich, Tarporley, Warrington, Ashton-in-Makerfield, Wigan, Preston, Blackpool.

WOLVERHAMPTON TO HOLYHEAD.—R.S.

Wolverhampton, Wellington, Shrewsbury, West Felton, Llangollen, Corwen, Pentre Voelas, Bettws-y-Coed, Capel Curig, Bangor, Holyhead. Approximately 120 miles.

The A.V. Cycle Car.

The little single-seater shown on page 533 of the issue of April 3rd is the latest type of A.V., and is manufactured by Messrs. Ward and Avey, Ltd., Somerset Road, Teddington.

To Handle the Wooler.

Mr. A. C. Robins, who was a skilled rider of a Humber in 1910-11-12, and who drove a Triumph in 1913 and a L.M.C. in 1914, has now been appointed assistant sales manager of the Wooler Engineering Co., Ltd., Alpertown.

A New Repair Depot.

We understand that a repair works has been opened for Matchless motor cycles under the title of the Matchless R.P.R. Works, 160, Regent's Park Road, London, N.W.1. and that Messrs. H. Castell and H. Wright are the works engineers.

Reports on Machines.

Any motor cyclist requiring independent opinion on either motor cycles or cars in the Manchester district may be interested to know that E. Woods, A.M.R.Ae.S., Campfield Chambers, 312, Deansgate, Manchester, is prepared to make such reports.

New Garage in Cork.

Jack Healy, well known in trade circles as "Tim," the popular Irish competition rider, has been demobilised from the Army, in which he has been serving as a despatch rider since 1914. He has opened a garage in Cork, with the A.J.S. and Norton agencies.

Fire at Tyre Works.

The works of the Beldam Tyre Co., Ltd., having been partially destroyed by fire, the manufacture of inner tubes and the Combination "V" steel-studded tyre, and all retreading work, is temporarily suspended. The all-rubber tyre output, however, will, fortunately, not be interrupted.

Premier Three-wheelers.

The ownership of the Premier name in connection with motor cycles and cars has long been an uncertainty, so far as the public is concerned. The original Premier Cycle Co., now the Coventry Premier, Ltd., made Premier motor cycles, and are producing the Premier super runabout, a three-wheeler of promising design. The Premier Motor Co., of Birmingham, made Premier cars, but had no connection with the original Premier Co. Later the latter concern made a three-wheeler, which was known as the P.M.C. Finally, there is the Premier Motor Engineering Co., of Bolton, who are introducing the M.B. three-wheeler. All this is very confusing to the buyer of three-wheelers, new and second-hand.

Belt Slip.

The majority of riders of belt-driven machines have had the annoying experience of a slipping belt, generally on a wet and disagreeable day. An excellent antidote for belt slip is Sterns's belt brick, marketed by Messrs. Sterns, Ltd., of Royal London House, Finsbury Square, E.C.

Booklets.

Messrs. J. A. Prestwich and Co., Ltd., Northumberland Park, Tottenham, London, N.17, inform us that their booklets, which give valuable information concerning the J.A.P. engines, are temporarily out of print. The matter is one which it is hoped will be remedied very shortly.

Gloria Sidecars.

In future Gloria sidecars will be made suitable only for Triumph motor cycles, and will not be available to the general public for fitting to other makes of machines. The Gloria Cycle Co., Ltd., is a subsidiary company to the Triumph Cycle Co., Ltd., Coventry, to whom all communications respecting Gloria sidecars should be addressed.

Universoline.

We have lately received a sample of Universoline, a preparation for rendering joints gastight, sold by Messrs. Sterns, Ltd., Royal London House, Finsbury Square, London, E.C.2, and for facilitating the screwing and unscrewing of unions, nuts, or bolts. The formation of rust in the threads is obviated, and the articles can be unscrewed at any time, even if they have been exposed to water. We hope to report on its behaviour at a later date.

Well-deserved Promotion.

Mr. Arthur Wright, who has held a prominent position on the staff of the Triumph Cycle Co. for the last twenty-three years, was in 1914 appointed assistant secretary to the company. Recently he has had a further promotion, viz., to the position of secretary. Mr. Wright is well known to Midland cyclists and motorists, and has held the post of honorary treasurer of the Coventry and Warwickshire Motor Club for nearly ten years. He is an active motorist, and has ridden a motor cycle from the earliest days of the pastime.

Catalogues Received.

We are in receipt of a folder giving the latest information concerning the 1919 two-stroke Radco, made by Messrs. E. A. Radnall and Co., Vauxhall Works, Dartmouth Street, Birmingham.

The 1919 G.N. catalogue is to hand, and illustrates the Standard and Vitesse models, with a plan showing the details of the chassis. Very complete particulars of these cycle cars are given. G.N., Ltd., Etna Works, Albert Road, Hendon, N.W.4.

"The Metro-Tyler Two-stroke." The Tyler Apparatus Co., Ltd., Banister Road, Kilburn Lane, Kensal Rise, London, N.W. 10. The publication illustrates and describes the handy little lightweight, which we have previously described in these pages, both single and two-speed models. The company announces an advance of 7½% on the price of the single speed.

THE KING DICK BELT FASTENER.

A WELL-MADE belt fastener has lately been placed on the market by Abingdon-Ecco, Ltd., Tyseley, Birmingham, makers of the world-famed spanners which have so long been used by engineers in this country.

As may be expected, the new belt fastener is of thoroughly sound design and made of first-class material. It may be pointed out that the clamps are serrated on the inner sides so as to clip the belt ends firmly. Hardened steel bushes of hexagon form take the wear, and the fastener locks automatically and cannot work loose. It possesses the advantage of being capable of being opened or closed

King Dick fastener.

instantaneously, and there are no loose pieces to fall about when it is uncoupled.

The belt fastener is well finished and practically rust-proof. It is made suitable for ½in., ¾in., 1in., and 1½in. belts. It is, moreover, moderate in price.

STATE OF THE ROADS TO NORTH WALES.

MOTOR cyclists from London and the Midlands usually choose the route *via* Stonebridge, Chester Road (Erdington), and Brownhills. From Chester Road nearly all the way to Brownhills the road surface is very bad, the pot-holes are numerous and practically unavoidable, as they stretch from one side to the other. From Brownhills to St. George's (Wellington) and on to Shrewsbury and Llangollen the surface is good, but from the last place to Corwen and beyond there are a number of patches of loose stones.

From Bettws-y-Coed, *via* Llanrwst to Conway, the road is quite good. Those who want to follow the left bank of the river from Bettws should avoid the stretch between Bettws and Llanrwst (this section has been much cut up by timber haulage) by keeping to the right bank and crossing the river at Llanrwst Bridge. The left bank from Trefw to Conway is fairly good.

The bad stretches of road between London and the Midlands and North Wales can be avoided by travelling as follows: Stonebridge to Coleshill (excellent), Bassett's Pole, Wall, Muckley Corner, and along Watling Street *via* Weston-under-Lizard and Newport (Salop).

There is a bad stretch between Weston and the Shifnal-Newport road; after that the surface is excellent through Hinstock, Whitchurch, Wrexham, Mold, St. Asaph, to Conway. The roads through the camps at Whitchurch and Kinnel require care, but are not at all bad. From Abergele to Colwyn Bay and from Whitchurch to Chester the road is excellent.

Everyone wants Peace and MOTOR CYCLES.

The desire for an early peace is great—but the demand for immediate deliveries of motor cycles can best be described as frantic.

Everyone wants his machine at once, and Manufacturers and Agents are inundated with orders which it will take months to execute.

To advertise machines as being in stock is ironical, because they are snapped up long before the advertisement can appear—at least, that is Godfrey's experience.

To make definite promises of delivery is asking for trouble as, owing to causes entirely beyond their control, manufacturers are more often than not unable to keep their promises to the agents.

All we can say is that, as Sole Distributing Agents (London and Home Counties) for

A.B.C., BLACKBURNE, INDIAN and SCOTT Motor Cycles

we can give the most favourable deliveries of these models, and as large Contractors for all other well-known makes we are receiving a good share of the present limited supplies.

We are not refusing Orders, but we feel it is only right to frankly explain our position. Your order—if you decide to place one—will be executed in strict rotation and as early as possible, but we can make no definite promise as to delivery. Any machine available goes to the first name on the list at the fixed retail price, and no offer of a premium to secure priority is ever entertained by Godfreys.

We are keenly alive to the fact that upon the custom and goodwill of our numerous friends depend the success of our business. We have not the slightest wish to take up an independent attitude, and every desire to accept and execute any and every order; but it is not fair to the Customer, and not fair to ourselves to make promises which cannot be carried out.

Later on (in a very few months we hope), when machines are coming through regularly and in ever-increasing numbers, we shall be able to satisfy all our Customers. In the meantime, we can only express our regret—that the supply of machines is not equal to the present demand.

GODFREY'S LTD.,

208, Gt. Portland Street,
LONDON, W.1.

Phone: 7091 Mayfair (2 lines).

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 12 words or less 2/6, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **Treasury Notes**, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "The Motor Cycle," 20, Tudor Street, E.C.4. Replies to Box Number advertisements containing remittances should be sent by registered post.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged; when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

CALCOTT 2½ h.p., 1914, variable pulley, Bosch, new tyres, stored, just overhauled, splendid condition; 29 gns.—14, Sydenham Hill, S.E. [8835]

Calthorpe.

C. BERRY'S.—2½ h.p. 2-speed Calthorpe; bargain, £36.—125, Canal Rd., Mile End, E. [8850]

CALTHORPE-J.A.P., 2½ h.p., Enfield 2-speed, clutch, free engine, good order, condition, ready ride away; 36 gns.—Harrington Rd., Newwood Junction. [8435]

EASTERN GARAGE

IF YOU REQUIRE

Early Delivery

it is essential to

Order Now

We have placed contracts for all the most desirable motor cycles, and, for the guidance of intending purchasers, we state below the position regarding deliveries of each make. Enquiries will receive immediate attention, and we shall be pleased to send Catalogues giving current prices.

ALLON, 2-stroke; delivery May.

A.B.C., 3 h.p.; delivery June.

ARIEL, 3½ h.p.; delivery commenced.

ARIEL, 6 h.p.; delivery 7 days.

BLACKBURN, 2½ h.p.; delivery June.

BLACKBURN, 4 h.p.; delivery May (early).

BLACKBURN, 8 h.p.; delivery May (late).

BROUGH, 3½ h.p.; delivery May.

B.S.A., 4½ h.p.; delivery commenced.

CALTHORPE-J.A.P.; delivery 7 days.

CALTHORPE, 2-stroke; delivery 14 days.

CLYNO, 2-stroke; delivery 2 weeks.

CLYNO, 8 h.p.; delivery June.

DIAMOND, 2½ h.p.; delivery 7 days.

DOUGLAS, 1919 models; delivery June.

HENDERSON, 8-10 h.p.; delivery indefinite.

JAMES, 2-stroke; delivery May.

JAMES, 4½ h.p.; delivery 14 days.

JAMES, 6 h.p.; delivery 14 days.

MATCHLESS, 8 h.p.; delivery suspended.

METRO-TYLER, 2-stroke; delivery 7 days.

NEW IMPERIAL, 2½ h.p.; delivery 14 days.

NEW IMPERIAL, 8 h.p.; delivery commenced.

NORTON, 3½ h.p.; delivery May.

NORTON, 4 h.p.; delivery May.

N.U.T., 3½ h.p.; delivery May.

OMEGA, 2½ h.p.; delivery May.

ROVER, 3½ h.p.; delivery May.

ROVER, 6 h.p.; delivery May.

ROYAL ENFIELD, 2½ h.p.; delivery commenced.

ROYAL ENFIELD, 3 h.p.; delivery commenced.

ROYAL ENFIELD, 6 h.p.; delivery commenced.

SUN, 3 h.p.; delivery May.

TRIUMPH, 2½ h.p.; delivery commenced.

TRIUMPH, 4 h.p.; delivery commenced.

ZENITH, 5 h.p., twin; delivery commenced.

ZENITH, 6 h.p., twin; delivery indefinite.

SIDECARS.

CANOELET; delivery 14 days.

EMPIRE; delivery 7 days.

GLORIA; delivery 4 weeks.

MILLFORD; delivery April.

SWAN; delivery 7 days.

MOTOR CYCLES FOR SALE.

Calthorpe.

CALTHORPE 2-stroke, brand new, with tools and pump; 36 gns.—Clayton, Garage, Hermitage Lane, Childs Hill, N.W. [8652]

1915 Calthorpe-Jap, 2½ h.p., Enfield 2-speed, stored since 1916, excellent condition; 36 gns.—39, Upton Rd., Dalston. [8722]

1916 Calthorpe-Jap 2½ h.p., 2-speed, splendid condition, all accessories, ride away; after 7; 40 gns.—8, Crowland Terrace, Essex Rd., N.1. [8577]

GUMMERSON, 5, John's Place, Acton.—2 h.p. Calthorpe-Precision, thoroughly overhauled, replated, and re-enamelled, a perfect lightweight; £30. [8706]

1915 Calthorpe-Jap, 2½ h.p., Enfield 2-speed, Lucas lamp and horn, stored 18 months, equal to new; 34 gns.—C. Lewis, The Haven, Dilwyn, Herefordshire. [8534]

CALTHORPE-J.A.P., 2½ h.p., good condition, spring forks, acetylene lamps, Enfield 2-speed gear; £35; inspection invited.—Statia, 70, Parliament Hill, Hampstead, N.W.3. [8399]

CALTHORPE-J.A.P., 1915½, 2½ h.p., Enfield 2-speed, Scanspray, X'All, thoroughly overhauled, stored 18 months, looks like new; £35.—Dunkley, 206, Cavendish Rd., Balham. [8561]

CALTHORPE Combination, 4 to 5 h.p. J.A.P., late 1916, mechanically perfect, Enfield gear, handle starter, fitted auxiliary tank, spares; £70.—Catherham, Hamsted Rd., Southend-on-Sea. [8537]

Campion.

1917 Campion, 2½ h.p., new condition; £40.—Reeves, Guildford Rd., Farnborough, Hants. [8620]

Centaur.

CENTAUR Lightweight, new condition; £28.—H.S., 33, St. Stephen's Rd., Bow, E. [8659]

CENTAUR and Coach Sidecar, 3½ h.p., new tyres, free engine, 2 speeds; any trial; £45.—Godwin, 7, Conal Rd., Mile End Rd., E. [8625]

1914 Centaur Combination, 2-speed, clutch, handle start, lamps, horn, splendid condition; £65.—Address, 53, Hawk's Rd., Kingston-on-Thames. [8800]

Chater-Lea.

1916 Chater-Lea Combination, 8 h.p., lamp, tools, screen and hood, as new; £140.—7, Moyers Rd., Leyton. [8716]

CHATER-LEA 6 h.p. Twin, good condition, fast; £30.—After 5.30, Francis, 56, Smart's Lane, Loughton, Essex. [X9092]

CHATER-LEA, 3½ h.p., adjustable pulley, good condition, just been overhauled; £25.—Plumstead Vicarage, Woolwich. [X8805]

CHATER-LEA 8 h.p. Combination, 1914 model, 3-speed, chain drive, 700×80 car tyres, Searle non-hurstable tube in rear wheel, handsome coachbuilt sidecar, takes 3 anywhere; any trial; £85.—Portland Lodge, Lyme Regis. [8543]

1914 8 h.p. Chater-Lea Coachbuilt Combination, just overhauled, re-enamelled and plated, 3 in. tyres, 1 new Palmer cord and tube, new Amac carburettor, K.L.G. plugs, 3 electric lamps and battery, screen, horn, mirror, pump, and tools, looks like new; first offer over £100 secures.—Wilson, 116, Springbank Rd., Ilfith Green, S.E. [8873]

Chater-Jap.

CHATER-J.A.P. 8 h.p. Racer and Coachbuilt Sidecar, overhead valves; £65.—The Avon Motor Cycle Co., Southbridge Rd., South End, Croydon. [8908]

5-6 h.p. Chater-Jap, T.T., spring frame, 2-speed, Bosch, Binks, fast, powerful, £48; also torpedo sidecar, £4; offers.—273, High St. North, East Ham. [8875]

Chater-Peugeot.

CHATER-PEUGEOT, 6-6 h.p. twin, Bosch, Son-spray, coach sidecar, new Rock 2-speed, handle start, good condition, lamps, horn, trial, tyres good, drip feed; £55.—4, Park St., Berkhamstead. [X9046]

Clyno.

CLYNO.—Earliest deliveries.—Your name on our list ensures this.—Martin Mitchell, Ltd., Stafford. [7659]

CROW Bros., High St., Guildford, West Surrey agents for the 1919 Clyno. Order now to ensure early delivery. [1653]

6 h.p. Clyno, 1912, in splendid condition, engine just overhauled; £35.—Oswell, Cross Keys, Hadley, Salop. [X8994]

5-6 h.p. Clyno and cane sidecar, 1914, excellent condition; £55. Seen any time.—Borden Vicarage, Sittingbourne. [X8712]

GROVER, Smith and Willis, Basingstoke.—Agents for Clyno combination. Don't wait until the fine weather comes before placing your order. [6263]

CLYNO Late 1914 Combination 5-6 h.p. Twin, 3-speed countershaft gear, spare wheel, excellent condition; price £95.—Apply, Hemming, 37, Scrutton St., Finsbury, E.C. [X9128]

CLYNO.—Lient, R. G. Parker, A.M.I.A.E., is now demobilised after 4½ years' service in the Army, and can give your enquiries his personal attention.—Earliest deliveries of Clynos from Parker and Son, St. Ives, Hunts. [8901]

Motor Cyclists and the Budget.

MOTORISTS in general spent a somewhat anxious time in awaiting the Budget, but their patience has been well rewarded. In a few days' time petrol licences will be abolished, and the Petrol Control Department will be but a bad dream of the past. It has been officially announced that all petrol licences will be withdrawn on Saturday, May 17th, but we hear that it is doubtful if they will be issued after Saturday next. With the licences the sixpence super-tax goes by the board, so petrol will be that much cheaper for the motor cyclist. Furthermore, it was recently stated in public by a well-known petrol magnate that there was so much of this fuel in the country that it was difficult to know where to place the fresh cargoes arriving, and that so soon as the Government control of the fuel ceased it was bound to come down in price. It seems, therefore, that after the long years of weary waiting and privation a happier time is in store for us all. Readers are reminded that they may return their licence books to the Petrol Control Department, 19, Berkeley Street, London, W.1, and obtain a refund of the tax on every gallon of petrol which has not been purchased. The earlier the licences are sent back the earlier will the money be refunded, as thousands of licences will have to be dealt with.

It is pleasing to note that the Government promise that the petrol super-tax was to be purely a war measure has been kept, but we cannot help feeling that the tax should have been removed several months ago, as the charge on motorists has been heavy, and the cost of collecting it has been enormous. No fewer than 300 persons were employed by the Department. The official announcement that there is to be no tax on our home-produced fuel, benzole, of which 100,000 tons are being manufactured per annum, is good news. The Chancellor of the Exchequer also declared that the luxury tax would be abandoned. All this makes good reading, and what with

cheaper fuel, and the dropping of the luxury tax, which would certainly have been levied on the more expensive motor cycles, we indeed feel we have been spared to enjoy happier times. Mr. Chamberlain also pointed out that there might be some further taxation on motor cars, but that the matter would be given consideration and would be postponed till the next Budget. Before that time it is to be hoped that the Auto Cycle Union and the other motoring organisations will have carefully put the case of motor cyclists before the Chancellor. The motor cyclist is taxed quite severely enough already, and it is obviously unfair to place an extra burden either on the private owner or on the trade. It is, moreover, essential to point out, as we have previously done at considerable length, and on many occasions, that the Treasury formula is not justly applicable to motor cycles. Sufficient unto the day is the evil thereof, but we must be prepared.

The Future of the Motor Cycle.

IN this issue we make reference to the circulation of this journal, and we think that the majority of our readers will recognise the portent of the record attained by *The Motor Cycle* in automobile journalism. Our natural pride in the achievement is not mere self-satisfaction; in this unprecedented demand for *The Motor Cycle* we see ahead a time of exceptional prosperity for the industry and a motor cyclist community expanded even beyond enthusiasts' anticipations. Nothing succeeds like success, and every new motor cyclist joining the fraternity probably is the means of inducing at least one other to become an owner—and so the demand for the most economical motor vehicle goes on increasing. Motor cycles are becoming really popular with the general public: old prejudices have gradually been lived down. For utilitarian purposes, also, the motor cycle is now appreciated at its full value, and altogether the promise of the future is brighter than ever before.

Occasional Comments

by "Ixion"

Woolly Engines.

SO far as I know, nobody has ever tested public opinion on the question of whether the public prefers a woolly or a hotstuff engine. Of course, the books of various companies which have coquetted with both types must tell a tale to a careful student; and we could all mention names and years to identify certain models in which a rational compression ratio was incautiously exceeded. If this paragraph should provoke any correspondence, the letters will probably be unreliable as a guide, for the men who are keen enough to write letters to us are generally bitten with the speed mania. I rather fancy that 75% of us would vote for an engine which is easy to start, reluctant to conk, and does not require much humouring on its controls. Now, my impression is that quite a lot of British makers neglect these aspects of driving pleasure, whereas the Yankee designer values them more shrewdly. Unless American track timing is a farce, nobody can put up better racing stunts than the Yank—at any rate, with the 7 h.p. machine, which is his pet speciality. But he regards the track type of engine as the “pidgin” of the advertising department; and he re-designs that engine before he sends out roadsters to his agents. In England some at least of our manufacturers run short of self-restraint at this point. They turn out a stunt ’bus for competition work, and their road model comes too near being its twin brother. One result is that we produce the most efficient small machines in the world; another, to my thinking, is that we oppress fat, elderly riders with engines which are not woolly enough to suit them. Of course, the ideal is a stunt ’bus which can be woolly on the road; and I rather fancy one or two post-war machines may realise this ideal. But before the war I estimate that some of our firms were not in sufficiently close sympathy with the average buyer; let them visualise the “John Citizen” of “Poy’s” cartoons in the *Evening News*, and they will get the kind of man I mean. He buys seven motor cycles out of every ten sold in this country; and he is scared to death by an engine which revolves eight times backwards if it pulls up against a compression when he is trying to start it.

Automatic Carburetters.

FOR similar reasons I am rather surprised that manufacturers first of all fit the two-lever carburetter almost exclusively, and, secondly, adjust it to close far enough to stop the engine. I have not the very slightest doubt that the “John Citizen” type of user prefers an automatic carburetter, even if he thereby incurs a trivial addition to his fuel bill. I am well aware that shutting the throttle is technically the best method of stopping our engines. Driving on the valve lifter is not good practice, switching on and off is equally bad, and declutching is deprecated because the average motor cycle engine is imperfectly balanced and imperfectly silenced. Nevertheless, a

duffer will find control very considerably simplified if he is relieved of the air lever, and is prevented from accidentally stopping his engine by shutting his throttle too far. Now that the A.I.D. have developed an “absolute” system of carburetter tuning by using the flowmeter to gauge jets, automatic carburetters can be correctly set at the works without any expenditure on skilled testing.

Another Fallacy Gone?

IT will be interesting to see whether the flowmeter reduces the range of the old lottery about engines. It used to be believed that the track, Brooklands, and Six Day trade machines were fitted with engines which were selected from output by dint of their making a specially brilliant show in the firm’s routine tests; and that, outside these “star” engines, considerable variation existed, so that a lucky customer received a ’bus which was 5 m.p.h. faster than the one delivered to his next-door neighbour. I heard a knot of enthusiasts discussing the matter the other day, and their conclusion was that the carburetter was always responsible for such differences, that gauging jets by the drill used in manufacture accounted for carburetter vagaries, and that flowmeter testing would reduce these 20,000 outputs we hear of to a uniform efficiency.

These doughty warriors were arguing from the A.I.D. tests of aero engines, in which experience shows that uncommonly level results are usually obtained from aero engines. Factories turning out one hundred engines a week found remarkably little difference in the exactly recorded test results. I should be the last to deny that the carburetter had a lot to do with pre-war variations in motor cycle engines of the same make. Our engines are as sensitive to their carburation as their riders are to the functioning of their livers or the amount of liquor on board at any given moment. I have wasted innumerable hours retuning standard carburetters and fitting experimental vaporisers; as a rule, a new tuning or a different instrument will alter the behaviour of an engine most perceptibly. I always used to blame factory testers for the ease with which factory settings could be bettered; to-day I admit that the absence of an accurate system of gauging jets at the carburetter’s place of origin was the prime factor.

Nevertheless, the “star” engine will still pop up in every batch proceeding through some factories; and in others it will never appear at all. For example, some factories still use hundredth inch gauges, and “run the engine in” after assembly, warning credulous customers not to drive the ’bus all out for the first five hundred miles or so. Other factories employ scientific methods of manufacture, and experience no call to “wear their engines in.” They will lightly take a brand new engine down to Brooklands, and guarantee it to lap at over sixty on its third circuit. In other words, you get the “star” engine once in

SCENES IN A FAMOUS 'VARSITY CITY.

(Left) A Matchless outfit in New College Lane Oxford.

(Right) By Brasenose College. It was in this neighbourhood that the meetings of the notorious "Hell Fire Club" used to take place.

every 500 or 1,000, where workmanship is poor, and gauges are sloppy; but it is not really a star engine at all—it is rather the normal which all the other engines could and should reach in a decently run works. In a better class factory, *all* the engines will be stars. One maker said to me recently, "I was always *afraid* you'd buy one of our pre-war machines from an agent—I may as well confess that our standard 1914 engine wasn't any great shakes. Now we've had four years on aero work, and I *hope* you'll buy one selected at random from any agent's stock.

Obturator Rings.

THE letter under the above title in our issue of April 24th might impart a wholly false impression to any readers who regard obturator rings as one of the "hush-hush" secrets of the war. They were long ago eliminated from all aircraft engines in the British service, with the single exception of a small "school" engine, even the later rotaries being innocent of them. It is common knowledge that one or two inventors are exceptionally busy patenting novel applications of the idea just now, but it is by no means certain that they are sure of a renewed lease of life.

Sociability.

DURING a recent week-end I sampled the Portsmouth Road, and was principally impressed by the enormous number of sidecars, and the size of the loads which the combinations carried. Sidecars seemed to be perceptibly more numerous than solo machines, whilst many of the latter had flappers on their brackets. Evidently the unsociability of the solo machine is its worst enemy, and this is emphasised by the popularity of sidecars and pillions—the latter positively dangerous. At least one sidecar outfit in three carried an extra passenger on the carrier, and frequently two or three youngsters were stowed away in front of Mamma in the car. Ructions are not unknown in happy motor cycling homes as the quiver begins to fill. In more than one case, Mamma was in the saddle, Papa on the carrier, and the sidecar was wholly occupied by mixed olive branches. In these turnouts, Papa

looked either henpecked or debonair; in the former instance he was evidently relegated to the carrier for good—in the latter he wished to create the impression that *camaraderie* existed between him and his better half, and that they took tricks at the wheel; I hope they did. I returned to town in a meditative mood. When I marry, there will be no nonsense about a sidecar honeymoon; I shall buy my bride a lady's model Douglas; it is better so. By the way, I did not see a single machine *en panne*, despite overloading and the terrible road vibrations.

A Tinny Whirr in the Gear Box.

A CORRESPONDENT writes in some alarm because, although his gear box retains the usual three effective gears, it is prone to emit a "tinny whirr," and the noise continues although he has stuffed the casing as full of lubricant as it will hold. He dare not attempt to dismantle the box, and the one and only repairer within ten miles refuses to investigate the affair. I think there is no doubt that one of the ball races is loose in its housing; the outer race is a press fit in a housing in the aluminium casing, although this method of construction is not particularly good practice. All that is necessary is to take the gear box down and tin the outside of the ball race so that it will be a better fit in the housing. I do not think my correspondent need be afraid of the job, and I offer him two tips to assist in a more ambitious job than he has yet tackled. The first is to swill the gear box absolutely clean with paraffin before he starts so that he can see the parts and will not be baffled by afterwards discovering mysterious washers for which he can find no home, because they were embedded in lubricant when he took it down: the second is to write and ask the maker for a blueprint section of the box.

100,000 !

The Weekly Circulation of "The Motor Cycle" actually Exceeds 100,000 Copies, constituting a World's Record for Automobile Journals.

A Bright Outlook for the Future of the Pastime.

A 30,000 GATE. Imagine a crowd more than three times the size of the one shown above and some conception of our circulation figures will be gained.

STILL another record by the motor cycle, but this time not on Brooklands!

Our readers have rendered it possible for this journal to set up a new world's record in the circulation of motoring journals. Of course, *The Motor Cycle* has always led among motor cycling papers, but never has the figure of 100,000 been reached hitherto by any motoring periodical—car or motor cycle. The war merely delayed the achievement, for in 1914 our weekly issues reached the high figure of 93,000 copies.

It is sixteen years since No. 1 of this journal saw the light, the first issue being dated March 31st, 1903. For over six years it was the only paper devoted to the pastime, during which time *The Motor Cycle* piloted the movement through the most difficult period of its history. During this time our campaign for change-speed gears was launched, the magneto perfected, and the solution of motor cycle design successfully solved. The way was made clear for devotees to take up the motor cycle in their thousands.

Few readers can appreciate what 100,000 really represents. It is nearly as big as the British Army of old contemptibles which did so much to stem the Hun hordes in September, 1914.

Twenty tons of paper are consumed in the ordinary weekly circulation. Even the tiny wire used for stitching the pages together is used at the rate of nearly four miles per week.

Rotary printing machines (of which six are installed)—even more wonderful in design than our motor cycles—are used to print the journal. They are designed to reel off sixty-four page sheets at the rate of 6,000 copies per hour, counting, folding, and stacking them ready for collating and binding.

One Hundred Thousand Readers!

Imagine all of them mounted on motor cycles riding in single file. With a gap of only 5ft., they would form a procession over 220 miles in length.

If entered for an A.C.U. Trial and despatched at minute intervals, the competitors themselves would be strung out over 33,000 miles, or a distance equal to one and a third times round the world, and the officials with the starting watch would be busy for ten weeks without a break!

Again calculate the combined annual mileage of this number of motor cyclists each using two gallons of petrol per week. At an average of 75 m.p.g. the fuel used (over ten million gallons) would give 780 million miles of riding, or a distance more than equal to four double journeys between the earth and the sun, or over 31,000 journeys round the world.

1,250 Miles of Paper.

So much for one hundred thousand readers. Further figures directly connected with the production of one hundred thousand copies of *The Motor Cycle* are just as interesting. We find a normal week's issue stacked one above the other would form eight pillars as high as Niagara Falls, while the paper (exclusive of the cover) used in the recent Spring Number would form a ribbon, the width of *The Motor Cycle* and printed on both sides, reaching from London to Petrograd, a distance of 1,250 miles. To cover this distance a motor cyclist would have to ride at 20 m.p.h. without a stop for over sixty hours. Three such issues would more than bridge the Atlantic twice. The familiar blue paper used for the cover alone would stretch for a distance of thirty-four miles.

Through all the trials and vicissitudes that the industry experienced in the momentous years 1905 to 1911, and later when the industry assumed its present importance, the bond which existed between our readers and this journal is rarely observable between public and newspaper. From its earliest days *The Motor Cycle* has been so much a part of the movement that it has long since been regarded as the hub of the motor cycle world. When war broke out the journal itself, so to

speak, joined the Army. It proved its national value by obtaining over 10,000 recruits with special knowledge, and later chronicled the doings of those who helped so materially to win the war. Written by motor cyclists for motor cyclists, *The Motor Cycle* has won appreciation all over the world by its policy of fostering the motor cycle movement and providing interesting, helpful, and educative articles for the thinking man. Here it may be remarked that there is no keener motorist on the road than a motor cyclist—he is veritably part and parcel of his fascinating machine. Popularity may be judged by demand. In this connection, it is interesting to observe the rapid and consistent rise in our circulation figures during the past three months:

February 6th	...	67,253
February 13th	...	70,314
February 20th	...	72,881
February 27th	...	75,457
March 6th	...	80,301
March 13th	...	84,486
March 20th	...	89,433
March 27th	...	92,989
April 3rd	...	97,578
April 10th	...	98,643
April 17th	...	99,893
April 24th	...	100,935

A Record Demand for Motor Cycles—the Portent.

Quite apart from the perhaps justifiable pride we feel in the attainment of circulation figures of such magnitude, let us broadly consider its portent. One fact stands out prominently—the outlook for the pastime of motor cycling was never brighter. The interest in the sport and enthusiasm for the type of machines we all favour were never so pronounced. During the most prosperous period before the war the 100,000 mark was never reached, but in quick time since the Armistice that figure has been attained by *The Motor Cycle*, and the figures go on rising in a regular crescendo, as will be appreciated from an examination of the weekly totals published in this issue.

100,000!—

Manufacturers should take encouragement from the achievement. Already the conviction is growing in the motor car world that over-production is to occur when all the factories are in full swing next year. No such prospect is discussed in the motor cycle field, where the possibilities for the most economical form of motor vehicle are illimitable. Again, the British motor cycle possesses a reputation second to none Overseas, and were machines available many thousands could be shipped abroad immediately to fulfil long standing orders incapable of execution because the industry patriotically threw all peaceful production aside to assist in bringing about a successful termination of hostilities. Clearly the motor cycle industry is on the threshold of extraordinary developments, and the present demand for motor cycles, while abnormal when compared with pre-war standards, is bound to continue.

One of the large specially-built rotary printing machines upon which *The Motor Cycle* is produced. These machines are designed to print and fold a 64-page sheet at the rate of 6,000 copies per hour.

A New Automatic Carburetter.

A Three-jet Device with Single-lever Control to be known as the R.C.F.

THERE is a growing demand for an automatic carburetter suitable for motor cycle use, and in the R.C.F. we have one of extreme simplicity embodying several novel points.

The float chamber contains a spherical float which fits the chamber loosely and thus rises and falls with the petrol, cutting off the supply by means of the usual needle valve at the proper level. Below the float but above the passage to the

jets is a fine gauze filter, hemispherical in shape, extending over the whole base of the float chamber.

Two bosses projecting from the float chamber carry the mixing chamber, which consists of a horizontal cylinder, and the jets, generally three in number. Above the jets is a port which can be closed by the throttle and varied in area by an external sleeve having four different-sized apertures designed to provide a correct mixture under varying atmospheric conditions. Until the jets are uncovered by the throttle they are entirely outside the choke tube, and therefore subject to no suction from the engine. As the throttle opens the suction on each jet comes gradually into operation, and there is no dead spot. When any jet is uncovered there is no obstruction between it and the engine, even at small throttle openings. A stop is provided which can be set so as to allow the throttle to be closed only to a predetermined point. Thus the best position for starting and slow running can at once be obtained by fully closing the throttle lever.

We have one of these carburetters at present under test, and like its performance very well. The pick-up is excellent, and power good, but, as the carburetter has not yet been quite suited to our engine, the slow running leaves something to be desired, and we can as yet say nothing about the petrol consumption, and so shall refer to it again on a future occasion.

Elevation and sectional diagrams of the R.C.F. carburetter.

The R.C.F. carburetter fitted to a 3 h.p. Enfield.

AUTO CYCLE UNION NOTES.

(Officially communicated.)

INCREASING A.C.U. MEMBERSHIP.—There is no falling off in the number of applications for membership received at the headquarters of the Auto Cycle Union, and new members are joining at the rate of over 500 per week.

THE A.C.U. LIBRARY.—Members of the Auto Cycle Union are reminded that there is a comprehensive library of manufacturers' catalogues, which are

kept up to date, at the offices; and that these are available for personal perusal. In the event of a member desiring the catalogues of several firms, these will be sent by post on the understanding that they are returned to the A.C.U.

OFFICIAL BENZOLE TESTS.—The Auto Cycle Union is prepared to analyse samples of benzole for members who feel that fuel they have bought is not in

accordance with the standard set by the benzole companies.

SECOND-HAND MOTOR CYCLES.—The services of the Auto Cycle Union experts are available for the assistance of members buying second-hand motor cycles and cycle cars. The A.C.U. cannot undertake to purchase machines, but will advise prospective buyers whether to invest in any particular machine.

IDEAS: Useful and Ingenious.

Pyron R. Stone

Lubricating Bowden Wire.

A HINT for lubricating Bowden wires is submitted by Cpl. Oddy, from Belgium. He suggests that one end of a short length of rubber lamp tubing be placed over both inner and

Lubricating Bowden wire by means of a small piece of rubber tube and an oil gun.

outer cables, oil being forced into the other end by means of a small oil gun. Cpl. Oddy states that in a few seconds oil will emerge at the other end

An Anti-theft Lock.

MR. W. H. TRAILL sends a drawing of an anti-theft lock which has the advantage of locking the front wheel without any play such as exists when a chain is passed through the spokes, and which is liable to cause

Wheel lock suggested by Mr. W. H. Traill.

damage should the machine be moved with the wheel locked.

The suggested lock consists of strong eyelet lugs welded to the fork side members, and a steel loop riveted to the inside of the wheel rim, through which a steel pin may be inserted and secured with a padlock. It is advisable to fit two loops diametrically opposite each other, in order to balance the wheel.

Readers of "The Motor Cycle" are invited to contribute to this page any ideas successfully adapted to their motor cycles. Contributions will be paid for at our usual rates. Rough explanatory sketches will suffice

Emptying a Petrol Can without Waste.

A PIECE of $\frac{1}{2}$ in. or $\frac{3}{4}$ in. gaspipe soldered into the screwed cap of a petrol can and a small copper tube fixed as shown in the diagram will effectively pre-

A device to prevent waste in emptying petrol cans.

vent waste when emptying the petrol from cans into the tank. This little device can easily be carried in the toolbag.

A Simple Starting Vaporiser.

MR. W. ANSON, a Leicester reader, forwards particulars of a simple vaporising device to assist in starting with the heavier grades of fuel. It consists of a small brass union which is sweated into a piece of small bore copper piping, closed at the end, and provided with two very small holes diametrically opposite to each other. The device is screwed into the induction pipe and is used in conjunction with a petrol squirt to inject the fuel which is atom-

Vaporising jets in the induction pipe.

ised by its passage through the small holes. Mr. Anson states that heavy fuels never fail to give a quick start when vaporised in this manner.

Fixing a Tank.

A SHEFFIELD reader—Mr. W. H. Beresford—having had trouble with petrol leaking from his tank via the holes for the screws which secured it in position, overcame the difficulty by strapping the tank on to the frame by means of sheet steel strips tightened by $\frac{1}{4}$ in. bolts. At the top of the bands short

A strapped-on tank.

pieces of steel were bent to follow the half circumference of the top tube and riveted to the straps, thus preventing any possibility of the band twisting round.

Between the bottom of the tank and the lower tube of the frame our correspondent inserted three-ply wedges.

A Convenient Work Stand.

MOTOR cyclists who have adjustments and repairs to make to their machines know the advantage and desirability of having the machine raised off the floor. In the average motor cycle shed, however, there is rarely sufficient

Details of a portable work stand.

room to store a permanent work stand when it is not in use, hence the suggested "portable" stand illustrated here may appeal to those with limited space. The component parts of this stand are made from two mineral water cases, and a length of $1\text{ in.} \times 2\frac{1}{2}\text{ in.}$ wood about 6 ft. long. The necessary alterations to the cases and general details are of such a simple character that any motor cyclist could make the stand.

THROUGH FEMININE GOGGLES.

Where are the Ladies' Models?
Sidecar Machines Favoured.
Ex-Service Drivers in Reliability
Trials.

THE prospect of new models designed especially for our use appears scanty. Most manufacturers are concentrating on models for men, and, considering the proportion of women in the country as compared with men, this is rather surprising, unless it is assumed that a lady will ride the standard machine. In view of the limited output for the next few months, and the increased demand for the standard models, not many firms are listing an open-framed mount for the 1919 season. The Douglas manufacturers tell me that they intend making a few ladies' models later in the year.

Power for Sidecars.

We may give a sigh of regret for the little two-stroke ladies' Clyno that was just being perfected before motor cycle factories were converted to war purposes. This machine promised remarkably well, but, unfortunately, has been put aside for specialisation on their other two models. We hope that later on these designs will be brought forth again for those who have objections to the closed frame. There are still, however, plenty of good designs, allowing of a varied choice. Except for the veriest beginner, power enough to permit a sidecar to be attached is best for all-round purposes.

Most girls, who were war service motor cyclists, used $3\frac{1}{2}$ h.p. machines, and it is scarcely likely that they will be satisfied with a lower power when they select their own 'bus. In my opinion, it is always unwise to attach even a featherweight sidecar to a lightweight; there will inevitably dawn a day when the engine will be overdriven, and the wear and tear will be so much greater than with a machine having reserve power. The raw novice will be in a quandary as to which of the many excellent makes to purchase, but by studying the pages of *The Motor Cycle*, and bearing in mind that the lowest-priced article is not necessarily the cheapest in the end, one should be sure of umpteen miles of pleasure.

Many people despise the cane sidecar body, the coach-built being more fashionable and smarter in appearance, and possibly warmer for winter riding, but the two most comfortable sidecars I recollect were of cane con-

struction, one the standard Enfield of about 1913 and the other a Gloria with a sprung wheel. My passenger frequently wishes it were fashionable to have a cane sidecar still.

I am interestedly watching the types of mount favoured by the women who are to be demobilised. Having ridden in all weathers and conditions, the most proficient of these riders should put up a good performance in future reliability trials.

We are promised much in the way of comfort by spring frames, and improved engine design will conduce to ease of starting. The Raleigh people promise us a specification that should suit the lady driver. The thorn in the rose, however, is the high price quoted all round. One could have obtained a light car in earlier days for the price of a medium sidecar outfit of to-day, and this, too, just as petrol has become easy to obtain and promises to be of better quality. In a few years' time, when factories are in full swing, the output of motor cycles should be great enough to allow a substantial reduction in price, but for 1919 riding we must "pay the piper."

The Influence of the War on Dress.

The dress question should vex us no more, accustomed as we now are to a rational costume in many of the forms of labour undertaken by women. They, at any rate, will not be afraid to clothe themselves suitably to ride the only available motor cycles. There will always be some ladies who still have qualms about appearing in public in semi-masculine attire. Personally, I have never found it difficult to ride in skirts. The land army, the trench coats, and the sensible caps of the Women's Legion all offer suggestions which are very useful. The war has taught us much, and, among other

things, how to dress practically and becomingly. There is a greater selection now in any of the well-known stores, such as Dunhills, than some few years ago we could have found in all England. Scarcely any garb is proof against sixteen degrees of frost, so winter riding may not become very popular with women, but for spring, summer, and autumn we have everything that can be desired to make post-war motor cycling one huge success—save the machines. Mr. Manufacturer, *do* hurry up and get them on the market?

MAY WALKER.

Miss James, an enthusiast who believes in plenty of power.
Her mount is a 7-9 h.p. Premier.

COMPONENTS OF THE MOTOR SCOOTER.

Report upon the "Eveready" Autoped by an Eminent Engineer.

IT is probably true that fewer than a dozen people in this country know the mechanics of the American Autoped. We know that exorbitant prices have been paid by engineers interested in the motor scooter to obtain these details. Therefore, in view of the great interest manifested in this type of machine, the description and drawings we are able to give here and on page 463 are of more than usual interest to readers generally and prospective makers of scooters in particular.

An eminent engineer connected with the car and aviation industries has purchased one of these machines, and the drawings reproduced have been executed by his technical staff. They show in detail many points which have mystified would-be designers of motor scooters, and prove many assumptions regarding their mechanics to be wrong.

Full details of the transmission, clutch and brake mechanism, and the flywheel magneto, are clearly shown, together with a side elevation and plan, all drawn to scale.

Specification.

The following is the engineer's description and report upon the practicability of the machine.

(1.) ENGINE.—The single-cylinder engine is of 155 cubic centimetres capacity, with a bore and stroke of 56 x 63 mm. respectively, automatic inlet valve, mechanically operated exhaust valve. The engine is mounted on the left-hand side of and on the same axis as the front wheel, which is driven through a back gear and disc clutch, the gear ratio being 5.2 to 1. Cast iron cylinder, piston, and rings.

(2.) DRIVING MECHANISM AND FORECARRIAGE.—The engine crank case has a tubular extension, forming a support externally for the clutch operating mechanism, clutch driving gear, clutch discs and front wheel hub, and poles of the flywheel type magneto. Internally, the crank case extension carries the crankshaft, on the conical end of which is the flywheel containing the magneto magnets. The back gear bearings are also supported by the crank case, which, in addition, provides the lugs for the operating lever of the internal brake acting on the front rim. The usual front wheel fork is replaced by a frame formed of two sheet steel plates fitted to the top and extension of the crank case respectively, the upper part serving to carry the head of the frame and steering column or pillar, forming as a whole a complete forecarriage or power unit. Case-hardened steel gears and cone type ball bearings are used, with the exception of the main crankshaft bearing.

(3.) CONSTRUCTION.—Steel pressings are employed throughout. The steering column with its handle-bar is the only tubular member contained in the structure. Lateral stability remarkably good.

(4.) WHEELS AND TYRES.—Sheet steel disc type, fitted with 15in. x 2½in. Goodrich tyres.

(5.) WHEELBASE.—35½in.

(6.) BRAKES.—Fibre-lined shoe or band, engaging on internal surface of extension of the front wheel rim, controlled by the rearward motion of the steering column.

(7.) CARBURETTER.—Primitive jet and pipe arrangement, remarkable chiefly for its inefficiency and reluctance to work. Substitution of carburetter of approved type is essential. Diameter of inlet pipe ⅝in.

Controls and Comment.

(8.) CONTROL.—The front wheel brake and the disc clutch are connected to the steering column by means of links and rods, and operated by the forward or rearward motion of the steering column. The maximum forward position of the steering column is controlled by a stop, which provides a location for the actual running position when the clutch is fully engaged and the brake fully released. A slight rearward motion of the steering column disengages the clutch, providing a free engine, while a further rearward motion brings the front wheel brake into action. Throttling is effected by a varying degree of lift of the inlet valve, actuated through a Bowden wire from a twisting grip of the handle-bar. The ignition is fixed, and no switch is fitted. It is considered that the arrangement of control leaves much to be desired. Separation of the interconnected clutch and brake is regarded as essential, and the incorporation of variable ignition and an exhaust valve lifter is very necessary.

(9.) WEIGHT.—Completely equipped as delivered, 96 lb., of which 76 lb. is contributed by the power unit or forecarriage.

(10.) CONCLUSIONS.—The Autoped may be regarded as a handy single-track automobile strictly for runabout use. Continuous journeys up to ten miles are made without fatigue under ordinary road conditions. It can be used, and successfully handled, on short journeys under conditions and in situations that are seen to be inconvenient or impossible with an orthodox motor cycle, and it is found that the facilities with which this machine is handled under such conditions are restricted by the addition of a seat or saddle. The steadiness and cleanliness of the machine under adverse weather condition leave nothing to be desired.

With the few modifications named it is considered that the machine in its present form is ideal for the purpose it serves, and it may be regarded as the most usable and manufacturable design so far published.

It is found that the machine appeals to all classes of a large public to whom the orthodox motor cycle is not attractive, and it is felt that the very large demand that undoubtedly exists for this class of vehicle would have no influence on motor cycle sales.

COVENTRY AND WARWICKSHIRE M.C. MANVILLE CUP TRIAL.

ON the 24th inst. the valuable trophy known as the Manville Cup, and named after the donor, the president of the club, Mr. Edward Manville, M.P., will be competed for by members of the club.

The event will take the form of a non-stop trial over a course of 81 miles. There will be an interval of one hour for tea, which will be taken at the Round Tower, Edge Hill, the start and finish being on the outskirts of Coventry. Included in the event will be a stopping and starting test on a hill. There will be only one secret check in the trial, which will be used to decide the winner in the event of there being a tie.

The premier award will be held for one year by the winner, in addition to a permanent prize.

CLASS 1.—SOLO.

- A. Up to 350 c.c.
- B. Up to 550 c.c.
- C. Up to 1,000 c.c.

CLASS 2.—SIDE CAR OUTFITS.

- A. Single-cylinder sidecar outfits.
- B. Multi-cylinder sidecar outfits.

CLASS 3.—CARS.

- A. Cars with engines not exceeding 1,500 c.c.
- B. Cars with engines exceeding 1,500 c.c.

Provided that there are not less than five starters in a class, the winner of the class will receive a prize.

The entry fee for the trial will be 5s., and anyone wishing to join the club for the event must send in his name, together with club subscription of 10s., to the hon. secretary, Mr. M. F. W. Sampson, 19, Hertford Street, Coventry, not later than May 17th.

Entries for the trial, which must be accompanied by the 5s. entrance fee, should be sent to the trial hon. secretary, Mr. J. F. Spencer, Priory Street, Coventry, from whom the rules governing the event may be obtained.

A large number of entries are expected.

Plan of Eveready Autoped.

THE TWO-STROKE ENGINE.

Lines of Development in Competition with the Four-stroke.

JUDGING by the sudden increase of its numbers on the road just prior to the war, the two-stroke motor cycle claimed an undoubted popularity in a certain section of the motor cycling community. Its devotees primarily, I think, sprang from the ranks of lightweight riders and the fair sex. Since then it has proved itself a reliable little mount, and more than useful where speed was not the first essential, though from consideration of design with our present knowledge no attempts have recently been made to put on the market a larger engined machine to compete with the four-stroke types.

Although superficially the two-stroke is by far the simpler engine, it is really more complex from the designer's point of view than the four-stroke. The details of its design are positively crowded with unsatisfactory compromises—advantages balanced against disadvantages all the time. One of the principal requirements of the two-stroke is a good mixture at all speeds, which is never obtained in practice. Nevertheless, in the better-known models now marketed these defects are so minimised that they make quite a good showing compared with the four-stroke models, and are immeasurably more comfortable to ride than four-strokes having a similar number of cylinders.

The principal points considered by the average purchaser of these machines are the smooth running, extremely easy starting, even torque (making it safe to ride on greasy roads), an attractive exhaust note—whether this would apply in larger models remains to be seen—and the absence of valve clatter.

Theoretical Advantages.

Naturally the fundamental advantage of the two-stroke over the four-stroke lies in the fact that a higher power output is obtainable per c.c. Theoretically this increase should be 100%, as there are twice as many power strokes for an equal number of revolutions. Up to the present, however, it cannot be claimed that any two-stroke has attained this superiority, 20% extra power being nearer the mark. Another equally important advantage is derived from the fact that an impulse stroke

is obtained every revolution, against every other revolution of the four-stroke. This even torque results in a much better pulling power and a big reduction in the strains to which the engine, transmission, and frame are put.

The ordinary type which we are considering is remarkably simple in the number and construction of its working parts—it is, indeed, the most simple design of engine in existence, there being only three moving parts (piston, connecting rod, and crankshaft). This fact largely discounts the advantages which are possessed exclusively by the four-stroke. To go to the other extreme, there is no reason why a two-stroke engine more complicated in design than the conventional type, even embodying as many parts as the four-stroke, should not successfully compete with the latter, provided that its own special advantages are exploited to the full. Those two-stroke designs, providing a charging pump

of larger capacity than the cylinder volume swept by the piston, allow of the whole compression space to be utilised to the fullest advantage and the h.p. increased accordingly—and more than make up for the power lost on the opening of the exhaust port. The majority of two-strokes also possess most compact combustion chambers, which make for higher thermal efficiency. A big recommendation, too, is their flexibility, rendering the employment of an extensive gear range unnecessary.

Fuel Consumption.

But a second gear ratio is desirable, as the complaint of inflated fuel consumption usually comes from those who tune their machines to climb any main road hill on a single gear. This usually means that a large jet is fitted, with consequent high petrol consumption. It is generally found, however, that a two-stroke machine tuned to give only the same hill-climbing capacity as a four-stroke is quite as economical as the latter type, from 100 to 130 m.p.g. being obtained with engines of 250-300 c.c. capacity.

The power which is used to compress the fresh charge of mixture in the crank case is obviously wasted as it expands again while entering the cylinder. Some designs increase the power by a special

The Rowe engine, a two-stroke with truncated pistons, the lower halves of which act as charging pumps. Mechanically-operated exhaust valves are incorporated.

The conventional type of lightweight two-stroke engine, a Levis.

The Ricardo engine, having a separate charging pump, the idea being to overcome scavenging defects.

The Two-stroke Engine.—

transfer arrangement, enabling the pump to surcharge the working cylinder.

Another weakness in conventional two-stroke design is the reduction of the effective stroke by the opening of the exhaust port, causing a rapid fall of pressure, also the fresh charge cannot exceed the volume contained above the top of the exhaust port, and some of the mixture is generally lost. Then, again, the running is liable to be somewhat erratic when throttled down, with a consequent loss of the power of acceleration. Two other two-stroke weaknesses are the carbonising of the top ring and an objectionable "rattle."

However, most of these troubles can be much reduced. It will be seen, therefore, from this *resumé* of the pros and cons of the two-stroke engine that much pioneer work still remains to be done before it can compete, with any hope of success, with the highly-developed four-stroke type for engines of larger size than the lightweight. That it has possibilities must be admitted, as witness the immediate popularity of the more successful designs, and it only needs careful consideration, experience, and attention to detail to bring it to a commercial footing equal to the poppet-valved engine in every respect as a power unit for the sidecar motor cycle.

MASCOT.

QUALITY AT MINOR POINTS.

On the Policy of including Bought-out Fittings in the Motor Cycle Guarantee.

DO manufacturers submit proprietary fittings to proving tests to satisfy themselves that such components are of a quality that will enhance their reputation? On first thoughts one would say the answer to this question is self-evident, and that no manufacturer would knowingly risk his reputation by fitting to his machine articles of unproved quality.

On the other hand, experienced motor cyclists will call to mind many annoyances—petty and otherwise—the possibility of which could have been greatly minimised by a thorough proving on the part of the cycle manufacturer of the articles concerned.

Increasing Prestige.

By the omission of a few simple tests the reputation of a machine is often jeopardised, and it would appear questionable policy to run such risks with any machine, irrespective of its price.

It is common practice to exclude from the selling guarantee of a machine the specialities manufactured by another firm. Would it not be much more valuable as a selling proposition to include in the guarantee the whole machine and fittings, without any exception?

The onus of fitting reliable units would fall wholly on the manufacturer, and the cheap shoddy fittings on the cheaper grade of machine would disappear.

Each firm should thoroughly prove to

its own satisfaction that the articles fitted to its machines are of a good quality, and the motor cycle industry would greatly benefit in prestige as a result of the increased reliability, and of the longer wearing qualities throughout.

A Proving House.

It is, of course, appreciated that small firms could not maintain the requisite staff and equipment for submitting the various specialities to rigorous tests, and probably the best solution lies in the founding of a proving house for every conceivable fitment made use of by the motor cycle manufacturer. Unquestionably, such an institution would be invaluable as an aid to the development of the motor cycle, although it need not necessarily be confined to the motor cycle or any particular branch of the engineering trade, but rather exist as a national trade institution.

Some of the items which should be submitted to these tests are magnetos, high-tension cables, tool bags, saddles, sparking plugs, chains, carburettors, controls, proprietary lubricating devices, compression taps, petrol taps, belt fasteners, etc. Only by the continued testing and proving can the quality of manufactured goods be maintained and improved, and by the full use of these means will the evolution of the perfect motor cycle be accelerated. A.E.

SIDECARRING IN HERTFORDSHIRE.

A ford across the river Ver, whence is derived Verulamium, the old Latin name of St. Albans. The outfit is an 8 h.p. Matchless.

Motor Cycles from £16 to £150.

Another Auction Sale of Used Machines.

HIGH prices were again the rule at a sale of privately-owned and U.S.A. Army motor vehicles held by the Auction Department of the Grahame-White Co. at Hendon on the 29th ult. Among the privately-owned vehicles were a few motor cycles. Sandwiched in among the cars was a $3\frac{1}{2}$ h.p. 1913 Premier with a Supreme coach-built sidecar, two-speed countershaft gear, just overhauled and newly painted, which went for the very high price of £60.

(Left) The auction in progress. Keen interest was manifested in the Enfields. (Right) An American soldier explaining various points of the machines to interested spectators.

While at the sale we met H. F. Edwards, formerly a member of the M.C.C. Committee, who bought two Enfield combinations at £120 each. He was discharged from the Army last autumn, after having had long service with the M.T., and having been blown off his motor cycle by a shell.

The next motor cycle on the list was a 1911 single-cylinder Kerry, of very ancient appearance and with automatic inlet valve. This brought £16, while a 1911 7-9 h.p. two-speed Indian, minus a silencer, rather a racing-looking mount, was sold for £19 and appeared to be cheap. The next motor cycle put up was described as a 1911 $2\frac{1}{4}$ h.p. Calthorpe. This had a 2 h.p. Precision power unit with a Dixie magneto, and appeared to be a 1914 model. Although the rear brake was missing, this was sold at £20.

A Mixed Lot.

Among the U.S.A. Army motor vehicles were a number of motor cycles in excellent condition, though there were a few exceptions. One of these was a New Imperial motor cycle and sidecar with gear box removed, forks twisted, footrests bent, and was generally in poor condition, which was sold for £44, while a similar machine with sidecar wheel buckled, front forks twisted, and many parts missing was sold for £57. Properly regarded as among the scrap was a Matchless motor bicycle and sidecar, the front cylinder of which was missing and the piston broken, which fetched £80. Next followed four Douglasses and sidecars which went for £90 each, and then came seven Royal Enfield motor cycles and sidecars, which were eagerly snapped up. The first, after the bidding had started at a fairly low figure, was knocked down at £135, while for the next the bidding started at £100, and it was sold for £110. The highest priced Enfield fetched £150.

The last of the machines to be put up for auction were ten Enfield sidecar combinations, which fetched from £115 to £125, one of the most expensive being without a chain.

THE POLICE AND REGULATIONS.

THERE is a great deal of police persecution at the present time against motorists of all classes. Motor cyclists are being prosecuted, not only for exceeding the speed limit, for having dirty number plates, irregular lights, and other causes, but for not having two independent brakes. The police seem quite at a loss to interpret the regulations correctly, and think that the only system allowed is when there is a front wheel brake and a rear wheel brake. Any motor cyclist whose mount conforms to the regulations, and yet has been summoned, is asked to communicate with the Secretary of the Auto Cycle Union, 83, Pall Mall, London, S.W.1.

A Matchless outfit with broken cylinder that sold for £80.

CURRENT HAT

Times to Light Lamps.

SUMMER TIME.			
May 8th	...	9.0	p.m.
" 10th	...	9.3	"
" 12th	...	9.7	"
" 14th	...	9.10	"

92.5 m.p.h.

A speed of nearly 92½ m.p.h. was attained recently by Ray Creviston, riding an eight valve Indian, over a five mile course in Portland Oregon.

Police Activity in Surrey.

While the Surrey police are pretty good as regards not trapping in the open country, they are very active in towns, especially in ten-mile speed limits. In Farnham the other day a motor cyclist was fined for travelling at from twelve to fifteen miles an hour. Traps in the open country in Surrey are to be found only in districts included in the Metropolitan Police area.

French Motor Cycle Competitions.

Though the leading lights in the motor cycle world in France do not intend to go in for serious competitions this year, the Competitions Committee of the Moto-Cycle Club of France has decided to hold a touring trial over the Paris-Epernay-Rheims road, and back to Paris. The date and details will be fixed later, but it is likely that the trial will occupy a single day, and the average speed will be 20 m.p.h. for solo mounts and rather less for sidecar machines. There will be a hill-climb on the course. The trial will be held subject to the approval of the French Moto-Cycle Union.

London-Edinburgh Entries.

It is anticipated that this year's London-Edinburgh run will attract a record number of entries. The following have already sent in their entry forms:

E. Bridgman (7 Indian s.c.).
Rex Mundy (8 Matchless s.c.).
Jas. McKenzie (6 w.c. Humber s.c.).
A. Mabon (4 Mabon s.c.).
W. A. Fell-Smith (7 Harley-Davidson).
E. M. P. Boileau (3 A.B.C.).
W. Cooper (—).
A. Candler (15 Rover car).
C. J. Myson (10 Singer).
W. C. Henry (2½ Metro-Tyler).
W. H. Wells (25 Overland car).
A. Noble (10 A.C.).
W. G. Brownson (10 A.C.).

Opening Run of the Streatham and District Motor Cycle Club.

After a week more like January than May, the weather was reasonably fine for the opening run of the Streatham and District M.C.C. to Clayton Arms, Godstone, last Saturday. The attendance was fairly good, about forty being present. More would have been there but for the late delivery of new models, many members still being without machines. This same reason accounts for the small number of cars present. A few of the old Streatham members were in attendance, including W. Pratt, the old P. and M. rider, now in "civvies," but, we are sorry to say, still on crutches. He was wounded about eighteen months ago, and, as he is still under treatment, it is doubtful if he will ride much this year. Other members present were the Hunter brothers, Messrs. Boutle, L. Barratt (chairman of the club), Bateson, Hine, and C. A. H. Mason.

Special Features.

COMPONENTS OF THE MOTOR SCOOTER.
SPRINGING THE MACHINE.

Bad Roads in Liverpool.

A Liverpool doctor calls our attention to the disgraceful state of the roads in certain parts of Liverpool, particularly in side streets, where the surface is frequently strewn with broken bottles and other refuse dangerous to motor cyclists.

No Super-tax on Petrol after the 17th.

In reply to a question by Mr. Joynson Hicks, Mr. Chamberlain, the Chancellor of the Exchequer, announced in the House that he hoped "the duty will go on the 17th of May, and the Petrol Control Department very soon afterwards."

French Two-stroke Cycle Car.

A new cycle car, to be known as the Sicam, and fitted with a two-cylinder two-stroke engine (65 mm. x 75 mm.), and cooled by means of a fan, will shortly appear on the French market. The transmission will be through a cone clutch, the final drive to the rear wheel being by belts over expanding pulleys. The vehicle will be sold complete with hood, screen, and electric lighting for approximately £140.

Victory Cup.

Mr. K. A. Gilmour, the Australian rider, who entered the Victory Cup Trial at the starting point rode a Villiers engined machine made by Messrs. R. Walker and Son, of Tyseley, Birmingham.

The Streatham and District M.C.C. revived. Members who attended the opening run to Godstone last Saturday.

Service Men in Birmingham M.C.C. Trial.

Fifty per cent. of the entrants for the recent Victory Cup Trial were members or ex-members of H.M. Forces.

Cheaper Petrol.

This month motor cyclists may confidently expect a tardy, though none the less welcome, reduction in the price of petrol.

Whose Gloves?

If the air mechanic riding a Blue Indian, who assisted a Rudge rider in trouble with his magneto near Orsett Cock, will send us his address the gloves he left behind will be returned to him.

A Novel Use for the Sidecar.

Near a riverside resort we saw recently a light racing outrigger skiff being transported a distance of some eight miles through traffic and country, turned upside down on a sidecar chassis. With about twenty feet of a delicately built shell sticking out fore and aft, the driving in traffic was a very ticklish matter.

Complaints.

We understand from the A.A. and M.U. that complaints have been received from residents in Maidenhead regarding the speed of motorists in that town, and that unless drivers more scrupulously observe the speed limit through Maidenhead, the police authorities will take action. Another complaint which has reached the Association relates to the increasing use of open cut-outs in the neighbourhood of Prince's Gate.

Disfiguring Road Signs.

The Royal Automobile Club's campaign against the disfigurement of the countryside by huge posters and other objectionable advertisements is meeting with considerable success. The well-known Scapa Society is working with the Club to induce local authorities to use the powers conferred upon them by the Advertisements Regulation Act of 1907. To save these authorities time and trouble a model set of byelaws accompanies the explanatory memorandum sent to them. These byelaws comprise the forms and embrace the modifications or extensions which have from time to time received the approval of the Secretary of State.

The Industrial Reconstruction Council.

A conference on "Costing in Relation to Scientific Management" will be held under the auspices of the Industrial Reconstruction Council on Tuesday, the 13th inst., at 5.30 p.m., in the Hall of the Institute of Journalists, 2 and 4, Tudor Street, E.C.4. The chair will be taken by Sir Herbert Austin, K.B.E., and the address given by Mr. J. H. Boyd (Director of Costs and Efficiency Methods, Central Stores Department, Ministry of Munitions). No tickets are necessary.

The third lecture of the series arranged by the Industrial Reconstruction Council will be held in the Saddlers' Hall, Cheap-side, E.C.2, on Wednesday, the 14th inst. The chair will be taken at 4.30 by Sir Lynden Macassey, and a lecture on "The Economic Limits of Nationalisation" will be delivered by Brig. General Cockerill, C.B., M.P. Applications for tickets should be made to the Secretary, I.R.C., 2 and 4, Tudor Street, E.C.4.

Note to Readers.

Readers are requested when writing to *The Motor Cycle* to comply with the instructions to be found each week at the head of "Letters to the Editor" and "Questions and Replies." Neglect of this causes delay and unnecessary trouble. Letters should be sent to Coventry, queries to London.

Mr. S. L. Bailey.

The well-known Douglas manager is suffering from the effects of a car accident which occurred near Bath during Easter. He must perforce attend to his duties one-handed for the next few weeks, otherwise he came off luckily.

French 1919 Models.

The firm of Terrot will concentrate on two types—a single-cylinder 2½ h.p. and a 4 h.p. twin. The single-cylinder has an engine 67×90 mm. and a variable pulley gear, price £72; while the twin is fitted with a two-cylinder engine, 64×97 mm., and a three-speed gear box and plate clutch, price £128, sidecar £38 extra.

The Revival of Motor Cycle Clubs.

There seems to be no doubt that the progress in the revival of motor cycle clubs is being considerably hampered by the non-delivery of new motor cycles. Many members are anxious to join clubs as soon as they can get delivery of their new mounts, and until they do they naturally do not see the point of sending in their subscriptions.

This is clearly the case with that sporting little body, the Public Schools M.C.C. The hon. secretary is in communication with numerous prospective members, but it is heard on all sides that few will join until they have something to ride. This fact led to the postponement of the hill-climb which was to have taken place on April 26th to a date which will be fixed later.

A Bosch Motor Cycle?

The Douglas firm are proud to find that amongst many items of interest which came to light after the Armistice is the fact that the Huns, having captured a Douglas electric power generating set, produced an almost exact copy under the name of the Bosch, presumably made by the magneto firm. So near a copy did they make that many parts of the flat twin engine are interchangeable with Douglas parts. Does this herald an attempt at a German flat twin motor cycle?

Patent Rights and the Enemy.

The previous paragraph leads one to wonder whether the peace terms are sufficiently comprehensive to include arrangements for the satisfactory settlement of the question of Allied and enemy patent rights. Will the German firms be allowed to continue infringing English patents after peace is signed?

1919 Dene Models.

The Dene Motor Co., Newcastle-on-Tyne, are specialising for this year upon the production of a big twin machine. The specification includes 8 h.p. V Jap engine, with Blic magneto behind engine, driven by chain from engine shaft. This design is a distinct "breakaway" from standard, and brings the contact breaker to the right hand side—a great convenience in sidecar machines. Transmission is by 5in. × 3in. Renold chain through Sturmey-Archer three-speed countershaft gear. Chains are enclosed in cast and machined aluminium cases. Back wheel quickly detachable and fitted with buffer drive to eliminate shock. Dunlop tyres, 28in. × 3in. Brooks saddle. The hubs are carried on Hoffmann journal bearings. The brakes are of the belt-rim type with compensating shoe operating inside the rim. The price will be £130. The firm also markets a 4 h.p. chain-cum-belt-drive model, the price of which is £95.

The utility and value of motor cycles for municipal service are beginning to be appreciated by city and town councils in this country, and in America they are used very extensively by police and other municipal bodies. The photograph given above depicts a 7-9 h.p. machine used by a fire department.

CLUTCH ADJUSTMENT

Excessive Pressure
a Common Cause of
Trouble.

HOW many motor cyclists thoroughly understand the working and adjustment of the clutches with which their machines are fitted? Quite a small percentage, I venture to think. To anyone it is clear that increasing the tension of the springs increases the gripping capabilities of the clutch, and there is a very large section of riders which, experiencing clutch troubles, at once flies to the all-important spring as the slacker of the moment. The result is that the average clutch in the hands of the average rider suffers from much higher spring pressure than would be necessary had the unit received that intelligent attention which its function and situation in life deserve.

On medium weight machines the gripping qualities of the clutch leave so wide a margin for the inefficiency of the rider that, in the case of an efficient rider—i.e., the man who understands his clutch inside out—the very lightest adjustment is sufficient for normal needs. For instance, I have myself possessed high-speed twin-cylinder machines of $3\frac{1}{2}$ h.p. or thereabouts fitted with gear box and clutch units of the same make and type as those similarly fitted to machines up to 8 h.p. On the $3\frac{1}{2}$ h.p. high-speed machine the pressure on the plates could obviously be reduced to about half that necessary for the 8 h.p., and considerable advantages were obtained by easing off the springs accordingly—especially if the clutch were hand-controlled.

Saving the Gear Box.

It may be taken as a safe rule to ride with the clutch as lightly adjusted as the load imposed upon it permits—avoiding, of course, clutch slip when ascending a stiff gradient on top gear. If the clutch does not slip under such conditions, or when starting up cold with the kick-starter, one can feel assured that no slip to trouble about is occurring on the lower ratio and therefore that there is little or no danger of burning the clutch out through too light an adjustment.

At all events, even though sufficient slip occur to warm the plates perceptibly during a period of stiff high-gear riding, this fact merely goes to prove that the clutch is performing the function it should perform. New plates are cheaper than repeated rear tyre and chain renewals, and certainly cheaper and less distressing than gear box troubles. It will come as no surprise to Overseas riders that gear box troubles have proved by no means a rarity on military machines serving under the conditions of the battle front, and that half these troubles are duly traced to the zealotry of the rider in guarding against clutch slip by screwing his springs fully, or almost fully, home—result, a clutch which is never quite free, or which

takes so much hauling out that a good deal of gear changing occurs with the engine under load.

Modern clutches will stand any amount of intelligent slipping, and if carefully kept and carefully adjusted they should function not only in the ordinary sense, but also as shock absorbers, thereby saving transmission, tyres, engine, and indeed the machine throughout. One would seriously recommend riders who do not feel themselves entirely *au fait* with the clutch they use to make a point of mastering this unit, as upon it depends the reliability of the mount. Often at the end of a year or so a gear box gives out or a frame breakage occurs or spokes yield or the engine develops a knock; the part that goes is condemned as weak, whereas the sole weakness lies in the rider in that he has not understood, and in his ignorance neglected, that all-important unit—the clutch.

Adjustment.

So much agreed then, a word or two on arriving at the proper adjustment may be of help. It is really a job to be done by the correction of road test—a job for the skilled tester—but with a little sound judgment and the application of a small amount of mechanical commonsense, rule-of-thumb tactics can be successfully applied.

The rough and ready rule of thumb is that an engine develops power more or less in proportion to that required to jerk it over compression by the application of the hand to the back wheel. Therefore, jack the machine on the stand, and ease off the clutch till perceptible slip is obtained when trying to jerk the engine over in the manner described. Tighten up the clutch slowly till no slip whatever is perceptible under the most violent jerk, then give the adjustment another half-turn for luck. When next hieing forth, watch carefully for clutch slip, and should it occur tighten up till it is eliminated. Do not forget that no amount of tightening will achieve the results desired unless the plates are in reasonably good order and the push-rod adjustment as it should be. Look out for this push-rod! It is a snare and a delusion for the unwary.

CHINOOK.

A new method of denaturing spirit has been patented which has the advantage of being comparatively cheap. The denaturant, which is obtained from the distillation of turpentine, is specially suitable, as spirit treated with it possesses an extremely disagreeable smell and flavour, but is not so poisonous as spirit denatured with methyl-alcohol. The value of a satisfactory denaturing method is great, as it is a point which will influence the authorities in releasing alcohol for fuel purposes.

Ripon and District M.C.C.

This club restarts under healthy conditions, and there seems to be every prospect of future prosperity.

Widnes M.C.C.

The Widnes Club promises to be a great success; the membership is increasing every week. Local motor cyclists desiring to join a club should communicate with the hon. secretary, Mr. A. J. Bailey, 57, Regent Road, Widnes. The next run is on the 11th inst. to Blackpool.

Wallasey Motoring Club.

At a meeting held recently, the above club was formed, and the following officers elected: Hon. secretary, Mr. A. W. Garnett; hon. treasurer, Mr. J. Huntington; committee, Messrs. Hargreaves, H. Williams, and J. Jones. Local motor cyclists interested should communicate with the secretary.

North Birmingham A.C.

The above club will hold an opening meeting at 7.30 to-morrow (the 9th inst.) at the headquarters, Acorn Hotel, High Street, Erdington, and invites all motor cyclists and motorists who are interested to attend. A long programme of competitions and social events is to be discussed. Hon. sec., Mr. H. J. Moseley, 384, Slade Road, Erdington; assistant hon. sec., Mr. F. W. Thrush, 34, Reservoir Road, Erdington.

Luton and Beds. A.C.

The Luton and South Beds. A.C.C. has been revived under the name of the Luton and Beds. A.C., and the opening run will take place on Saturday the 17th May, starting at 2.30 p.m. from the Luton Town Hall. Any motor cycle and car owners in the district are cordially invited to attend. Full particulars can be obtained from the hon. secretary, Mr. Geoffrey S. Davison, 16, Bute Street, Luton.

Motor Cycling Club.

The M.C.C. is holding its first club competition—a speed-judging contest on Saturday next. There will be two classes, viz., for solo machines and passenger machines. The start will be made from a spot in the neighbourhood of Potters Bar at 3 p.m. A circular course of about five miles is to be covered three times. The first circuit at 16½ m.p.h., the second at 18½ m.p.h., the third at competitors' own choice of speed, not less than twelve nor more than twenty miles per hour. At the completion of the three laps competitors will state their chosen speed on a card (given to them prior to the event) and hand it to the timekeeper. Club prizes will be awarded to the best performances in each class, provided the entries are sufficient. The results will be announced at the Salisbury Hotel, Barnet, where it is hoped that arrangements will be made for tea.

Future Events.

May 9.—North Birmingham A.C. Opening Meeting, Acorn Hotel, Erdington, at 7.30 p.m.

May 9.—Bristol M.C.C. G.M., Grand Hotel, Broad St., Bristol, at 7 p.m.

May 10.—Bristol M.C.C. Rally.

May 10.—Exeter and District M.C.C. Opening Run.

May 10.—The M.C.C. Speed-judging Competition.

May 10.—Middlesbrough and District M.C. Run to Riccarton Abbey.

May 10.—N.M.C.F.U., Leeds. Run to Ilkley.

May 10.—Sheffield and Hallamshire M.C.C. Speed-judging Competition, Mam Tor.

May 10.—Wolverhampton M.C.C. Reliability Trial for the Corke Cup.

May 11.—Carlyle C. and M.C. (Chelsea). Run to Mersham.

May 11.—Eastern Counties M.C. Run to Southend.

May 11.—Ilkeston and District M.C.C. Run to Ollerton.

May 11.—N.M.C.F.U., Leeds. Run to Harrogate.

May 11.—N.M.C.F.U., Sheffield. Run to Dovedale.

May 11.—North Derbyshire M.C.C. Run to Castleton.

May 11.—Rochester, Chatham and District M.C. Run to Tunbridge Wells.

May 11.—Widnes M.C.C. Run to Blackpool.

May 13.—Oldham and District M.C. Hill-climb, Booth Dene.

May 14.—Middlesbrough and District M.C. Run to Stokesley and Saltburn.

May 15.—Tredegar and District M.C. Hill-climb at Fiddler's Elbow.

May 17-18.—Birmingham M.C.C. Weekend Touring Competition to Llangollen.

May 17.—Liverpool M.C. Social Run to Llangollen.

May 17.—Luton and Beds. A.C.—Opening Run.

May 17.—N.M.C.F.U., Leeds. Invitation Run to Keadby.

May 17.—Sutton Coldfield A.C. Half-day Trial for Levis Cup.

May 17.—Woolwich, Plumstead, and District M.C.C. Open Trial for Matchless Cup.

May 17.—York and District M.C. Paper-chase.

May 18.—Carlyle C. and M.C. (Chelsea). Run to Dorking.

May 18.—Eastern Counties M.C. Run to Bedford.

May 18.—Ilkeston and District M.C.C. Run to Surfleet.

May 18.—Woolwich, Plumstead and District M.C.C. Picnic Run to Limsfield.

May 21.—York and District M.C. Reliability Trial.

May 24.—Coventry and Warwickshire M.C. Manville Cup Trial.

Essex M.C.

It has now been decided definitely to run the speed trials at Southend, which will probably take place at the end of June. An open hill-climb is also being organised, as well as the usual twenty-four hour competition to York and back. Full particulars will be sent to members shortly. At Whitsun a midnight ride to Yarmouth will take place in the form of a competition.

Manchester M.C.

This club held a members' special general meeting at the Crown Hotel, Booth Street, Manchester, yesterday (Wednesday), to elect officers and committee, and arrange the full programme for 1919. Subscriptions for 1919 are now overdue, and should be paid to the hon. treasurer, Mr. G. B. Walker, 58, King Street, Manchester.

Birmingham M.C.C.

The Birmingham M.C.C.'s touring trial on the 17th and 18th inst. is now arranged, and the rules and regulations may be obtained from the hon. sec., Mr. W. H. Egginton, 76, Earlsbury Gardens, Birchfields, Birmingham. There will be two classes: A for solo machines above 300 c.c. and passenger machines above 499 c.c., and B solo below 301 c.c. and sidecars below 499 c.c. Four special awards are offered, and silver medals will be awarded to all who are not more than five minutes early or late at any check.

Tredegar and District M.C.

A meeting of the above club was held on the 28th ult., when it was decided that the first fixture should be a hill-climb. This will be held on the Fiddler's Elbow between Gwalion and Blaenavon, distance three miles, on Thursday, the 15th inst., at 3 p.m., in the following classes: Solo, 4 h.p. or over; solo, under 4 h.p.; sidecar, any h.p. touring models. There will be three prizes for each class, and the entrance fee for members will be 1s. and non-members 2s. 6d. for each event. Entries should be sent to Mr. E. W. Sutherby, hon. secretary, Whitehall Buildings, Tredegar.

Bristol M.C.C.

A very successful meeting was held at the headquarters, Grand Hotel, Broad Street, Bristol, on Tuesday of last week. Mr. Roderick Fry was unanimously re-elected president, Lieut. H. Smith secretary, and Mr. C. W. Rankin assistant secretary. The election of the other officers was deferred until the next meeting, which will take place at headquarters on the 9th inst. at 7 p.m.

It was decided to hold a "rally" on Saturday, the 10th inst., members to meet at the Lamb and Lark Hotel, Keynsham, at 3.30 p.m. All motor cyclists will be welcomed whether they are members or not. Members are specially invited to attend.

100,000 A WEEK.

"Ixion's" Comments upon "The Motor Cycle's" Record in Motor Journalism.

HAVING contributed to *The Motor Cycle* since it was little more than a four-page journal, chiefly adorned by photographs of the pacing motor cycles used for assisting push bicycle records on the Continent, I naturally take a special interest in our publishers' announcement that we have smashed all records for the motor press in reaching a weekly circulation of 100,000 copies. The significance of such a figure is not easily recognised. Until August, 1914, the man in the street used it as the mathematician uses *n* to express an inconceivably large number. Thus we were told in 1914 that 100,000 Russians had landed at Wick, and were detaining at Dover, while I am not at all sure that my maiden aunt had not sunk 100,000 Hun submarines before the first war Christmas. Since then, what with the Kaiser's original notions of indemnities and the paper army corps of the Russian steam roller, and the unemployment dole, and the number of Hun spies who have been shot in the Tower, a hundred million strikes us as a mere bagatelle. One hundred thousand—unless it has the mystic sign "£" in front of it—only sounds extraordinarily impressive to the men who know. Being a journalist of sorts, the analogy which best represents the immensity of the figures to me is a comparison with daily newspapers. Some years ago a cynic with a liver remarked that Lord Northcliffe first wooed fame by inventing the *Daily Mail* for people who could not think; and, sighing for fresh worlds to conquer, subsequently produced the *Daily Mirror* for people who could not read (I safeguard myself from a libel action by hastily adding that I never miss an issue of either paper). Obviously the proprietor who caters for such a public has a large number to draw on—Carlyle, at any rate, would say so. By comparison we of *The Motor Cycle* appeal to a very select circle; for, speaking epigrammatically, we chiefly address amateur mechanics with £100 or so to burn. Yet the *Daily Mail*, with its galaxy of super-men on the staff, covering every possible interest in this world and the next, can only sell an edition just ten times as big as our own; and the *Daily Mirror*, which goes further towards relieving you of any necessity for an imagination of your own, disposes of a beggarly 900,000 odd copies per diem. Journalists know what a 100,000 circulation means.

What 100,000 Means.

You, gentle reader, not being a journalist can hardly esteem us at our real worth, unless you chance to have been a railway or shipping magnate in August, 1914, or perchance a quartermaster of the brass hat class. In that case you had to collect just about 100,000 members of the original Expeditionary Force, together with their impedimenta, and hustle them over to France. That job unquestionably taught all the staff concerned what 100,000 means. Perchance

you "follow" professional soccer, as the saying is, and are accustomed to the leviathan gates which the modern gladiator attracts. If so, it is still long odds you have never seen 100,000 of your kind assembled simultaneously; for 40,000 is still a bumper gate at a Cup-tie. Perhaps I had better abandon the job of trying to make myself realise what 100,000 is—I have never possessed 100,000 of anything except influenza germs. In a few years, when we touch the 200,000 mark, my successor's task will be much easier. The figure will doubtless approximate to the r.p.m. of Granville Bradshaw's latest engine, or to the mileage of one of F. L. Rapson's unpuncturable tyres, or the Triumph weekly output, or the Douglas speed in m.p.h. for a flying start mile at Brooklands.

In the Dark Days.

Joking apart, those of us who have fought the long battle have lived enviable years. We can remember days when our pages were hard to fill and harder to sell. Now we know what it is to reject lots of interesting copy, and even—in war-time—to repress an over-robust circulation because our paper ration would not run to it. We have seen punny little foreign engines of extraordinary capriciousness gummed to the down tubes of ridiculously bad British frames, and disfigured by incredibly silly transmissions. By trial and error, by research and experiment, by pluck, brains and energy, we have seen British motor cycles climb slowly to the very top of their industrial tree, and even threaten ethereal ideals. In the dark days of the industry other journals have gone under, but we have never missed a week. Over and above the material rewards of our present position we have three abiding memories to treasure. In so far as a journal can play a part in fostering and developing an industry, we can claim to have done yeoman service to maker, trader, and user alike. Our belief in the future of a machine which was once deservedly despised and mocked at has been more than approved by facts and history. Last, but not least, our bulging mailbags bring us quiet meeds of appreciation from all manner of men (and even women) in all the corners of the earth—from the tropics to the sub-Arctic regions.

One last word. When this paper was founded there was no motor cycling community. This country boasted nothing more than a handful of isolated enthusiasts, pursuing a strange and unpopular pastime. To-day the pastime has created a special community of enthusiasts within the bigger community of the State; indeed, it is an international community—as international as science, or finance, or Esperanto. As this journal has played its part in creating that community, so it still works to link its members together: and we of the staff are proud to share in the resultant freemasonry.

A Three-wheeler with Twin Rear Tyres.

New Runabout produced by a North of England Concern.

RUNABOUTS have come to be regarded as the real stepping stone between the sidecar and the car, and before the end of the year it is probable that several new machines of this type will be on the market.

Not the least interesting among these new runabouts is the M.B., made by the Premier Motor Co., of Bolton. It has an 85x85 mm. 961 c.c. water-cooled J.A.P. engine, flat plate clutch, two speeds and reverse gear box, with central gear change, shaft drive to gear box, hence by single chain, pressed steel frame, Dunlop pressed steel spoke wheels, and 650x65 tyres.

The rear wheel is somewhat unusual, twin tyres being mounted on independent wheels which are so arranged that they are built up into a single wheel.

The M.B. three-wheeled runabout.

A spare wheel is carried on the forward end of the left running board, which makes up the tyre equipment to five tyres—the same as on a light car.

Semi-elliptic springs are used at the

front and quarter-elliptic at the rear and the steering is by drum and steel cables. Complete with spare wheel and tyre, lamps, horn, jack, and tools, the price is £215.

The London-Edinburgh Run.

A Popular Whitsuntide Event that attracts Entries from Many Parts of the Kingdom.
Army and Navy well Represented.

THE rules and regulations of the twelfth annual club run of the Motor Cycling Club from London to Edinburgh have now been published. The start will take place as usual from the Old Gate House Hotel at the top of Highgate Hill on the evening of Friday, June 6th, at five o'clock. All competing motor cycles must be at the starting place at 7.30, and drivers must sign the checking sheet not later than 8 p.m. The vehicles will be started in the following order: first motor bicycles, then sidecar machines, then cycle cars, and finally cars. The actual order of starting will be determined by ballot. No driver will be allowed to leave any control before his schedule time. All motor cycles and other vehicles must be driven throughout the entire run

by the member entering, and members must accomplish the journey unaided by attendants riding on the machines or by organised assistance in any form. Under no circumstances may a passenger be seated on the carrier.

A gold medal will be awarded to every entrant reaching Edinburgh in 23 hours from the time of starting; a silver medal to an entrant finishing within 24 hours, and a bronze medal will be awarded to every entrant whose time exceeds 24 hours but who reaches Edinburgh within 30 hours. Entrants may not be at any place or time more than 15 minutes ahead of schedule, nor may entrants qualifying for gold medals be found at any place or time more than 30 minutes behind schedule.

Sidecars and cars must carry a passenger.

Applications to compete have been received from as far north as Fife, Carlisle, Newcastle, Warrington, etc., and the Services will be well represented. One entrant is a lieutenant in the Brazilian Navy.

The entry fee for all vehicles is £1 1s. No trade numbers will be allowed, nor any advertising device, other than the makers' standard transfer. All entries and entry fees must be sent to the trials honorary secretary, Lt. W. Cooper, R.A.S.C., M.T. Co., Claydon, Suffolk, before the 20th inst.

Lieut. W. Cooper will be pleased to hear from any motor cyclists who are willing to assist the committee by acting as marshals and checkers.

“Up and Down” Drive on Demonstration Machine.

One Way of reducing Wheelbase on Medium Sized Flat Twins.

IN order to demonstrate the 5-7 h.p. Victor flat twin engine unit which the Coventry Victor Motor Co., Ltd., are offering to the assembling trade, the makers have fitted it into a short wheelbase frame which has necessitated placing the gear box in an unconventional position.

As will be seen from the illustration given here, the gear unit is located above the rear cylinder in a position under the saddle. Thus the drive roughly follows two sides of a triangle.

It may be remembered we described this engine (which has a bore and stroke of 75 mm. and 78 mm. respectively, giving 688 c.c. capacity) in our issue for December 12th, 1918.

We understand that several prospective manufacturers of light runabouts are interested, and that deliveries of this engine have now commenced. In a very short time the output facilities will be sufficient for 100 engines per week.

The Coventry Victor flat twin in a demonstration frame. Note the unusual position of gear box

THREE USEFUL CLEANING BRUSHES.

WE have received three samples of cleaning brushes from Mr. T. Coltman, 2, Providence Place, Laisterdyke, Bradford, which should be very useful in cleaning the various parts of motor bicycles. The engine

A useful set of cleaning brushes.

cleaning brushes are of distinctly good design, because the wires securing the bristles do not bulge out, as is often the case, and therefore allow the brush to reach inaccessible parts. The spoke brush shown is of a size rather too large for motor bicycles, but a smaller size is manufactured, and will be ready for delivery by the time these notes appear.

TORPEDO SIDECAR BUILT OF STEEL.

STEEL for the building of sidecar bodies does not, on casual consideration, appear to be a material particularly suitable for the construction of light sidecars, but quite a number of firms are now using it with considerable success. The difference in weight, however, between a body built of three-ply wood and thin sheet metal is not so great as one would imagine, and if any disadvantage does exist on the score of weight when steel is used it is counterbalanced by gain in durability and strength.

Newcomers to the manufacture of sidecars, who evidently believe in material more durable than wood, are Messrs. the O. N. Davis Engineering Co., Ltd., Queensland Road, Holloway, London, N.7, who are introducing the Odec sidecar, which has a torpedo-shaped steel body built on "sporting" lines. The backrest is constructed to allow for removal,

The Odec sidecar, having a sporting body built of thin sheet steel.

giving access to a receptacle at the back suitable for the storage of petrol tins and luggage, whilst the seat itself is adjustable.

The chassis construction is to be of a very light character, and the complete sidecar will be quite suitable for attaching to lightweight machines. Suspension in front is by spiral springs, and at the rear by C springs, the upper ends of which are attached to the body through a double shackle.

Although designed as a sporting sidecar, this model is not particularly low in build, and permits of easy conversation between passenger and driver. The makers intend to manufacture several types of sidecar, and are making arrangements to place large quantities on the market within a short time.

READERS' ROAD REPORTS

THE following are culled from this week's mail bag of readers' road reports:

Chester to Llandudno, *via* Connah's Quay, Queensferry, Abergyle, and Colwyn Bay.—Very bad to Abergyle, but much better after.

The Great North Road (south of Doncaster to London).—With the exception of a mile near Rossington Bridge (three miles from Doncaster), good. From Doncaster to Ollerton and Nottingham, very good condition generally.

The best way to reach North Wales is *via* Wrexham, Mold, and St. Asaph, which was in excellent condition a few weeks ago. The road *via* Welshpool and Dinas Mawddwy is by far the best way of reaching Dolgelly and Barmouth.

Liverpool to St. Helens, *via* Prescott.—Very bad all the way.

Sidcup (Kent) to Hazlemere (Bucks), *via* London.—Sidcup to New Eltham fair, had in patches. New Eltham to Eltham bad. Through Eltham to Lee good. Lee to Lewisham fair. New Cross through Old Kent Road to Westminster Bridge very bad. Over Westminster Bridge fair. Victoria Street bad in patches. Victoria to Gunnersbury Lane, Chiswick, good. Through Gunnersbury Lane to Uxbridge Road, Ealing Common, fair. Ealing Common to Hanwell fair. Hanwell to Southall very bad. Through Southall wood paving good. Southall to Uxbridge bad. Through Uxbridge wood paving good. Uxbridge to Gerrard's Cross very bad. Gerrard's Cross to Beaconsfield had, except one or two short stretches before getting to Beacons-

field. Through Beaconsfield good. Beaconsfield to Penn very fair. Penn to Hazlemere good.

Between Tring Station and Tring Town the first half-mile is good but the next mile is very bad indeed, so that a motor cyclist is apt to drive too quickly over the first portion of the journey and strike the second portion too fast.

Between Edgware and Stanmore, after leaving the tramlines, the road is bad the whole way to the latter village.

IMPROVING THE MAKER'S DESIGN.

USUALLY when a motor cyclist fits such a thing as a vaporiser to his machine, the general appearance of the machine is not enhanced, and sometimes such devices are clumsily and roughly made. But the owner of the Harley-Davidson illustrated here—Mr. Bateman,

A vaporiser which improved the running of a Harley-Davidson on heavy fuels.

of Coventry—is a mechanic, and the hot air muff shown is well made and highly finished. In fact the whole of the machine is an example of how a machine should be kept.

The vaporiser takes hot air from both exhaust pipes, to which it is connected by two copper pipes, the whole being plated and polished.

Watch cases of the design shown above are used by the Cork and District Motor Cycle Club on their reliability trials. Pliers with a changeable design are used for closing the seal.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Herford Street, Coventry, and must be accompanied by the writer's name and address.

SCOTTISH FERRIES.

Sir,—Can you or perhaps one of your Scottish readers inform me if there is any trouble about getting a motor bicycle across the Forth from Granton to Burntisland? It looks so beautifully simple on the map that I feel sure there is a catch in it somewhere. Are motor bicycles carried on the ferry, and, if so, are there any humbugging regulations about carrying petrol, or anything of that sort?

Also, are the Highlands of Scotland now open for tourist traffic?
Sheffield. W 5124.

DIFFICULT STARTING.

Sir,—There have been so many complaints lately in *The Motor Cycle* about difficult starting that a hint which I saw given in an old number of *The Motor Cycle* might be worth repeating. It is to *heat the petrol*.

I had great trouble with my own machine lately in this respect, and so now I just put my petrol squirt (which is full of petrol, of course) into an old jar full of hot water, and inject some of this hot petrol into the cylinder; or, if this does not do at once, into the plug, and this sets the "jigger" off first push.
Tynemouth.

EXPERIENCE.

LOSING ONE'S PROP.

Sir,—It is kind of "Torque" to suggest to me the Socratic method of arriving at the truth. It reminds me of his magnanimous offer *re* handsome wreath. But as an evasion it is not so skilful, for Socrates never wandered from the point, possibly because, unlike "Torque," he never found himself in chancery.

Why does not "Torque" say that he gives up as a bad job further attempts to evade a direct answer to my question, instead of saying that he gives me up as a bad job?

His letter of May 1st marks the second time that he has parried my demand for chapter and verse with a counter question, and, for the second time, I will answer him.

Where "Torque," to use an R.A.F. colloquialism, "slips up" is with reference to question No. 1 of the Socratic dialogue, Does a lost prop remain *stationary* during a dive at 100 m.p.h., A.S.? Granting, under protest, that 100 m.p.h. air speed is a dive, the answer is in the affirmative, with the reservation that under abnormal conditions the prop might make a partial revolution, which would, however, be insufficient to start the engine.

Answering question No. 2, If so, why? the compression in a normal stationary aero engine is such as to prevent mere "friction of the air on the propeller" ("Torque's" phrase) from turning the engine over compression with the jerk necessary to secure an explosion.
REVS.

Sir,—As a reader of *The Motor Cycle* I have noticed from time to time certain correspondence therein dealing with aeronautics by "Revs," "Torque," "Spark Plug," etc., who appear to have some knowledge of the subject. At the same time I do not see the connection between this subject and motor cycling. However, I should like to point out that "Spark Plug" is wrong in stating that he does not think a Siddeley Puma engine could be started by diving the machine. If this had been true my machine and I might have found a landing ground on the top of Manchester Cathedral. For, whilst on a certain occasion I was testing a new machine fitted with a Siddeley Puma engine, I was so unfortunate as to lose my propeller at a height of 2,600ft. over the centre of Manchester, and regained it after a

dive down to 900ft. (heights approximate). I may say at the time I forgot I had wings or tail plane to drop off, but I could not have cleared the city otherwise. The engine had the usual two-bladed propeller. This, I think, proves that a Siddeley Puma 230 b.h.p. can be started by diving the machine.
CONTACT.

Accrington.

[This correspondence must now close.—ED.]

THE NEW A.B.C.

Sir,—I have been much interested in the letters, etc., *re* the new 3 h.p. A.B.C., and was hoping to see some sort of answer to "A.D. 3744's" letter, which appeared in *The Motor Cycle* of April 24th, but I was disappointed to find no reference to it in *The Motor Cycle* for May 1st.

I think he gives a wrong impression in his sketch, which gives the idea that the spring is of the form of a beam fixed at one end and pin-jointed at the other (front) end, whereas it is a beam fixed at both ends and with the point of contraflexure approximately at the centre. I may be wrong, but the rear springing appears to me to be designed (not cribbed) perfectly, *i.e.*, in a proper scientific way, and for this reason I do not see how anything much can "happen" after "n" hundred miles. Some motor cycles I have seen give the impression that if one were to ask the designer (so-called) what relation shear has to bending moment he would just gape and wonder what one was talking about. The A.B.C. does not give me that impression, and I should like to add that I have nothing whatever to do with the firm except as a "longing to be customer."
Colchester.

DON PIP.

FOUR-CYLINDER MOTOR CYCLES.

Sir,—I have noticed that several of your correspondents ask when we shall get a good British four-cylinder machine. I take it that the Ogston Co. will continue the manufacture of the T.M.C. very shortly. I have driven one of these machines hard for nearly three years, and have nothing but praise for it. The only mechanical troubles I have had are, first, the brass gear wheels of the water pump wearing out, and secondly, the breakage of a rear spring on the sidecar side of the machine. The machine is a pleasure to handle, the workmanship excellent, the material of the best, and, with a No. 22 Zenith carburetter, I get 60 m.p.g. and a true tick over in neutral. I have driven exactly 20,000 miles, and have just ground in my valves for the second time, and the condition of the exhaust valves was very good, not a trace of pitting. I have covered in my valves, and the machine is now practically noiseless except for the purr of the exhaust. The starting, even on present-day petrol, comes at the second turn over, without injection, even in the coldest weather. I do not know of any machine other than the T.M.C. that can pull a sidecar and passenger at as low a speed as 8 m.p.h. on a $3\frac{1}{2}$ to 1 top speed. The first speed is only $7\frac{1}{2}$ to 1, and my combination is a heavy one, but I can take any hill I have come across in Kent on second speed— $5\frac{1}{2}$ to 1. The back wheel can be retired without taking it out in less than five minutes—as quickly, in fact, as any machine with detachable back wheel—or the back wheel can be taken out and replaced in ten minutes easily.

I have no interest in the Ogston Co. commercially, but I am anxiously awaiting their next model. The only improvements I can suggest to them are (a) gear drive for the oil and water circulating pumps; (b) Zenith carburetter with accelerator pedal as standard—the pulling power with this instrument at low speeds on top gear is phenomenal.

E. W. KIDDELL.

STURMEY-ARCHER

The SturmeY Archer went over the water with the first of the "Old Contemptibles." It "stuck it" on every front through the whole four and a half years of war. Now it has been demobilised and has resumed civilian service. It is at your service now, and if you want to know the service the SturmeY Archer gives ask any soldier. We will leave it at that.

The STURMEY ARCHER COUNTERSHAFT GEAR will be the mark of all good post-war motor cycles; see that you have it fitted to yours. It makes just all the difference between pleasant motor cycling and—the other thing.

FIELD TELEPHONES FOR MOTOR CYCLE HILL-CLIMBS.

Sir,—It has occurred to me that the authorities must have a large quantity of field telephones, cable, etc., which is of no further use to them, but which would be a great boon to motor cycle clubs to enable them to rig up electrical timing apparatus for use at hill-climbs, speed tests, etc.

We have a large number of members already demobilised, who would be quite competent to lay and work such apparatus, and doubtless most other clubs are in a similar position.

I need hardly add that the very fine part taken by motor cyclists in the war entitles them to special consideration in this matter. Perhaps you would be able to do something for us and other clubs who are anxious to run their events under the best possible conditions.

RONALD S. RUSSELL,

Hon. Secretary Cork and District M.C.C.

PRESSED STEEL FRAMES.

Sir,—I have taken your paper for the last six years, and have noticed very few suggestions for pressed steel frames. I enclose a rough sketch of what I think is an ideal pressed

Suggested pressed steel frame by Pte. R. M. Smith.

steel frame. The only drawback is that the rider's feet are inside the body, but this might be overcome by fitting a stand worked by a lever, so as to keep the machine upright when it stops. The saddle is shown by a dotted line. T.T. bars should be fitted, so as to obtain a better balance.

B.E.F.

R. M. SMITH (Pte.).

SPARE PARTS.

Sir,—As an ardent reader of *The Motor Cycle*, I feel I should like to express my entire agreement with your article in the issue of April 10th concerning spare parts.

I ordered new piston rings and gudgeon pins on March 21st. On March 30th I wrote to the makers of my engine, asking them to send me an invoice as soon as possible, so as not unduly to delay the despatch of parts. They wrote acknowledging my order of March 8th (*sic*). I then telephoned through to them at the expense of three calls, and after being shunted from department to department (and to each of which I had to go through the whole story), I finally reached some part of the factory where my order was recollected. They could not understand the delay, and promised immediate despatch on receiving remittance, the amount of which I then learnt for the first time. I told them the cheque was being posted, and to send the goods when received. I also told them not to hold up the goods if they found that their estimate was 1½d. more than they told me. They said they would not. Three days later they acknowledged my cheque, but required a further amount owing to their miscalculation of costs, and said they would then send the parts *as soon as possible*, i.e., probably three or four more weeks at the earliest. Cannot I do anything?

It amazes me that a firm of their size should keep their correspondence in such a hopeless muddle, and be generally about as disobliging as it is possible to be. I feel I would much rather satisfy my feelings on this firm than get the parts now.

P. DE R. MASON.

Sir,—Not the least pleasing feature of your excellent journal of April 10th is your reference to spare parts.

My experience will perhaps, in the light of that article, be of interest. I have a 1913 4½ h.p. combination, and last November my agents, Messrs. Wauchope, of Shoe Lane, Fleet Street, sent to the makers on my behalf, asking to be provided with second-speed gear wheels for main and layshaft.

No notice was taken of the order for some weeks, when it was repeated, and receipt acknowledged.

Another application later elicited the fact that the parts required were in the hardening shop, and would be sent along soon. Still nothing happened. Then I wrote myself, quoting their reference, asking them to speed up delivery.

I had a reply stating that the order referred to could not be traced: "please let us know what you want and we will send it along." I then went to Messrs. Wauchope and complained that they had not apparently ordered the parts required, and I was shown a whole pile of correspondence relating to the matter.

I again wrote, quoting some of their letters to Messrs. Wauchope, and received a postcard in reply, regretting inability to supply my requirements quickly owing to shortage of material and labour troubles. (All this after the parts had been in the hardening shop for about ten weeks.) Again I wrote, asking them to explain the discrepancy between the letters I had and those sent to my agents, but up to the present have not been favoured with a reply, neither have I received the parts, and my outfit is still lying idle. Nearly five months have elapsed since the order was placed, and I do not as yet know whether they are going to supply me or not. If they would tell me that they cannot worry over spares, then I should know what to do.

W. A. HILL.

A HOME-MADE CLUTCH.

Sir,—In a recent issue of *The Motor Cycle* I see that Mr. R. L. Boyd asks for details of a home-made clutch on a countershaft mounted in the pedal bracket. As I have made such a device, I send a sketch, which I hope will be of some interest to your readers.

The axle is a piece of mild steel with 3% carbon; it is bored through with an 8 mm. hole (I think 7 mm. is large enough). The ball bearing cone is a piece of tool steel, hardened and ground, and screwed up tightly against the shoulder.

Mr. Vagn Prytz's
countershaft
clutch.

The belt pulley is made of two discs of mild steel, 8in. diameter, turned all over, so that the angle is exactly 23°.

The chain wheel is from

an old bicycle. It has nineteen teeth for chain, 1in. pitch and ½in. wide. (It ought to be ½in. or ¾in. pitch, but I could not get such a wheel.) The chain wheel on the engine has ten teeth.

I cut all the ribs out of the large chain wheel, and brazed on a disc; to this is fastened two pieces of Raybestos or Ferodo lining. The disc runs on a roller bearing, as shown. The pulley and distance piece are secured to the axle by a key screw, while the outer piece of the clutch slides on the axle with two keys, which are soldered on to the axle.

The spring is an old saddle spring. The clutch is not fitted with a kick starter, as my engine is only 2½ h.p.

I have not yet tried the clutch with the engine running, but I hope to do so shortly.

VAGN PRYTZ.

Hellesup, Denmark.

OBTURATOR RINGS.

Sir,—The statement by Engineering and Arc Lamps, Ltd., re the considerable development of obturators during the war is, to my mind, very misleading. From my experience the development, if it may be so called, has been no more than "very moderate"; in fact, since about the middle of 1916, I have noticed a considerable deterioration in the efficiency of the few thousand obturators which have passed through my hands during the war. Far from the obturator giving no trouble, it is the constant source of the necessity for the overhaul of such engines as the Clerget, Monosoupape, and Gnome.

With regard to the citation of an actual flying life of 250 hours, well—the least I can say is, that 120 hours, such as I have known odd sets to run, is beyond the wildest dreams of imagination of the overworked R.A.F. mechanic, or the average pilot. My own statement as above (120 hours) has been discredited by pilots of considerable ex-

perience and position, even when backed up by log book entries. The most common trouble with the obturator is breakage at the "lip," and burning of the ends, either of which invariably causes about £30 worth of damage to the average rotary engine. Finally, I would add that the efficiency or otherwise of the obturator resolves itself in the main to a metallurgic problem. The perfection of this type of ring will be yet another triumph of those practised in the art of metallurgy.

EX-TECH. SERGT.-MAJOR, R.F.C. and R.A.F.

A SIMPLE CYCLE CAR.

Sir,—“Chinook's” article published in *The Motor Cycle* recently on the cycle car is very true. There is a big

A suggested cycle car on the lines of the Chater-Lea machine produced several years ago.

future for it if only the right sort could be produced. I have been riding a flat twin 500 c.c. Brough for the last 4½ years and have got the idea that the flat twin would be an ideal engine for a small light cycle car.

I am sending you a rough sketch not exactly to scale, but approximately proportionate. It seems to me that an extremely simple runabout could be made with the engine unit together with the gear box, that would be easily detachable and very accessible, and do away with the motor cycle frame. All it would require would be a simple chassis about 5ft. long by 2ft. wide, with three cross stays to take the engine and gear box, with quarter-elliptic springs back and front to axles.

The Sturmey-Archer countershaft gear is very suitable with its hand controlled clutch and easily operated gears.

Bakewell.

W.A.M.

STARTING TIPS.

Sir,—I have noticed sundry references to difficult starting on war spirit recently. As one who has been privileged (!) to ride all through the restrictions, perhaps you will allow me to make a few suggestions. First, with everything cold, it is impossible to get A1 starting with C3 spirit. I do not think much of the hoary tip of pouring a kettleful of boiling water over the carburettor stub; it is messy, and, with inlet pipes swathed with insulating tape, etc., against air leaks, impracticable. But many people do not mind a little trouble if they can ensure an easy start after it. So I suggest taking out the plug—in the case of a twin one is enough—and doping liberally through the plug hole. Then put the plug on a gas ring, or the bars of a fire grate, for a few minutes, or till it is too hot to handle with bare fingers; then replace and start immediately. I have found this method infallible. It sounds wasteful of time, but the plug can be heating while one is putting on overalls, etc. A simpler method which is effective on less cold days is to put the petrol squirt into a cup of hot water before doping. This is one of the simplest tips, but surprisingly few people seem to know it. In the case of stops up to an hour in length the machine, if possible, should be put up out of a draught, as it will retain sufficient warmth to get an easy start, but if in the slightest draught it will get stone cold in a very short time. Reverting to the plug heating, a porcelain insulated plug will not stand up to it. I have ruined several, but an old single-point steatite Sphinx has stood up to the treatment for two years, and is still sparking as well as ever, nor have I yet succeeded in destroying a Lodge Aero in this way. Usual disclaimer.

(REV.) J. M. PHILPOTT.

MOTOR CYCLE IMPROVEMENTS.

Sir,—Having had experience of belts that slip badly in wet weather and pull through, usually going up hills, also of chains that collect filth, stretch and snap, might I suggest that makers of motor cycles should turn their attention to a better system of transmission from the engine to the road wheels, particularly in the case of sidecar combinations.

The ideal system to my mind is a shaft drive (bevel gear, not worm). Many years ago cars were fitted with chain drive, and the fact that this system has been almost completely scrapped should set motor cycle makers thinking.

A previous correspondent has written on the subject of noisy exhaust and infernal clatter from valve tappets, making conversation with the sidecar passenger almost impossible.

Unfortunately I am not in a financial position to set about making what I consider to be the ideal sidecar machine, but I feel sure that the manufacturer who built a motor cycle with bevel shaft drive and a miniature “silent Knight” engine would find an immense market for his production from people who want a “no trouble” sidecar combination.

Finally, I cannot understand why firms still persist in putting the flywheel inside the crank case in view of the loss of power caused by the wheel having to churn round in a viscous sea of thick lubricant. The well-known Douglas and the new Blackburne model mark steps in the right direction, though at the same time I consider that all outside flywheels should be enclosed in a case to prevent oil slinging should the lubricant leak through on to the flywheel, and to prevent accident in the event of the flywheel bursting at excessively high speed.

Isleworth.

E.G.H.

THE RULE OF THE ROAD.

Sir,—If you can spare the space, I should like to give a word of warning to riders, both of motors and cycles; in fact, to all users of the road to exercise the greatest care during the period the Overseas service men are coming back into civil life. They have been used to the Continental rule of the road in a great many cases, and accidents are liable to be caused by their forgetting our customs when they first come home. This is not theoretical, as I had a collision, while riding a motor cycle, with a pedal cyclist just recently. The road was otherwise deserted and quite clear, and each in full view of the other, and although the cyclist was nearer his wrong side than the centre of the road he never thought of stopping, and when quite close he cut in to his right. I jammed down the brake, but was too late to avoid him. Fortunately, damage was very little in either case, and he explained his conduct by saying he was only a few days home from France, where they kept to the right. I hope this may serve its purpose, as a warning to others who might have a similar experience, as accidents are never pleasant, to say the least.

W. H. JAMESON.

SPRINGING THE MACHINE.

A Few "Armchair" Notes on an Engrossing Subject.

A FOREWORD may be said on the subject of springing generally. Although it is not possible to have too comfortable a machine, there are limits to the extra expense and weight of springing beyond which it would not seem worth while to go. To judge from the numerous letters one reads, it would be gathered that it is an everyday performance for each motor cyclist to climb, say, the Himalayas, or to ride up an ancient river bed, or over railway sleepers two or three inches above the permanent way. Granted there are motor cyclists who do these things, some from choice and some from necessity. If they are in sufficient numbers to warrant it, by all means let them have a machine suitable for the work. But let it be a distinct model, so that we may retain our own mediumweight English machine. We do not need river bed models. Further, it ought to be our endeavour to make every road suitable for any machine to ride on rather than to make every machine suitable for riding on any road—or apology for a road.

Perfect Roads or Perfect Springing?

The absolute "go-anywhere" machine tends to become an obsession. A lesson might be learnt from experience in France, where for riding over canal beds, ditches, dykes and trenches, tanks were used and not motor cycles. Perhaps, now that the super-organisers are seriously at work there may be something done in the way of segregation of road traffic. It is not a very brain-fatiguing matter to imagine some of the saving this would effect both to the road authorities and to the owners of vehicles. Every bad road means the expenditure of pounds in weight and in cash more than should be necessary for motor users.

Perfect roads and perfect springing are inevitably correlated. Both are ideals which will never be fully realised. As the cynic may say, "The advent of the perfectly sprung machine will only occur in the era of perfect roads, and that will be when there is no man left to ride on them."

The following notes are intended principally for the general reader who is fond of pursuing, in the

armchair as well as on the road, problems relating to the motor cycle.

The study of springing systems is of the most absorbing interest, whether taken analytically or synthetically, whether you amuse yourself by pulling to pieces systems already designed, or occupy yourself in building one up according to your own theories.

Interest never palls, and the game is never finished. You or somebody else will find objections to any system of springing you can devise. In time the subject begins to have an attraction something like that which the question of

perpetual motion or of squaring the circle had for the philosophers of old. A proof of this may be found in the scores of patents which have been taken out for spring forks during the past dozen years, and for rear springing systems in more recent times.

Explanation of Diagrams.

Fig. 1 shows a wheel meeting an object on the ground. The line A represents the force set up on impact. This force can be resolved into the two forces B and C. In other words, if the two forces B and C acted as shown in fig. 2, they would have exactly the same result as the single force A. Further, if we balance, or, in the case of springing, "cushion," each of the two forces B and C, we have in effect "cushioned" force A. We may say, then, that any force acting on the wheel to cause a shock may be replaced by imaginary forces acting (1) parallel to the ground, or (2) at right angles to the ground. If arrangements of coils, air springs, or leaf springs are provided to allow these forces to be gradually, instead of suddenly, dissipated, then the wheel is satisfactorily sprung. If both wheels of a machine

are satisfactorily sprung, then the whole machine is satisfactorily sprung. Figs. 3 and 4 show theoretically correct designs for springing a single wheel.

Some of the reasons why practical designs cannot readily be arranged to give theoretically perfect springing are:

(1.) The need of lateral strength, so that there may be no side-play.

Springing the Machine.—

(2.) The fact that brakes are fixed on wheels and a wheel must be rigid, or practically rigid, in the direction in which the brake acts.

(3.) The back wheel takes the drive; here again the wheel must be practically rigid in a line joining the wheel centre and the engine (or countershaft) centre.

Fig. 5.

Because of having to take these things into consideration, most types of spring forks are rigid in one

direction, generally in the direction of the horizontal force B. Others are made to cushion first one force and then the other (not the two simultaneously), with the result that there is a movement of the fork first backwards and then forwards, reversals of movements continually taking place as the springing arrangements are performing their functions.

No types of front forks are shown. Examples of these can be found in any issue of *The Motor Cycle* and analysed by the reader for himself.

Rear Springing.

In rear springing, attention may be drawn to the fact that a machine may be quite suitably sprung for solo work and yet not for sidecar work. Also, a springing system which might be all that was desired for a lightweight might not fill the bill for a heavy-weight. Consequently, for rear springing work it would seem probable that a number of systems will be necessary, or sacrifices have to be made in certain directions.

Most methods of rear springing are variations of the methods indicated in fig. 5, the two examples shown lending themselves to illustration of what may be called the hinged back wheel method. The objects

aimed at in the different variations are to make the frame as strong laterally and as free from whippiness as possible; also to arrange the hinge so that there is as little alteration in chain or belt tension as possible when the springing device is in operation. Considering the last-mentioned point, it is obvious that the best form of rear springing would be realisable in a machine having a flexible shaft drive.

A Concrete Example.

The importance of strength in the different parts of a springing system may be shown by a few simple figures.

Suppose the weight of a machine and rider to be 360 lb. and that two-thirds of this weight is taken by the back wheel and one-third by the front. When the machine is travelling at the *slowest* speed it is possible to pass over an object such as is shown in the diagrams, the resultant upward force C will be:

For front wheel slightly greater than 120 lb.

For back wheel slightly greater than 240 lb.

That the force C will be much greater for higher speeds is evident, and the danger of incurring a fracture is augmented by the application of the force being almost instantaneous instead of what may be termed gradual, as at slow speeds. Consequently, it will be realised that special care must be exercised in providing the necessary strength of springs, links, etc., and in designing a springing system for machines that are expected to maintain a *high speed over rough roads*. In example fig. 6 the engine is not sprung, but the arrangement gives very good insulation from road shock for the rider, and is very suitable for solo and lightweight work.

Fig. 6

ENGRO.

A MEET OF WEST OF ENGLAND MOTOR CYCLISTS.

Yelverton Rocks, a rendezvous familiar to Plymouth motor cyclists. It is situated on the high wild ground of Dartmoor. Among the machines shown are B.S.A.'s and an Enfield outfit.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Knocking.

When going up hill I set my levers about two-thirds open, which seems to be the best position, although when going up a fairly steep hill the engine knocks, and, if I open or close the air lever, or open the gas lever, it knocks more, but if I close the gas lever it stops knocking, but slows up and stops. Would you please tell me the cause of my trouble?—O.J.O.

In hill-climbing, as soon as the engine shows signs of slowing down, gradually close the air lever. Have you tried benzol? The trouble is probably due to the machine being geared too highly. We presume the engine is free from carbon deposit?

Water Injection.

(1.) What is the address of the manufacturers of the Philipson pulleys, and are they now making them? (2.) If I fit one to my 1912 F.E. Triumph, will it enable me to take a featherweight sidecar? (3.) What maximum and minimum gear ratios shall I get, and is there appreciable belt slip on the lowest gear? (4.) In starting up on free engine, does the gear automatically lower itself until the machine is under way? (5.) My machine knocks very badly when it gets the least warm. The valve timing and ignition are correct. Do you think the compression is too high? I know that benzole will cure the trouble; but other machines of the same make and date run satisfactorily on No. 3 petrol, and I do not see why mine fails. Can you suggest anything? (6.) If I run on benzole, would it be an advantage to have a hot air inlet? (7.) Have you had any experience in running on paraffin with steam injection in the induction pipe; if so, is there any pre-ignition on full load?—P.A.H.

(1.) Messrs. Philipson and Co., Astley Bridge, Bolton, Lancs., and they are still marketing their pulleys. (2.) Yes. (3.) Depends on the size of the rim. The pulley sizes are 5½ in. top, 1½ in. bottom, which will give you your ratios. The belt slips when it rests on the bottom of the groove. (4.) No; the tendency is for the gear to climb to top. (5.) Your machine probably requires decarbonising. (6.) You require a good deal extra air with benzole, but it is not necessary to heat it. (7.) There is no pre-ignition with water injection, but it cannot be regarded as satisfactory excepting on high powered machines.

Address Wanted.

I have a Vindec Special. Would you oblige by giving me the maker's address, as I am in need of spare parts.—A.N.
The Vindec was marketed by Messrs. Brown Bros., Ltd., 22-34, Great Eastern Street, London, E.C.

Clearances.

(1.) Will you tell me the correct clearance between an air-cooled cast iron cylinder and (a) a cast iron piston, (b) steel piston, and (c) aluminium piston? (2.) A water-cooled cast iron cylinder and (a) a cast iron piston, (b) steel piston, and (c) aluminium piston? (3.) Also please give me the correct or approximate valve setting for a racing motor cycle engine.—J.C.D.

(1.) It depends on the bore of the cylinder. The same amount of clearance on a cylinder of 70 mm. bore would not do for one of 85 mm. bore. The average clearance with a cast iron cylinder and a cast iron piston is 4-1.000th inch. The clearance for a steel piston would be more than for a cast iron piston, and for an aluminium piston slightly more than for a steel piston. The correct amount of clearance is a question of experiment, and varies in the case of the different manufacturers. There is no fixed dimension. (2.) The clearance for a water-cooled cylinder and cast iron piston is approximately the same as for an air-cooled one. The cooling of the cylinder prevents distortion of the cylinder, but it does not prevent distortion of the piston which is subjected to the same amount of heat in a water-cooled engine, as in an air-cooled one, and, of course, the increased clearance in the case

of steel and aluminium pistons would be the same. (3.) There is no standard valve setting for a racing motor cycle engine; the setting varies with different designs, and there is no fixed rule. Below we give you a setting of a well-known 3½ h.p. single-cylinder engine: Inlet valve commences to open at 8° to 13°, and commences to close at 137° to 143°, and is completely closed at 207° to 213°. Exhaust valve commences to open at 135° to 140°, and is fully open at 220° to 226°. The exhaust valve commences to close at 272° to 276°, and is closed at 0° to 5°.

Too Much Noise.

I have a 3½ Norton which is fitted with an exhaust pipe, 1½ in. diameter, direct from the cylinder without any expansion box. The noise is especially noticeable when accelerating, or when travelling at high speeds. Am I rendering myself liable to prosecution, and if so, how can this be remedied?—W.J.A.

The only remedy will be to fit an expansion box, otherwise you render yourself liable to prosecution.

Lubrication of a Twin.

As my 4.5 h.p. J.A.P. twin seemed to be losing power, I took it down for overhauling, and found that both the rings on No. 1 cylinder piston were broken at the ends. The cylinder seemed rather on the dry side. (1.) Would under oiling cause the damage and be the most likely cause? (2.) Would it affect the running much? (3.) I am using extra heavy Mobiloil with Oildag. Would you consider this too heavy? (4.) Can I do anything to equalise the oiling of the cylinders, as the front cylinder is getting the right amount, and an increase would mean frequent decarbonisation? In this case the rear cylinder was much cleaner than the front? (5.) I suppose the baffle plate under No. 1 is a fixture, otherwise this might be drilled? (6.) Would a slack valve guide on the inlet valve cause an air leak and difficult starting, and would Duco valve lubricators help to ease it?—G.B.A.

(1 and 2.) Under-oiling would cause the damage of which you complain, and would naturally affect the running as it would allow the charge to escape past the rings. (3.) Perhaps the oil is rather heavy in cold weather. (4 and 5.) You might try the effect of drilling the baffle plate. (6.) We think valve lubricators would be beneficial in this case.

SPECIAL NOTICE.

TO EVERY READER.

TO ensure regular supply of "The Motor Cycle," readers are requested to place definite orders with their newsagents or at a railway bookstall for copies to be reserved or delivered each week. To depend upon chance purchase is to risk disappointment.

Old Spring Forks.

? I have bought an old machine, fitted with the old pattern XI-All spring forks. There seems to be a great deal of side play, so that the tyre rubs against the fork. Would you be so good as to tell me: (1.) Is this avoidable? And if so, how? (2.) Would some variety of pad taking the wear on the rim instead of the tyre be feasible? (3.) Is the present state of affairs dangerous? (4.) Would the stresses set up by a sidecar affect it in any way? (5.) Apart from the question of comfort, is this fork superior to a rigid one?—G.P.H.

(1.) Possibly washers of the spring type would take up the play. (2.) No we should not recommend it. (3.) Yes, for the tyre. Constant friction will rub through the cover and cause the air tube to protrude and burst. (4.) Yes. (5.) Any spring fork when working as it should is superior to a rigid one.

A Double Accident.

? I should be glad if you would put me right on the following point: Whilst driving my 4 h.p. Brabury and sidecar in Wales along with a friend on an 8 h.p. sidecar I met with the following accident. The other machine was a few yards in front, when the countershaft chain on the 8 h.p. machine snapped, locking itself around the sprocket wheels and locking the back wheel, which brought it to a halt within about three yards, incidentally smashing the low gear in the gear box. The stop was too sudden for me to clear the machine, and my front wheel caught the luggage grid, throwing my machine over on its side, smashing the front fork, wheel, mudguard, lamp, top and bottom tubes of the frame near the head, and twisting the sidecar axle partly out of the chassis. The only damage caused to my friend's machine was the buckling of his sidecar wheel, but this we were able to straighten up so that it would run. The 8 h.p. machine is insured for third party fire and theft; my machine is not insured. Have I any clear ground for a claim against him? The damage, roughly, may be about £20 to £25, as it might mean a new frame. I may say I have been riding motor cycles of nearly every make since 1910, and am looked upon as a safe and skilful driver. A witness to the accident was another member of the party in a car, who was behind and saw the smash.—F.B.J.

We should advise you to consult, through your friend, the insurance company, as to whether they will meet the claim he makes on your behalf. Personally, we do not think you have got a legal claim against your friend, as if the case were tried in the county court the judge would most probably decide that the snapping of the countershaft chain on the 8 h.p. machine and the locking of the back wheel were failures over which your friend had no control, and therefore it was an accident. We should recommend the claim to be made by your friend, who is insured, in such a manner that the amount claimed will cover your expenses.

An Old-type Twin.

? I have a motor cycle built by a local maker fitted with a V twin engine, 5½ h.p.; the ignition is by coil and accumulator. What will be the cost of a magneto, saddle, inner tube, and brake?—A.F.

Your best course is to apply to the local maker for a quotation for the parts you require. If he cannot estimate, then write to a firm like E.L.C. Co., Samson Road North, Birmingham; or Thomson Bennett, Magnetos Limited, Great King Street, Birmingham, for the magneto. The saddle, inner tube, and brake should easily be obtained in a city like Belfast.

Hub Gears.

? My machine is a New Hudson 1914 6 h.p. twin combination, fitted with Armstrong hub gear. This latter is far from satisfactory, and I should like to know if I could substitute, say, an Enfield two-speed countershaft. If so, would it be very costly?—D.K.

Doubtless you can substitute a countershaft gear for the hub gear mentioned. As to cost, enquire of the makers of the machine, Messrs. the Enfield Cycle Company, Ltd., Redditch, Worcestershire, and allow for the cost of fitting. It might entail some structural alteration to the chain stays, i.e., the tubes from the bottom bracket to the rear fork. You could get your hub gear put in order if you were to communicate with Messrs. the Cromwell Engineering Company, 327, Putney Bridge Road, London, S.W.15.

READERS' REPLIES.

Four-stroking.

"L.P." will find a No. 28 jet most suitable for his engine. There are no choke tubes in this type of carburetter (Senspray), but a remedy for the four-stroking will be found if he runs the engine as follows: Start up with air closed and spark advanced two-thirds (approximately), petrol lever about half-open. After running about twenty yards retard spark and petrol lever, and begin to open air lever slowly until engine is two-stroking perfectly. Should engine fail to two-stroke, depress air release valve several times, and release quickly each time. The remedy lies in the correct air mixture.—F. WILSON.

Difficult Starting.

With reference to the complaint of "H.S.," page 401, in the issue of April 17th, I have experienced a similar heart-breaking difficulty with my 1913 5-6 h.p. Rudge Multi. Perhaps "H.S." will try the following proved solution: Turn the engine until the inlet valve is open, and inject down the valve stem a few (very few) drops of petrol. This method of injection has at least saved me much hard labour. Injections through the compression top do not have effect if there is the slightest sign of carbon deposit, as the deposit blocks the passage.—STAN. W. SMITH.

I notice in *The Motor Cycle* of April 10th a letter from "A.G." in reference to the difficulty he experiences in starting his 1913 Rex. As I am in possession of a similar machine, I may be able to help

him in his hour of need and probable despondency. I may say that my first experiences with this machine began in the winter, and it was my doubtful pleasure to have to start the old 'bus from cold on the glorified (?) mixture untruthfully designated as petrol. I have learnt by now quite a number of dodges for starting my machine, and these may be of use to "A.G." I have a Binks carburetter on the machine, and have so far been unable to find any dead spot; for one thing I do not know what a dead spot is. Is it any relation to the things they put in petrol to increase the m.p.g.? With this carburetter I can get a mileage with sidecar and two passengers of 140 m.p.g., and can usually touch anything on the road that will allow itself to be touched. If you do not believe this statement it matters not, as I do not believe it myself, but I thought I would like to give you a shock. However, to get down to brass tacks, this old 'bus of mine, although approaching its sixth year on earth, is a wonder. Undoubtedly at first one experiences difficulty in starting, but I am quite sure when once "A.G." gets over the difficulty of starting (for further particulars, write the subscriber), he will find he has a jolly good old reliable in a 6 h.p. 1913 Rex, that is if it is in anything like the condition of mine.—C. N. WESTOBY.

[We are case-hardened to shocks of this kind. A letter addressed to our correspondent c/o the Editor will be forwarded.—Ed.]

EXPERIENCE WANTED.

"C.H." (London).—Auto-wheel attached to Olympia tricycle and assist pedalling on short journeys in a flat district, to carry two persons.

RECOMMENDED ROUTES.

BRADFORD TO ALDBOROUGH.—F.M.

Bradford, Otley, Ripley, Ripton, Masham, Leyburn, Richmond, Aldborough.

CARDIFF TO BRISTOL.—S.G.P.

Cardiff, Newport, Chepstow, Lydney, Gloucester, Thornbury, Bristol. Approximately 95 miles.

NOTTINGHAM TO WEYMOUTH.—F.H.C.

Nottingham, Loughborough, Leicester, Lutterworth, Rugby, Frankton, Southam, Banbury, Deddington, Oxford, Abingdon, E. Ilsley, Newbury, Whitechurch, Andover, Salisbury, Blandford, Puddletown, Dorchester, Weymouth. Approximately 150 miles.

AYLESBURY TO ST. IVES.—D.S.H.

Aylesbury, Thame, Oxford, Faringdon, Swindon, Wootton Bassett, Chippenham, Bath, Wells, Glastonbury, Othery, Taunton, Cullompton, Exeter, Crediton, Bow, Okehampton, Launceston, Bodmin, Indian Queens, Mitchell, Zelah, Redruth, Camborne, St. Ives.

RICHMOND (YORKS) TO ASHBOURNE.—K.C.T.

Richmond, Catterick Bridge, Leeming, Boroughbridge, Wetherby, Aberford, Ferrybridge, Doncaster, Conisborough, Rotherham, Tottle, Baslow, Bakewell, Hartingdon, Ashbourne.

Patented Points—No. 10.

The Sidecar Lugs.

Many sidecar attachments throw all the strain upon the bolts. In the Royal Ruby patent lugs, ribs and recesses are provided in the frame-lugs corresponding with recesses and ribs in the sidecar lugs; these take all the strain and provide a perfect, mechanical joint. The heaviest sidecar is safe on a Royal Ruby.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 12 words or less 2/6, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.,** and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. Replies to Box Number advertisements containing remittances should be sent by registered post.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged; when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

Abingdon.

ABINGDON K.D., 3½ h.p., 2-speed, coachbuilt combination; 45 gns.; 1913.—Railway Garage, Staines. [9460]

4 h.p. Abingdon King Dick, Gradua gear, kick start just fitted, new handle-bars, tyres, lamp, and belt, being overhauled, ready ride away in fortnight; £40.—Box 3,397, c/o The Motor Cycle. [X9578]

ABINGDON, King Dick engine, 3½ h.p., F.E. pedal start, Bosch, new B.S.A. carburettor, new Dunlop belt, new Dunlop and Clincher tyres and tubes, Brooks saddle, £14/2/9 just spent on overhaul (receipt can be shown), mechanical condition as new, fitted with new lamp set, Klaxon, speedometer, mirror, to the value of £10; accept 40 gns., genuine bargain.—Apply, Hayns, 20, Chiltern Rd., Bow, E.C. [9160]

MOTOR CYCLES FOR SALE.

A.B.C.

CROW Bros., High St., Guildford, have contracted largely for the new A.B.C. Order now for earliest delivery. [5298]

A.B.C.—Earliest deliveries; your name on our book ensures this.—Martin Mitchell, Ltd., Wholesale Distributors, Stafford. [X9866]

A.B.C.—We are now taking orders for the new A.B.C. twin; order now for early delivery.—P. Ellis and Co., 360, Lillie Rd., Fulham, S.W.6. [8460]

LIVERPOOL and District Agents for A.B.C. Place orders now to secure early delivery.—Victor Horniman, Ltd., 9, Parr St., Liverpool. [0003]

A.B.C.—Sole agents for these famous machines. Orders booked now for early delivery.—Chandler, Reyre, and Williams, Sun St., Hitchin. [0996]

JONES' Garage.—We are in a position to accept orders for A.B.C. motor cycles; deposits optional delivery April or May.—Broadway, Muswell Hill, N. [0991]

ISLE of Wight.—Witham Bros., Newport, I.W. are Island agents for A.B.C. machines. Full particulars on request. Orders being booked for earliest delivery. [7515]

A.B.C.—Distributors for Scotland. Book your order now to ensure reasonable date for delivery.—Edinburgh Pioneer Motors, Ltd., 50, Grindlay St., Edinburgh. [X8301]

FANCOURT'S Garage, Stamford, for A.B.C.'s; sole distributing agent for Soke of Peterborough and County of Rutland; particulars and illustrations on request. [X9724]

NORTH AVSHIRE.—Place your orders now. Early delivery of A.B.C. Demonstration runs arranged by appointment. You are interested, so write.—Unwin, Glengarnock. [8976]

WE ARE NOW BOOKING ORDERS for earliest deliveries of A.B.C. motor cycle. Secure an early delivery by placing your order with us now.—Dunwells' Garage, Wigan, Tel.: 328. [X3219]

A.B.C.—Book early and prevent disappointment. Specification and full particulars will be sent on application.—The Spalding Motor Co., Ltd., Spalding, distributing agents for Lincolnshire. [X6909]

DAN BRADBURY, 224, London Rd., Sheffield, sole A.B.C. distributing agent for Sheffield and district, will give you earliest possible delivery of the new A.B.C. motor cycles and light cars. [7270]

A.B.C.—Sole wholesale and retail agents for Oxfordshire and part of Buckinghamshire. Early deliveries guaranteed. Enquiries re sub-agencies welcome.—The Layton Garages, London Rd., Bicester, or 90, High St., Oxford. A.B.C. enthusiasts. Phone: 35 Bicester. [9334]

A.J.S.

JACK HEALY, Cork.—Official A.J.S. agent.—Garage and works, Urrinan St. [X8336]

2½ h.p. A.J.S., 2-speed, clutch, tyres nearly new; £4 22s.—Lucas, Send, Woking. [9203]

CROW Bros., Guildford.—A.J.S. Agents since 1912. Write us for your requirements. [9777]

19 A.J.S. Combinations.—Write Merrick's Stores, 174, Listerhills Rd., Bradford. Phone: 2439. [X2436]

A.J.S. Spares, prompt delivery.—Cyril Williams, Chapel Ash Depot, Wolverhampton. Tel.: 9169. [9169]

A.J.S. 2½ h.p., late 1914, 3-speed, clutch, kick start, Bosch; £39.—Lewis, 6, Mattock Lane, Ealing, Broadway. [X9596]

2½ h.p. A.J.S., good condition, Senepray, Bosch, ready ride away; £22.—163, Tudor Rd., Hampton, Middlesex. [9055]

2½ h.p. 1916 A.J.S., 3-speed, all-chain, kick start, clutch, really sound condition; £65, or nearest.—Box 3,402, c/o The Motor Cycle. [X9580]

A.J.S. 6 h.p. Combination, 3 speeds, kick starter, good condition; accept £75; seen any time.—19, Fairfield South, Kingston-on-Thames. [9290]

A.J.S.—For quick deliveries try the sole Leicester-shire agent, Will Chapman, 113, Belgrave Rd., Leicester, the first appointed A.J.S. agent. [3531]

19 A.J.S. 6 h.p. Combination, fully equipped, just been thoroughly overhauled, good condition; £128; after 5—18, Hestercombe Av., Fulham. [9391]

19 A.J.S. Combination, Watsonian coachbuilt side car, perfect condition absolutely; £97/10.—Bromley Oswell, Handley, near Wellington, Salop. [X9791]

A.J.S.—Exeter Motor Cycle and Light Car Co., Ltd., Bath Rd., Exeter, and 28, Tavistock Rd., Plymouth. Sole agents. Now booking for earliest deliveries. [0007]

A.J.S. Combination, 1916, complete, as new; £135, first cash scrap.—Vivian Hardie, Ltd., 24, Woodstock St., off Oxford St., Bond St., London, W.1. Phone: Mayfair 6559. [8979]

Clutches and Variable Gears.

IN some cases a certain amount of confusion exists in the minds of many as to the difference between a clutch and a variable gear. This confusion of thought is not so much apparent when clutches and gears of the ordinary types are under consideration, for it is realised that a clutch is a friction device, the object of which is to take up the drive as smoothly as possible, whereas a gear is a more positive arrangement designed to give various definite relations between the engine and the road wheel. It is quite true that the road speed can be reduced while the engine speed remains constant by both clutch and gear, sometimes the one being more convenient, and sometimes the other. Briefly, the difference between the two is that in the case of the clutch the speed is reduced by a waste of power, and therefore the turning moment of the road wheel is not increased, but when the higher ratios, *i.e.*, the lower gears of a true variable speed gear, are brought into action the torque of the road wheel is very largely increased. Hence comes the greatly increased hill-climbing power possessed by a motor cycle on its lower gears.

This difference is also apparent when the machine is running at small throttle openings on the level, a change down of gear being sometimes followed by an increase of speed, because the engine speed rises under the lighter load. The engine speed will rise equally when the clutch is partly withdrawn, and for the same reason, but no increase of road speed takes place—rather the reverse; this clearly shows that the power is lost. On a hill the clutch is sometimes of value in enabling a machine to top a rise where the engine might otherwise konk out, but this is simply because the use of the clutch allows the engine to maintain or even increase its "revs.," and thus give out greater power than it does when losing speed.

If these facts were always kept in mind, we should not hear hydraulic and electric clutches

described as variable gears, for a hydraulic clutch is brought into action by allowing a certain proportion of the oil, or other liquid, which it contains to escape from one part to another, and this escaping oil does no useful work, but simply takes some of the load off the engine. Hence this is more correctly described as a clutch.

Caveat Emptor.

OWING to the rush for motor cycles ready for immediate use, many dealers are tempted to put up their prices to a somewhat high level. While this level does not exceed what is right and proper considering the high prices of practically every commodity and the high cost of labour, or, on the other hand, the decreased purchasing power of the sovereign, no one has any right to complain. Naturally the scarcity of new machines reacts upon the second-hand market and causes a general inflation of prices with the consequence that a good second-hand machine fetches, and is really worth, more than it cost when new. The prices obtained in the Government sales are proof of this. It is when high figures are charged for motor cycles in indifferent order that the buyer has a right to complain. Instances have been given in our columns of machines being purchased and taken away after only the most cursory examination. If a rider makes a purchase in this manner, he will certainly have himself to blame if the machine turns out to be unsatisfactory. When purchasing a machine from a private seller, a trial run should be obtained, and, if possible, a test made upon a hill. Naturally, in the case of a solo machine, the seller will not care to entrust his mount to a total stranger unless the value be deposited with him, but, if the buyer is in earnest, there should be no difficulty about this. If, on the other hand, a sidecar is for sale, the prospective purchaser can easily be given a trial run, with the owner on the saddle.

A Sale of Canadian Army Motor Cycles.

A 2 1/2 h.p. Douglas sold for 50 guineas

More Surplus
War Material
disposed of at
High Prices.

A 4 h.p. Triumph, which realised 69 guineas.

A BATCH of thirteen 1916 model 7 h.p. twin-cylinder Indian motor cycles was offered for sale at a sale of Canadian Army motor cycles which took place on the 5th inst. at the British Motor Cab Company's depot, 1, Brixton Road, London, S.W.9. The auctioneers were Messrs. Geering and Colyer, of Ashford, Kent.

The auction began at 11 a.m., and was well attended, about 300 people being present, which, once more, illustrates the interest of the public and the demand for motor cycles at the present time.

The Indians in question had recently been repainted a dark green, and presented a distinctly smart appearance, and were in fairly good condition, though the engines in some cases required the fitting of a few small parts. The auctioneer, in answer to a question, forcibly replied that he would give no guarantee for any of these machines—a remark which caused much amusement. The very last thing one might expect would be a guarantee for a disused Army machine.

One of the thirteen 1916 model 7 h.p. Indians sold at an average price of 58 guineas.

The average price paid for these motor cycles was 58 gns., and the highest price 100 gns. Four Triumph motor cycles were next offered for sale, the average sum of 62 gns. being realised. These machines were of the 1915 4 h.p. Army pattern. The condition of the engines in some cases was rather bad, and one mount, which fetched 60 gns., had the carburetter missing, as well as the

controls, front fork spring, and the sparking plug. The highest bidder paid 69 gns. for one of these machines.

Two Douglases, one 4 h.p. 1915 model, and one 2 1/2 h.p. model, were next put up for auction. The 4 h.p. mount, which had lost its clutch, chain wheels, exhaust pipe, silencer, plugs, and saddle, was bought for 56 gns. The other, in better condition, realised 50 gns.

The bidding was slow at first, but with the help of a clever and witty auctioneer, improved later to a firm competition, and on the whole the machines realised more than their full value.

A travelling workshop catering for motor cyclists in the Plymouth district. These motor vans have been in service for the aid of car owners for a long time, but up to the present very few garage owners have been sufficiently enterprising to cater specially for stranded motor cyclists.

Traffic Education.

WHILST the petrol famine temporarily reduced me to pedestrianism, or at least to unwontedly large doses of that over-rated sport, I noticed with grief how absolutely devoid of the road sense the average pavement user is. Once he or she quits the sidewalk, acute danger compels the pedestrian to aim at being alert and nimble; but on the sidewalk he has about as much road sense as a lost calf. He walks slowly along the dead centre or the wrong side, with his stick projecting, so that one eight stone man can block an 8ft. walk; she collects her friends, and wheels perambulators three abreast; they join arms, take corners on the wrong side, or pace to and fro in the Strand during the luncheon hour. I thought often and deeply that there was a loud call for instructional posters on the proper use of the pavement, such as the anonymous "Safety First" people have published anent hopping on and off 'buses or crossing the road. But I positively blushed at the way in which I saw motor cyclists drive during the holidays, and some of them men in khaki at that. They swirled out of by-roads at speeds that took them well over on to the wrong side of main roads, right out into streams of thick traffic. They cut blind corners. They created emergency after emergency by trying to overtake other motors round blind corners, or when oncoming traffic blocked the other half of the road. They turned down side roads abruptly without signalling or looking astern, often commencing a wheel from the centre of the "pretty," as golfers call it. All that could be said for them was that on the average they were very quick with their brakes in tight corners, and that everybody, whether sinned against or sinning, had a good-tempered grin, instead of an oath when the *bêtise* failed to result in slaughter or a crash. Why do not the A.A., R.A.C., and A.C.U. cease to spend our money on offering to get us licences which we are perfectly capable of obtaining for ourselves, and adorn tubes, 'buses, waiting rooms, bars, and other places of resort with merry pictures demonstrating the folly of overtaking a broad car round a blind corner in a narrow road, or otherwise courting a pink and messy death? Cyclists are equally guileless and unimaginative.

A Narrow Escape.

I HAD nearly broken my oath. My last paragraph had brought me to the brink of describing how a fat woman with a basket of eggs—when I recalled how a certain cycling club once saved me from committing manslaughter. Confession is good for the soul, so I may as well confess that I was in a great hurry, and I took a fairly easy bend in a broadish and remote highway much too fast. Imagine my horror on rounding the corner to find the road packed from hedge to

hedge with the serried ranks of a cycling club pedalling merrily in the same direction as myself. I could not stop in time, but they saved me. Somehow or other the outside men in each rank fell off their machines into the hedges, and the inner men did a one pace right or left close, as the case might be, leaving an alley right through their centre, down which I hurtled, grateful, but ashamed.

Gee-whizz.

I DO not use the above expletive for ordinary consumption, but it seems appropriate if inadequate on top of news I have just received. One of the gentry who once made a fat living by importing big twins tells me he thinks that the partial prohibition of imports will make way for a 33⅓% tariff in the late summer, and that he expects to sell as many big "seven-nines" as America can let him have, the British retail price being within smelling distance of £140! This item provokes quite a galaxy of stimulating thoughts. First of all, I did not know costs had risen in U.S.A. to such a height that a big twin plus Atlantic freights, insurance, and London profits came out at £105 (exclusive of tariff). Secondly, when supply overtakes demand, a selling price of £140 ought to spell a close season for those British twins which intend to oust the big Yanks from popular favour; of course, as long as our pockets are full and there are five buyers for every new machine available, £140 is a bagatelle; but if British makers cannot sell against a price like £140 in 1920, they will deserve all they get—I mean, lose. Thirdly, I wish I knew exactly why a large percentage of the big twin buyers in this country prefer Yankee stuff.

De Gustibus?

THE big American twins are charming mounts when they are new, but they do not (or did not) wear like Britishers. They are usually very well sprung forrards, and some of them are sprung aft as well. They have mechanical lubrication of a kind. They have walloping big tyres. They possess engines of the semi-woolly order, and pull superbly on top gear. But I am never quite sure why some of our riders have such a passion for the imported stuff, and I am not certain whether the American manufacturers themselves understand it. I am sorely tempted to place two factors high in the psychology of preference. One is that the machine as a whole is "different" from the British single on which the buyer probably served his apprenticeship, just as a Douglas gives you novel sensations after ten years on Triumphs. The other is that, though the design is not really "cleaner" than our own, it looks so; the machine seems more compact, and looks as if it had been planned as a whole, whereas some of our pre-war twins were spiky,

Occasional Comments.—

and bristly, and gave the impression that they were constructed of a number of ill-matched components fitted together. Finally, Yankee "service" is proverbially better than our own used to be.

The Time to Strike.

ANYHOW, a period of restriction followed by a continuation of high tariffs gives any British maker who knows how to design a twin a chance to strike. The Yankee twins are good, but they are not competition-proof; and the number of their '14 sales constitutes a market worth attack. Most of them give a rider more petty trouble than a first-class British machine, and the inevitable stage at which substantial repairs become unavoidable arrives earlier. They are quite absurdly heavy; 3 cwt. is surely excessive for a solo 'bus, and is not even to my mind pardonable on a sidecar hauler. The American front fork is good, but not better than two or three of the best European patterns: Americans have no essential monopoly of rear springing. Their much-boomed lubrication systems are not to be compared with the principles embodied in the new A.B.C. I am not by nature and preference a bestraddler of their cumbersome projectiles: I eschew sidecars, and find that a class 500 c.c. will do all that a solo man requires; so I must not be dogmatic on the secret of the spell that post office red or dove-grey with vermilion streaks has for so many eager buyers. I view the tug of war without animus. If the Yankee twins are really better, let them capture our 7-9 h.p. market, and let the British rival take its medicine like a man. I merely point out that the Britisher has a splendid opportunity to make sure of this threatened market, that the 1914 sales contain pointers to guide him in diagonalising public taste, and that now is the time.

The Sedan Scooter.

66 **E**VERYDAY Science "does not damn the scooter with faint praise. It anticipates the day when scooters will be fitted with coupé bodies. A pair of flat twins are to be mounted on each side of the steering head, and parallel to it,

driving the front wheel by chains ingeniously enclosed inside the front forks. A pair of aeroplane wheels are carried astern on tuck-up forks, and serve to steady the machine when stationary. How I should relish the ascent of Shap on this model against a stiff head wind! But perhaps the root idea is to utilise excessive wind resistance as an automatic speed limit. I commend this ingenious principle to future labour governments, who might compel all the *bourgeoisie* to affix steel discs eight feet in diameter to their front forks, such discs to be at right angles to the track.

Dishonest?

I HAVE just saved an impecunious novice from pouring his limited capital down the sink. He lives in a fearsomely hilly district, and the local roads during half the year are simply strips of morass. Knowing nothing of the sport or trade, possessing rather limited cash, and desiring immediate delivery, he got into the hands of a firm of dealers who had a baby two-stroke to sell, and had all but succeeded in dumping it on him plus a sidecar! I am ready to believe that, in certain comparatively level districts, an expert may obtain results of a kind with a first-class baby two-stroke and a sidecar. But to sell such a kit to a novice resident amongst mountains! To be frank, there were just a few makers' catalogues in 1914 which erred—shall we say, on the side of optimism? Lies never make a foundation for sound business: and unfortunately some of our greenhorns swallow all catalogue statements with a childlike faith. Our best firms write their catalogues with commonsense and self-restraint.

During the war we have had ample evidence of the motor cycle's great reliability in the hottest parts of the world. It is no great surprise to hear that it has proved equal to the task of negotiating the pathless ways within the Arctic Circle. The photographs sent by Lt. A. J. Roberts show a 4 h.p. Triumph outfit that successfully withstood most severe tests whilst with the Northern Russia Expeditionary Force.

ART AND THE SIDECAR.

With a
Few Suggestions
for Improving its
Utility and Comfort.

FIVE years, and with a war taking up almost the whole of it, is quite a short time when viewing the progress of art or industry, particularly so in any case where the two are allied, and it is a very short time ago since art and the sidecar seemed far removed from one another.

The primary object of the sidecar is undoubtedly to accommodate a passenger; alas, that now we are getting family sidecars to seat two and three people, though comfort is studied, the possibility of accomplish-

The many points contributing to a passenger's comfort:

- | | |
|---------------------------|-------------------------|
| A. Overall body room | F. Thickness of cushion |
| B. Door opening | G. Height of seat |
| C. Height and slope squat | H. Slope of footboard |
| D. Depth of cushion | J. Leg room |
| E. Thickness of back | |

ing this with any pretence to elegant appearance is very remote. It is also true that some designers strive mainly or totally for effect in looks to the entire exclusion of comfort.

The coachbuilt sidecar is, in nine cases out of ten, a sorry recommendation of the coachmaker's handicraft. There are exceptions, of course, the Canoelet being one of the best examples, but many are ill-shaped affairs covered with mouldings, transfers, ugly fittings, and that most detestable fad of the cheap coachpainters' art—a surfeit of fine lining.

To provide one comfortable seat is about as much as can be conveniently and satisfactorily managed on a sidecar chassis, anything more needing a larger chassis, which becomes unwieldy, unsightly, and certainly unfair to the cycle frame, to say nothing of the poor engine.

There is no reason that I can see why so many motor cycles and sidecars should be capable of improvement, and this opinion is supported by the few very smart turnouts one sees on the road, and I think perhaps the blame for this, as in all things, lies as much at the door of the buyer as the manufacturer. He accepts the sidecar as he accepts so much else which does not happen to be the thing he is buying—all accessories are evidence of this. He is scarcely in-

terested in the type of lamp and horn to be fitted—anything will do.

Then again, from the manufacturer's point of view, the attractive and comfortable sidecar—and by comfortable I mean not only comfortable cushions and back squabs, but protection from the elements—is going to be a telling factor in future sales, and, further, if this can be accomplished, it should aid the sidecar in competing with the light car.

Mention of protection from the elements reminds me that, when in conversation with a member of the trade the other day, the subject turned on sidecars and their equipment. He expressed the opinion that the passenger is no better off behind a screen than without one, and that a hood is all that is necessary. Very few sidecar passengers who have used sidecars with correctly shaped screens will agree with this. The correct type is one that is capable of being brought close up to the occupant and having side wings or alternatively a V or semi-circular type of shield. An elaboration of this idea is preferable to a hood and screen.

A Combination Hood and Screen.

A hood alone fitted to a sidecar, or any vehicle for that matter, appears to be the height of folly, as it serves as a veritable scoop for wind, and, of course, rain when that happens to come along. A hood made with a large celluloid light, and hinged as in a perambulator so that it might be used in either direction, would be a rather serviceable fitment in the absence of a more orthodox hood and screen. One illustration shows this suggested fitting. The Easting screen seems to be quite a good fitment, though the writer has no actual experience of it.

It should be understood that these remarks are applicable to the larger sidecars such as are fitted to

The celluloid screen and canvas apron to be operated independently or together, the side screens to be framed with aluminium.

Locker space, accessible from side or top, luggage platform to be covered with fluted rubber.

A DESIGN FOR A
TOURING SIDECAR

Art and the Sidecar.—

machines suited to heavy and continual two-passenger work; that is to say, nothing under 4 h.p. At present I have in my possession a well-known $3\frac{1}{2}$ h.p. V twin, and am so satisfied with its delightfully smooth running, coupled with plenty of power, that I am sorely tempted, in spite of the maker's advice to the contrary, to fit a sidecar. One reason why I have so far refrained is that the occupant of such an apology for a comfortable vehicle, as in justice to the motor cycle frame I should fit, would find little more protection and comfort than on the carrier seat, where the driver forms an admirable weather shield. I do not intend to enter here into the horse-power question; nor yet is it my intention in this article to uphold the cheapest (and I will not say least enjoyable) method of travelling for two.

The tendency of some builders to follow the lead of the "smart set" by designing sporty sidecars is, to my mind, to be deprecated, since many of the resulting atrocities are little more than slippers where one sits "on" rather than "in" the vehicle, which spoils the only saving point of the outfit's qualities—its smart appearance—by making it appear ridiculous in the eyes of the more staid motor cyclist.

Points Designers Should Consider.

The diagram given on page 485 illustrates a few of the points where protection is required and where the comfort of the passenger might be improved by a little studious attention from the designer.

The design I submit for consideration embodies many of the features suggested. Good locker accommodation is provided elsewhere than under the seat. Provision is made for carrying luggage by means other than unsightly and rattle-producing folding grills.

Amongst other means to the attainment of pleasurable pleasure sidecars—and by this is meant of pleasant appearance: a comfortable means of long or short distance travelling, and in every way the opposite

of a nuisance and a makeshift—I would suggest a more critical examination at competitions and club runs. A few of the points for which marks should be given are: (1) General appearance of complete vehicle, accessories, and luggage; *not* merely the design and condition of the body, though the condition, too, should receive attention as being an index of correct design and construction. (2) Comfort, *i.e.*, roominess, protection, ease of ingress and egress. (3) Utility, *i.e.*, luggage carrying capacity, etc.

The provision of a locker under the seat as the *only* place in which oil, carbide, tools, spares, extra large pumps, etc., can be stowed cannot be too frequently deplored, until the designer renders it accessible otherwise than by first turning out the passenger. Ample locker space can easily be provided at the rear of the vehicle, and that without rendering the body vastly heavier or more unsightly. Indeed, in my opinion, the appearance may be improved rather than otherwise in this manner.

Just a final word on colour schemes. I think we have had quite enough of camouflage, and I fancy, moreover, that dazzle has gone quite

far enough; at any rate, I am sure there are realms other than motor cycling to which their uses are more fitted. So, then, when we have a cycle whose colour is green with gold lines, may we hope in the future to find harnessed to it a sidecar similarly bedecked, and not sporting a post office red nor yet a chestnut hue, as I saw the other day? They all may be very beautiful, but to flash around the whole contents of the paint box on one outfit is to savour rather too flagrantly of the colour merchant's sample cards. In this respect I remember the earlier $3\frac{1}{2}$ h.p. Douglas, itself a pretty machine in its silver and blue, but the fitting of a sidecar, also in itself one of the prettiest, to wit, sage green with red upholstery, did not improve the *tout ensemble*. The parallel in car work would be the painting of the bonnet, say, a blue with green coachwork!

H. T. BALLEMY.

A suggestion for a hood-screen, to be used either as a screen or as a hood.

CHEAP FUEL IN THE FUTURE.

IN the current issue of *The Autocar* the question of cheap fuel is dealt with in an article on Natalite motor spirit. As the price of fuel will constitute one of the most potent factors in the future welfare of motoring, the statement that this fuel can be manufactured and sold at a price that would defy competition from the petrol companies is distinctly cheering.

Natalite, as we have already stated, owes its existence to the ingenuity of inventors in Natal, South Africa, and consists of 54.3% alcohol, 45% ether, 5% ammonia, and 2% white arsenic, the last named being suggested as a denaturant. *The Autocar* says that those who have carried out road tests with Natalite extending for as long as six months seem perfectly satisfied that the fuel has no harmful effect on the

engine, and they claim that with it they get practically as much power as from petrol. No motorist in the United Kingdom has yet had an opportunity of substantiating these claims, but that they are capable of confirmation seems probable from the opinions held and published by a large number of expert chemists in various parts of the world.

The one thing which now stands in the way of the use of Natalite fuel in this country is the Excise regulation. We do not think that the Excise authorities are immovable, and we have reason to believe that, if they can be convinced that a suitable denaturant which will render the alcohol undrinkable will be employed, they will not raise insuperable obstacles to the manufacture or importation of Natalite.

EXPERIENCES WITH A 3 h.p. TWIN.

An Appreciation and Some Criticism of an Interesting Mount, based upon a Year's All-weather Riding.

TO combine a general average speed of 30 m.p.h. with petrol consumption of 105 m.p.g. is not the rule with light-weights, yet this can be stated without exaggeration to be the regular behaviour of the 3 h.p. V twin Enfield, which the rider has used constantly for a mileage of four thousand. The machine was used for week-end journeys of about one hundred miles each way, with occasional business runs.

It was purchased early in 1917, and its first run was on snow-covered roads with a return during the subsequent thaw over half-flooded roads—a rough test through which it behaved excellently. At first it promised to be a mud-slinger, which was partly due to the speed—30 m.p.h. riding for long through watery slush is bound to produce a very dirty machine and rider, but the machine always held the road in grease exceptionally well; not the slightest tendency to side-slip was experienced during the whole of its use.

These journeys were kept up at intervals of two or three weeks for some nine months. Several times the run of ninety odd miles was made without a stop in approximately three hours, and never did the journey occupy longer than four hours. The only involuntary stops were through comparatively trifling things, a broken throttle wire being the most troublesome; lack of power was noticeable only once or twice, and on one occasion the nuts securing the magneto drive casing and magneto platform worked loose through vibration.

Speeds.

The highest speed recorded (and the speedometer has proved to be very accurate) was 46 m.p.h. No doubt if specially tuned for speed, it would exceed 50 m.p.h. It was not this good figure which was the chief attribute in speed; it was the steady way in which it would keep humming at 30 to 35 m.p.h. There was an unobtrusiveness at this speed which often caused the rider to suspect that the speedometer was recording inaccurately, but a good total time for the jour-

The writer's 3 h.p. Enfield. Note the carrier box, which protects a small leather travelling case, also the handle-bar muffs; they proved very cosy.

ney always dispelled this doubt. A repeated average of 30 m.p.h. on a hundred mile journey, which includes eight to ten miles of town traffic, is an excellent performance for a 3 h.p. machine.

Petrol Consumption.

105 m.p.g. is not a careless computation, but the amount of petrol purchased divided into the mileage without any allowance for waste. This was obtained without any special fittings except the substitution, for the original air inlet, of a curved intake serrated to fit between the fins of the back cylinder. All possible points of air leakage in the induction pipe and carburettor were carefully wrapped with insulating tape.

No freak hill-climbing was attempted, but the engine hardly ever required second speed on ordinary main road hills; therefore I should say that the machine possessed excellent hill-climbing abilities.

It was very light on tyres, but the back tyre was renewed after 2,500 miles by reason of a bad gash which rendered it nearly useless.

The consumption of lubricating oil was not checked very carefully, but it was somewhere in the neighbourhood of 1,800 m.p.g.

I have nothing but praise for the well-known Enfield gear and shock absorber; the latter was particularly efficient, and, to my

The hot air intake. Observe the tape-wrapped carburettor joints.

Experiences with a 3 h.p. Twin.—

surprise, when recently dismantled for examination, the rubber blocks showed no sign of wear or loss of resilience.

The engine was not touched until some 3,000 miles had been covered; there was practically no sign of wear and no unusual amount of carbon deposit.

Now for some points of criticism, which are intended in a spirit of friendly opinion and in no sense expressing dissatisfaction.

Starting.

On very cold mornings, it was extremely difficult to start; exactly why this was so, I was unable to ascertain. Certainly poor quality petrol was part of the trouble, but not all; a pair of Parker vaporisers fitted in the induction pipe gave some little improvement. Once started there was no further difficulty.

Comfort.

I cannot entirely recommend the machine for a tall rider (but then, very few lightweights are suitable for people over six feet), but the medium or short rider should find it quite as comfortable as most machines without spring frames. The best position I could find produced discomfort on a long run, but the fault lies chiefly in my own 6ft. 2in.

One point of detail which needs alteration is the filler cap of the glass oil reservoir; being about $\frac{3}{4}$ in. diameter and only projecting about 1in., it is very nearly impossible to pour oil directly into it from the ordinary can. I suggest that the diameter be increased to at least two inches, and it should project more and be formed with a cup as shown in the adjoining illustration.

Undershield.

An efficient undershield and magneto cover are badly needed, and I would recommend a complete redesign of footboards incorporating with them, in one unit, an undershield, leg-shields, and magneto cover, having a short extension backwards under the driving chain;

the front wheel has an annoying way of spraying mud on the underside of the countershaft sprocket.

Kick Starter.

The forward position of the kick-starter and direction of push is distinctly awkward, and I gave up the use of the kick-starter and almost invariably started by paddling off in low gear. I think a new type of starter should be fitted behind the engine with an action which will enable the rider to employ his weight to better advantage.

Magneto Staging.

The method of carrying the magneto on an extension of the driving chain covers is not so good as it might be. Only three of the five small bolts carry the weight, and they in turn take their support from the timing case cover; the hinged supporting strut under the magneto platform is of very little use. When the outer cover plate is removed, the whole casing and the magneto on its platform sags over for want of lateral support. The cover plate should be removable without affecting the support of the magneto in any way, and the magneto platform should have lugs to clip it to the down tube; the inside half of the magneto driving chain cover should be cast in one with the timing case cover.

The question of control wires inside or outside the handle-bars has been oftentimes a bone of contention. I am not personally enamoured by the Enfield method of enclosing the Bowden wires or the fixed lugs to carry the levers, though both these are neat.

Despite the points indicated, I shall still take an Enfield before many other makes, when I require a fast, reliable, solo lightweight; and I retain memories of many enjoyable runs on this interesting machine.

F.A.S.

[The magneto fixing has given no trouble on a similar machine in our possession, and as regards the writer's trouble in starting, this is certainly curable. Only the combination of frost and No. 3 war spirit has caused sluggishness in our case.—ED.]

In place of the small oil filler cap provided, a suggested alternative is shown.

STAINLESS STEEL.

IT is only a question of time when the entire motor cycle industry will recognise the enormous use that can be made of stainless steel, and it may be expected that many makers in the future will use it for valves and exposed metal work.

Stainless steel is a chromium alloy steel, with the composition of 12.5% chromium and very low, .28%, carbon, the rest being iron and the usual impurities. Its outstanding peculiarity is that it is perfectly impervious to atmosphere corrosion.

As regards its mechanical properties, it can be given any desired tensile strength (and so hardness) from 40 to 100 tons per square inch by suitable heat-treatment. It also shows a remarkably high resistance to fracture by impact upon it; in the well-known Izod impact testing machine it required eighty foot-pounds to break a notched test piece.

From these data much can be gathered. Enamel work can be dispensed with, and, if desired, an entire frame be made with it, as it can be readily drawn into tubing. It can be pressed into rough or accurate shapes for control levers and nuts. Spokes and rims can be made of it with the greatest of ease. Of course, its greatest work can be done for valves, scaling is unknown with rustless steel valves.

Its great fault is that it cannot be easily cast owing to its high melting point (about 1,400° C.), thus it is out of the question for cylinders and crank cases.

Probably the present cost of this steel, which, owing to the high price of chromium, is large, will prohibit its use for frames, but, otherwise, there is no reason why the rest of the machine should not be manufactured from it.

— ARTHUR GOFFEY.

Times to Light Lamps.

SUMMER TIME.

May 15th	...	9.12 p.m.
" 17th	...	9.15 "
" 19th	...	9.17 "
" 21st	...	9.20 "

The Paris Fair.

We understand that an A.B.C. motor bicycle is being exhibited on stand No. 39 at the Paris Fair, which opened on April 26th. The Paris depot for the sale of this machine is at 39, Rue Auber.

Petrol Imports.

16,090,485 gallons of petrol were imported during April as against 4,645,372 gallons for the corresponding month last year. The total amount of petroleum (which includes petrol, lamp oil, and fuel oil) imported, however, was only half as much as in April, 1918, the quantity being 40,388,128 gallons.

Boche Methods.

We have received an enquiry from a Belgian firm of cycle and motor cycle makers, Etablissements Scaldis, Antwerp. The pathetic nature of the letter will be understood when we point out that the firm are asking for the names of manufacturers of British plating accessories. The Germans stole the whole of their nickel-plating plant, and as they despair of ever getting it back they are turning to Britain to supply them.

Doubtless some Boche is making use of the stolen plant, and rubbing his hands with glee at being able to obtain it so easily. It was by such dirty methods as these that the Germans hoped to win the war and annex the world's trade not only in bicycles and motor cycles, but everything else.

Imports and Exports for April.

The value of motor cycles and parts imported under licence during April amounted to £1,535. In the near future, however, as we have already stated, imports are likely to be greatly increased, and firms will be allowed to import half their 1913 quantities.

EXPORTS.

The comparatively high figures of the March exports of motor cycles and parts were not maintained, in April the amount being £62,076 as against £154,202. But there are several factors that account for this sudden drop, the chief one being the difficulty in connection with transport and shipping.

BRITISH EXPORTS OF MOTOR CYCLES.

April 1917.	April 1918.	April 1919.
£72,824	£63,117	£62,076

A Good Performance.

The new Douglas described recently was a short time ago driven with sidecar and passenger non-stop from Bristol to Porlock, sixty miles, in about two hours, and the hill was taken on the run without a stop. It climbed good and well without hesitation. The days are not far behind us when Porlock Hill was considered unclimbable.

A New French Motor Cycle Paper.

A copy of *Motocyclisme*, a new French motor cycle paper, edited by our friend, M. Gaston Sweerts, 1, Cité Paradis, Paris, is to hand. M. Sweerts is closely in touch with motor cycle affairs both in France and in England, and he pays in his paper a just tribute to the excellence of the English motor bicycle. The paper shows promise, and, if properly supported by the motor cycle trade in France, should be a great success.

Bearing upon Motor Cycles.

Under the heading "Why Bearing Reins are Needed," a letter appears in a daily paper under the name of Mr. Walter Winans, which states that if bearing reins were stopped few coachmen would be able to prevent their horses from running away. He then goes on to say that "motor cycles are allowed to go at railway speed in traffic, with open silencers making a terrific noise, back-firing. I actually saw one man stop his motor cycle in the middle of the road, purposely let off a series of shots like deafening machine gun fire in order to clear his tubes (*sic*), scattering the horses in the road in all directions." It is a little difficult to understand what this well-known sportsman means. Few motor cyclists would deliberately offend in this manner.

Special Features.

BALANCING THE SINGLE.

ART AND THE SIDECAR.

A RUNABOUT WITH FOUR-CYLINDER V ENGINE.

Prices in U.S.A.

As examples of prices ruling in the U.S.A. to-day we quote those of the Thor motor cycle—a name not altogether unknown in this country. The 16 h.p. (approximating to the big twins of this country) with three speeds is £67 14s., electrically equipped £77 10s. A smaller twin (about 5-6 h.p.) sells at £57 10s., and a big single at £47.

A.A. First Aid.

To assist members having mechanical breakdowns of their cars and motor cycles, the A.A. and M.U. has instituted a service of "first aid" motor cycle combinations. These vehicles are equipped with the necessary tools for dealing with roadside troubles, and are driven by competent mechanics. In addition to spares, covers, and tubes, first aid necessities for personal injuries are carried, also stretchers to enable serious accidents to be promptly dealt with. These machines are working in close conjunction with the A.A. system of roadside telephones, and can be summoned by the patrols in charge of the sentry boxes at the behest of members needing their services.

HEAVY TWIN AND LIGHT SIDECAR

A Harley-Davidson with a sporting sidecar owned by Mr. R. Vaughan, of Birmingham, who demonstrates that the little Canoelet shown is quite suitable for heavy as well as light machines.

Competitors in the Hull Autocycle and Light Car Club's reliability trial held last Saturday.

The Six Days Trial.

We have remarked several times that the leading trials organising bodies might give a fillip to the development of the lightweights by special considerations being given to them in the big trials. We are pleased to observe that the A.C.U. has decided to pay particular attention to low-priced and lightweight machines in the Six Days Trial. It will unquestionably encourage the production of the cheap and moderately priced motor cycle.

Revised Prices.

Several makers have been compelled to raise their prices. The Excelsior two-stroke two-speed is now £58 16s.; with kick-starter, £63; single gear, £50. Four-stroke J.A.P. model two-speed, £60 18s.; with kick-starter, £65 2s. The Douglas 4 h.p. model is £85; with sidecar, £105; 2½ h.p. Douglas, £60. Ivy two-stroke single speed, £45 3s.; two-speed, £53 15s.; I.O.M. sporting models, single speed, £48 7s. 6d.; two-speed, £56 19s. 6d. A.J.S. sidecar, £148; motor cycle only, £110 5s.

New Models in the London-Edinburgh.

Several veteran competition riders will compete in the London-Edinburgh event this year on new models. Hugh Gibson, the old Bradbury rider, and one of the finest exponents of the single-cylinder machine, and also the holder of the Land's End-John o' Groat's record, will drive a new model spring frame Clyno. A. C. Robbins, the winner on an L.M.C. of the Manufacturers' Trophy in the last Edinburgh run, will this year ride the new Wooler flat twin. J. S. Holroyd, of Motosacoche fame, will appear on an 8 h.p. Blackburne with outside flywheel. E. Bridgman will be mounted on the 1919 Indian, Rex Mundy on a Victory Matchless, W. Cooper and E. M. P. Boileau on 3 h.p. A.B.C.'s, and J. Stevens on the latest A.J.S. Jack Haslam, the Sheffield rider, who won a special award by piloting a 3½ h.p. Premier sidecar through the last Six Days, will ride a 4 h.p. Douglas. Almost every new make and new model, it is anticipated, will be represented.

The A.A. and Petrol Licence Refunds.

The Petrol Control Department has authorised the Automobile Association to receive applications for refunds in the case of licences, which, after Saturday next, still contain unused vouchers.

The Zenith Flat Twin.

The Zenith Co. is the latest aspirant to the flat twin market. A new 2½ h.p. opposed model with the Gradua gear will be introduced this year, and probably will have a pressed steel frame on the lines of the Zenith design already described.

Accessibility.

"The word 'accessibility,'" said Mr. E. Tilston, at a recent meeting of the I.A.E., "should be posted all over the premises of motor cycle manufacturers, even at the risk of the workers taking to themselves the assumption that the managing director should be more get-at-able in future and listen to their grievances.

More Government Sales.

On Saturday week there will be the first of an important series of auction sales of Government motor vehicles, which will be held through May and June at the Royal Agricultural Hall, Islington.

We understand from the auctioneers, Messrs. Goddard and Smith, 196, Piccadilly, London, W.1, that some hundreds of motor cycles will be put up for auction. The sales are to be held on Saturday, so that all motor cyclists will have an opportunity of attending.

British Industries Fair at Birmingham.

With the object of maintaining and extending British trade, a British industries fair is to be held in Feb., 1920. This exhibition will be of a different nature from anything yet attempted in this country, and will be held in every available building in the city and, if necessary, a series of kiosks and stands will be erected in the squares and main streets. About twenty different industries will be represented, including a section embracing motor cycles, cycles, and cars.

The Motor Cycle Industry and the Board of Trade.

The Coventry Chamber of Commerce is making energetic efforts to reduce the present high rates on passenger train goods traffic, which is hampering the development of commerce throughout the country, and Mr. Marwood, permanent secretary to the Railway Department of the Board of Trade, has offered to place the matter personally before Sir Albert Stanley, the President. It will be remembered that, last month, Mr. Edward Manville, M.P., on behalf of the Chamber, was able to remove the restrictions on the conveyance of motor cycles by passenger train, by taking the matter up with Sir Herbert Walker, acting chairman of the Railway Executive Committee, which signifies that the Government apparently now appreciate the importance of the motor cycle industry.

A Strenuous Trial.

The Midland Cycling and Athletic Club One-day Trial fixed for Saturday, June 28th, is, by all accounts, to be quite a strenuous affair. The course has been fixed at not less than 200 miles, and a great deal of country unknown so far as trials are concerned will be traversed.

Into the conditions will be introduced flexibility hill climbs and brake tests, special attention being given to the latter point, and failure on such tests will mean total elimination.

A novel feature will also be introduced, by checking times to the police regulation limit through one of the county towns *en route*. This will be done in order to show that the present limit of ten miles per hour is probably more dangerous to the general public and motor cyclists than a reasonable speed.

London-Edinburgh Entrants to Date.

The list of entrants for the London-Edinburgh run at Whitsuntide continues to grow. Quite a large number of competitors will ride new models produced since the Armistice.

A RUNABOUT WITH A FOUR-CYLINDER V ENGINE.

A New Four-wheeler to weigh 6 cwt. which will be fitted with a Four-cylinder 500 c.c. Sleeve Valve Two-stroke Engine.

The Parr-Eagle runabout as it will appear when completed.

EMBODYING a diminutive four-cylinder engine of less than 500 c.c. total capacity, the runabout illustrated has been designed to approximate to the de luxe sidecar on the points of weight and cost.

This new vehicle will be known as the Parr-Eagle "twin-two ten," as its engine will be of the V type with four cylinders, a twin-two, in fact, and the nominal horse-power is to be ten.

As the drawings indicate, the layout is attractive, and the general appearance of the finished car will be quite good.

With a pressed steel frame, sheet metal body, 30x3in. tyres, and pressed steel-domed mudguards and running boards, the weight is to be 6 cwt. only. Castings will be employed at no other points than in the engine, the car being built almost exclusively of pressed steel. The whole design, in fact, has been produced to embody the following features, which are given in the order of their importance in the estimation of the makers:

(1.) Applicability to cheap quantity production. (2.) Economy in running, which is to compare favourably with a good sidecar. (3.) Reliability: to run at least twelve months without any attention whatever. (4.) Foolproofness: to be incapable of being damaged by bad driving.

Air-cooled Four-cylinder Engine.

The engine is described as an 8-10 h.p. (nominal), high speed, high efficiency, air-cooled four-cylinder, twin-two, sleeve valve two-stroke. With a bore and stroke of approximately 52 and 59 mm. respectively, the total capacity is under 500 c.c., and the car will come inside the

two guinea tax. We are not permitted to give full details of the engine; it must suffice to say that it has a high compression and forced induction, and is said to be completely scavenged and internally cooled.

According to present day standards, an engine of this size appears absurdly small for even a 6 cwt. vehicle, but we know that a 11 cwt. light car has been running about the London district for the past three years which is fitted with a similar engine.

Roller bearings are to be fitted in the big ends, and the 90° crankshaft is of the built up type. Die cast aluminium pistons, too, are to be fitted.

Double Ratio Intermediate Drive.

The designers of the Parr-Eagle runabout considered that friction transmission has so many advantages over the gear set method of ratio variation that an endeavour to eliminate its more outstanding faults was amply justified. Briefly, these faults in friction drives, as usually applied to automobiles (industrial drives are generally quite satisfactory), are: Short life of friction composition, inefficiency, and low starting torque.

The first two faults mentioned are caused almost entirely by the high pressure between the discs necessitated by the small reduction possible in the final drive, while the third is due to the reduction in the coefficient of friction when slip is occurring.

In this vehicle these disadvantages are reduced by the incorporation of a double ratio final drive, which decreases the

torque on the driven friction gear on low gears, when slip is most liable to occur.

A clutch is fitted in the flywheel in order to obtain a high starting torque, and also to avoid the additional wear on the friction discs when they are used for this function, as is almost general practice.

From the dry plate clutch in the flywheel the power is transmitted through a shaft having two fabric universals to the friction set which more or less follows conventional practice. From the cross-shaft carrying the driven friction wheel two silent chains transmit the drive to a second cross-shaft which has dog clutches for engaging one or the other of the silent chain transmissions as required. These have different ratios giving two speeds without the use of the friction set as a variable gear, hence the lower speeds provided by the friction discs alone are not required. The final drive is by roller chain to a live axle.

The friction discs and dog clutches are all operated by one lever moving in a gate, while the clutch pedal first releases the clutch and then withdraws the disc. Three forward speeds and a reverse are provided, and an under screen encloses the whole of the mechanism.

Two further features worthy of mention are the seat starter, which is said to be smooth and silent in action, and the proposed lighting set, of which the dynamo may be of the "flywheel" type.

Front Wheel Brakes.

A transverse spring is used at the front and "compensated" cantilever springs at the rear which will be seen in the accompanying drawings. The front axle is of pressed steel elliptical in section, and brakes, enclosed in oil tight housings, are fitted to each front wheel. The rear axle is tubular with the driving spocket and brake drums at the centre, substantial radius rods being embodied to take side, driving, and braking stresses.

The wheels are of the pressed steel disc type with detachable rims, and steering is by 14in. wheel and irreversible gearing. The wheelbase of the vehicle is 8ft. and the track 4ft.

Altogether the Parr-Eagle is a design of great interest at the present time, and no doubt its development will be eagerly watched. We hope to avail ourselves of an invitation to try one of the experimental chassis which are to be produced during the summer, when the performance

Plan view showing the miniature engine and details of the friction drive.

A Runabout with Four-cylinder V Engine.— of the miniature engine will be duly recorded in *The Motor Cycle*.

In the meantime, it may interest readers to know some of the considerations which led the Parr-Eagle Co. to adopt the V four-cylinder two-stroke as a power unit, and below we give the designers' statement on this point:

"It was considered that for the purpose under discussion an engine should embody the following features, in the order of importance given:

"(1.) Fuel efficiency (above every other consideration).

"(2.) Reliability.

"(3.) Cheapness of manufacture.

"(4.) Simplicity.

"(5.) Absence of vibration.

"(6.) Lightness.

"Considerations (3) and (4) indicated a two-stroke cycle as desirable, but (1) precluded the use of the Day cycle, which is basically inefficient.

"It therefore seemed that a new cycle or an adaptation of an existing one was necessary. A two-stroke modification of a cycle devised by Sir Dugald Clerk was finally decided on as satisfying the conditions laid down in (1), (2), (3), and (4).

"Consideration (5) gave considerable trouble, as a 180° twin two-stroke was abortive, owing to the uneven torque obtained. It was noticed, however, that the adaptation of a cylinder to embody the cycle referred to above had resulted in a design that in a 90° engine would give a mechanism in which only the quite negligible fourth harmonic was unbalanced.

"A 90° two-cylinder, however, gives a very erratic torque curve, and it was therefore decided to employ a four-cylinder two-crank design, as this gives four equally spaced power strokes per revolution (equivalent to an eight-cylinder four-stroke).

"Theoretically, the design gives unbalanced stresses one-forty-sixth of the magnitude of those obtained in a four-cylinder four-crank vertical of the same cylinder capacity, and one-sixteenth of those in a 90° two-cylinder, but practically the balance is considerably better than in a 180° twin of the same power.

"Owing to the very high overall efficiency inherent in the cycle (about 20 h.p. litre=50 c.c. per h.p. at normal speeds), the engine can be made very small, thus satisfying condition (6)."

TWO MORE MOTOR SCOOTERS.

Recent Patents in Great Britain and U.S.A.

IN all probability the revenue of the Patent Office during the next few months will be increased by fees for patents relating to motor scooters. Apparently the interest in this type of machine is not confined to this country, and inventors in the land where the Auto-ped is produced are endeavouring to design scooters, some of which leads one to suppose that there are others besides *The Motor Cycle* who ask the question, Why stand?

On this page we illustrate one of the latest American designs, which incorporates a Smith Auto-wheel and a sprung bucket seat. This is the subject of a patent granted to Mr. Jas. J. Dragner, of New York City, and shows that only a narrow margin exists between the motor scooter and the lightweight on orthodox lines, as, so soon as a seat is fitted, it becomes a miniature motor cycle.

Thus it would seem that if the motor scooter is to secure a place in the world of mechanics as a separate type of vehicle, it must remain a scooter pure and simple, and its one point of advantage over the lightweight motor cycle, i.e., compactness, must outweigh the points of superiority of the slightly larger vehicle with its higher power and greater sphere of utility.

An English Design.

Another invention illustrated is the patent of London engineers, and conforms more to the original scooter idea, but again, the design invites criticism on the points mentioned above. Here we have a scooter without the scooter's greatest and most appealing feature, viz., its apparent simplicity.

The inventors state that "preferably the rear wheel is driven by a belt, and a torque rod, having a right and left-hand screw to enable its length to be adjusted to the belt tension, is provided to keep the driving wheel in position. . . . By disconnecting the torque rod, the rear wheel can be removed without altering the adjustment of the bearings thereof."

It will be seen that the machine is intended to be sprung fore and aft by laminated springs, while the engine casing constitutes the main frame of the vehicle. Tubes play a very small part in the construction, and are confined to the steering pillar, upon which is carried the petrol tank. The control is by twist grips, and it is suggested that the wheels be of the disc type, on the lines of those fitted to the Auto-ped described last week.

An American design that incorporates a Smith Auto-wheel as the power unit.

A British patent which conforms more to the lines of the original scooter than many recent designs have done.

THE BIRMINGHAM-LAND'S END WHITSUNTIDE TOUR.

SECOND in importance only to the London-Edinburgh run, the Birmingham M.C.C. Whitsuntide trial to Land's End and back for the Lycett Trophy has always been a popular event, especially with Midland riders. Particulars of this event are now available. The start will be from Birmingham on Saturday, June 7th, returning from Penzance on the following Tuesday. This gives the competitors two clear days' rest between the two journeys. The route outwards will be Birmingham, Stroud, Bath, Bridgwater, Minehead, Porlock,

Lynton, Blackmore Gate, Barnstaple, Launceston, Bodmin, Penzance, Land's End, and the return journey Penzance, Liskeard, Tavistock, Two Bridges, Ashburton, Exeter, Taunton, Bath, Stroud, Birdlip Hill, Cheltenham, Evesham, Birmingham.

The Lycett Trophy and gold medal will be awarded to the competitor who makes the best performance, and all competitors who are not more than 2m. early or late at any check, and who climb the observed hill, will receive a gold medal. Those who fail to gain a gold

medal, but who are not more than 4m. early or late at any check, will be awarded silver medals, and bronze medals to all who complete the outward or return journey within 45m. of schedule time.

Marks will be awarded for the Austin Challenge Cup, and photographs taken on this run are eligible for a photographic competition instituted by the club.

Applications for membership of the B.M.C.C. should be made to the hon. secretary, Mr. W. H. Egginton, 76, Earlsbury Gardens, Birchfield, Birmingham.

TWO-STROKE ENGINES FOR MOTOR CYCLES.

Review of a Paper read by Mr. E. Tilston before the Institution of Automobile Engineers.

WITH Mr. A. A. Remington in the chair, the Institution of Automobile Engineers held its last meeting of the session at Birmingham on Thursday of last week, when Mr. E. Tilston, designer of the Tilston piston valve engine, read a paper on "Two-stroke Engines for Motor Cycles."

Among those present we noticed several designers of two-stroke engines, including Messrs. W. Hughes Butterfield, G. Funck, W. L. Lechmere, J. Duffy, and G. E. Stanley, while Messrs. J. E. Greenwood, W. W. Bowkett, A. E. Parnacott, J. L. Norton, and many other well-known figures in the trade were present.

The author's opening remarks were full of optimism concerning the future of the two-stroke engine, which, he stated, will be suitable for all types of motor cycles, cars, and aeroplanes when the right design arrives.

"To commence with," Mr. Tilston continued, "it is perhaps as well to enumerate the advantages which designers of internal combustion engines look for in determining the type of engine to adopt."

1. *Power per c.c.*
2. *Torque.*
3. *Reliability.*
4. *Good balance.*
5. *Absence of vibration.*
6. *Simplicity.*
7. *Low cost.*
8. *Economy of fuel.*
9. *Ease of starting.*
10. *Accessibility.*
11. *Flexibility.*
12. *Best type of engine for frame design.*

13. *Light weight.*
14. *Silence.*
15. *Durability.*
16. *Cooling.*

The exponents of the two-stroke engine claim that the twelve advantages which appear in *italics* are found in this type of engine.

The present type of three-ported two-stroke engines gives about one-third more power than the four-stroke engine for the same size of cylinder with the engine revolving at normal speeds, although the power curve falls away more rapidly than with the four-stroke engine at abnormal speeds.

The two-stroke engine appears to be the best type for frame design, inasmuch as torque and balance (which minimise vibration), total weight, and weight of reciprocating parts are in its favour.

Reliability.

There can be no doubt that the present-day two-stroke engine is very unreliable for large horse-powers. In the first instance, it is necessary to bear in mind

that there are two power impulses against one in the four-stroke engine, consequently the moving parts, especially the piston and small end of the connecting rod, are more likely to get over-heated. This is counterbalanced to a certain extent by the fact that a new cool carburetted charge is drawn into the crank case every revolution; this lies inside the piston, and tends to keep these parts cool. In the present-day two-stroke engine there are other reasons for overheating, viz., the exhaust port is arranged at the lower end of the cylinder, and the hot burnt gases do not tend to escape, consequently the piston in ascending is subject to the heat from the exhaust. It must be admitted that even in small two-stroke engines of 250 c.c. it frequently happens that the engine peters out on a fast run of fifty miles or so. For further proof

The Tilston air-cooled two-stroke engine, with piston valve controlling exhaust port at top end of cylinder, the displacement of which helps the main piston to fill cylinder with new charge.

of the evil effect of exhausting at the lower end of the cylinder, it is only necessary to examine the top piston rings on the exhaust side of any two-stroke engine, and they will be found caked up with carbon, and often require cutting out after a few hundred miles run. To sum up, the disadvantages of exhausting at the lower end of the cylinder are as follows:

Loss of incoming charge through the exhaust; imperfect scavenging; overheating of the piston, which is increased by the deflector; and caking of piston rings

with carbon on the exhaust side, all of which add considerably to unreliability and waste.

Economy and Flexibility.

The large difference in economy of fuel between the present-day two-stroke engine and the four-stroke engine is no doubt due to the loss of incoming charge through the exhaust, combined with the large amount of burnt gases in the cylinder. Remove these two evils, and there is no reason why the two-stroke engine should not equal the four-stroke engine as regards economy.

It would naturally be imagined that the two-stroke engine would be more flexible than the four-stroke engine, seeing that a single-cylinder two-stroke engine is equal in power impulses to a two-cylinder four-stroke engine, and there can be no question but that by increasing the number of cylinders flexibility is improved. In the author's opinion, the reason why the two-stroke engine is actually not more flexible than the four-stroke engine is that there is a greater amount of exhaust gas left in the cylinder on the compression stroke than is found in the four-stroke engine. If all the exhaust gases can be ejected from the cylinder, at every position of throttle opening, the flexibility would increase in proportion to its superior torque.

The following are points that are desirable and those that are best got rid of:

Undesirable.

The deflector on the top of the piston.
The exhaust at the lower end of the cylinder.

Valves.

The waste of the incoming charge through the exhaust.

Desirable.

The cylinder scavenged from end to end through a ring of ports and an annulus.

A light flat topped piston.

The incoming charge must fill the cylinder completely with the throttle fully open.

No exhaust left in the cylinder at any position of the throttle.

Both inlet and outlet must be unobstructed to allow free passage, otherwise back pressure of the outgoing exhaust prevents the new charge from entering, and diffusion of the two results in the escape of the new charge through the exhaust. If these ideals are accomplished, it is possible to double the power as compared with the four-stroke engine for the same c.c.

The combustion space represents roughly 20% of the cylinder volume, and if this could be filled with a new charge and fired twice, as compared with the

Two-stroke Engines for Motor Cycles.—

combustion space in the four-stroke engine, which is filled with burnt gases and fired once, then the possibility of increasing the power of the two-stroke engine may be more than doubled.

The two-stroke engine for which the author is responsible is the result of very careful consideration of the merits and demerits of both types of engines on the lines laid down.

In this engine means are provided to control the exhaust port (the piston valve) which gives additional displacement to induce a sufficient charge into the crank case from the carburetter, which the movement of the piston alone fails to accomplish.

The Principle of the Piston Valve.

The lower end of the piston and piston valve are both open to the crank case, and as they move upwardly together, their combined displacement is available to fill the cylinder at the end of the next downward stroke of the piston. On the explosion stroke, the closing of the port from the carburetter to the crank case first occurs, followed by compression of the charge in the crank case. The opening of the exhaust at the top end of the cylinder follows, and shortly afterwards the inlet ports from the crank case to the cylinder are opened by the main piston.

When the explosion takes place, the piston valve is at the top of its stroke and is considerably above the combustion space. The cool carburetted charge, introduced into the crank case every revolution, lies not only inside and around the main piston, but also inside the piston valve, and as there is only a thin wall of metal separating the hot explosion from the newly introduced cool charge, the excessive heat from the former is absorbed by the charge, which is afterwards passed into the cylinder, thus cooling the piston valve and preventing dissipation of heat from the outside. This helps the petrol consumption and aids in an easy start.

The top rings of the main piston maintain their elasticity under severe loads and constant running far better than is found to be the case in the usual four-stroke engine. This is due to the fact that the piston in the two-stroke engine is cooled internally every revolution, whereas in the four-stroke engine there is no fresh air introduced inside the crank case. The piston valve is operated by link motion from the gudgeon pin, with about half the

A scene in the paddock at Newmarket races. Sidecars were well in evidence; modern outfits were parked side by side with the oldest possible.

stroke of the main piston, but there are several ways in which the piston valve can be reciprocated.

The lubrication of the piston valve does not appear to give any trouble. In the first experimental engine the petrol system was adopted, and gave excellent results. Probably, however, an oil mist is the best system of lubricating the piston and piston valve.

The author is of the opinion that a single-cylinder two-stroke air-cooled engine designed on the lines laid down is the type for lightweight motor cycles, whilst a similarly designed two-cylinder vertical two-stroke engine is the ideal for sidecars.

Among those who challenged some of the author's remarks were: Messrs. Butterfield, J. Duffy, G. Funck, and D. S. Heather. Mr. Duffy thought Mr. Tilston's references to the three-port type of engine were exaggerated, and said that carburetters were more to blame for lack of economy than the principle of the engine. A carburetter for two-strokes was badly needed, and after experiments with one of the wick type he appeared to be of the opinion that possibilities lay in this direction.

Mr. Funck pointed out that the three-

port two-stroke has decided advantages, among which he mentioned its simplicity, reliability, and cheapness, while another speaker quoted 37% as the amount of mixture lost through the exhaust port. It was also stated that the very simplicity of the type was hindering progress. Mr. Heather mentioned 50 lb. as the mean effective pressure of the average two-stroke, and also that the length of the power stroke was not the length of the piston travel owing to the opening of the exhaust port. This speaker did not think that it was possible to make a really satisfactory type of carburetter for the three-port two-stroke.

No Answer to Critics.

In replying, Mr. Tilston referred to the success of the two Levis machines in the recent Victory Cup Trial, and congratulated the makers and riders upon the very fine performance. He, however, refrained from answering his critics, and promised to do so at a future date.

It appears that since the Tilston engine was demonstrated to the press some time ago other and improved models have been made, and are undergoing tests by important manufacturers.

HILL-CLIMBING IN THE PEAK DISTRICT.

WITH a gradient in one part of 1 in 2½, and numerous hairpin bends, Jenkins Chapel in the Peak District was often the venue for hill-climbing parties before the war, and one of the first events of the Oldham and District M.C. after its revival was a revisit to demonstrate the skill of its members in scaling the hill.

This event took place last week, and, owing to the heavy fall of rain the evening before, speculation was rife as to the possibility of any rider surmounting the summit. The hill is 283 yards long, averaging about 1 in 4. The first stretch is reputed to be 1 in 3½, the second 1 in

2½, third 1 in 4, and, finally, a stretch of 1 in 4½, and there are four sharp bends.

E. Bottomley, a daring young solo rider of a Harley-Davidson, was the first to assail the hill, and the manner and speed at which he made the ascent evoked astonishment. J. Davenport, on a 4 Triumph three-speed followed at a more steady speed and succeeded in reaching the top without touching the ground with his feet. These two riders caused some amusement and excitement by descending to the base, which was quite a difficult undertaking.

H. Bottoms (6 Bradbury) next attempted to climb the hill with two passengers,

but only succeeded in reaching the summit without them. J. Bottom (4 Triumph) was the first rider to scale the hill with a passenger, while another sporting sidecarist, with a single geared machine, disconnected his sidecar and successfully climbed the hill.

Many others attempted the climb, but few succeeded, and the honours of the day were shared by the Triumphs and the Harley-Davidson.

Bottomley and Davenport succeeded in making clean ascents five times in succession, and any northern rider who knows this hill will appreciate that they were very fine performances.

**Glasgow M.C.C.**

Arrangements are well forward for the hill-climb on the 24th inst. The hill will not be made known until the day of the event.

Hull A.C. and L.C.C.

The first competition of the year was run on Saturday last. The circular course included Hull, Hershle, Ferriby, S. Carr, Market Weighton, Beverley, and back to Hull.

Grimsby and District M.C. and L.C.C.

Grimsby and district motor cyclists interested in club life should communicate with the secretary of the local club, Mr. M. Jennison, 114, Victoria Street, Grimsby.

Hamilton and District M.C.C.

It is proposed to hold a general meeting of the above club to-night (the 15th) at the Commercial Hotel, Hamilton, at eight o'clock. All motor cyclists in the district are invited to attend. Hon. sec., Mr. J. F. Bowness, Reith Cottage, Hamilton Road, Motherwell.

N.M.C.F.U. (Wolverhampton).

The Wolverhampton branch of the N.M.C.F.U. are holding their first social run on the 18th inst., the trip being to Wellington, Salop, where tea will be taken. It is hoped that every member of the branch will make a special effort to attend.

Redditch and District M.C.C.

Energetic measures are being taken to make this club a success, and interested motor cyclists in the Redditch district, of which there are quite a large number, should communicate with the hon. secretary, Mr. F. G. Jenkins, Cuenca, Ease-more Road, Redditch.

Northamptonshire M.C.C.

The above club has been re-organised and restarts with substantial funds in hand, in addition to which the club has three valuable silver cups for competition. Northampton motor cyclists wishing to join the club should communicate with Mr. J. B. Sneath, 3, York Road, Northampton.

Liverpool M.C.

Twenty members took part in the social run to Llandudno, eleven of whom took part in the speed-judging competition. The following are the result:

1. — Chapman (3½ Zenith), 17 m.p.h., 19s. error.
2. N. H. Brown (7-9 Indian), 20 m.p.h., 47s. error.
3. T. Lane (6 A.J.S.), 18½ m.p.h., 54s. error.
4. W. Pohjoy (6 A.J.S.), 16 m.p.h., 58s. error.
5. — Cottle (2½ Calthorpe), 18 m.p.h., 58s. error.
6. — Zacharias (6 Sunbeam), 19½ m.p.h., 68s. error.
7. — Honeyman (4 A.J.S.), 16 m.p.h., 69s. error.
8. — Wilkins (3½ Sunbeam), 17 m.p.h., 1m. 54s. error.
9. — Pollard (2½ Douglas), 19 m.p.h., 3m. 33s. error.
10. — Bell (3½ Rudge Multi), 17½ m.p.h., 4m. 31s. error.

Future Events.

- May 15.—Hamilton and District M.C. General Meeting Commercial Hotel, Hamilton, at 8 p.m.
- May 15.—Tredegar and District M.C. Hill-climb at Fiddler's Elbow.
- May 17-18.—Birmingham M.C.C. Week-end Touring Competition to Llangollen.
- May 17.—Liverpool M.C. Social Run to Llangollen.
- May 17.—Luton and Beds. A.C.—Opening Run.
- May 17.—N.M.C.F.U., Leeds. Invitation Run to Keadby.
- May 17.—N.M.C.F.U., Sheffield. Run to Hatfield.
- May 17.—S. Birmingham M.C.C. Run to Stratford.
- May 17.—Sutton Coldfield A.C. Half-day Trial for Levis Cup.
- May 17.—Woolwich, Plumstead, and District M.C.C. Open Trial for Matchless Cup.
- May 17.—York and District M.C. Paper-chase.
- May 18.—Carlyle C. and M.C. (Chelsea). Run to Dorking.
- May 18.—Eastern Counties M.C. Run to Bedford.
- May 18.—Ilkeston and District M.C.C. Run to Surfleet.
- May 18.—N.M.C.F.U., Birmingham. Run to Yarnington Common.
- May 18.—N.M.C.F.U., Sheffield. Run to Longnor.
- May 18.—Wolverhampton N.M.C.F.U. Social Run to Wellington, Salop.
- May 18.—Woolwich, Plumstead, and District M.C.C. Inter-team Trial.
- May 21.—York and District M.C. Reliability Trial.
- May 21.—Harrogate and District M.C.C. Social Run to Pateley Bridge.
- May 24.—Coventry and Warwickshire M.C. Manville Cup Trial.
- May 24.—Birmingham M.C.C. Social Run.
- May 24.—Glasgow M.C.C. Hill-climb.
- May 24.—Oldham and District M.C. Reliability Trial, Heyden Bridge.
- May 24.—Sheffield and Hallamshire M.C.C. Competition for Dickenson and Darwen Cup.
- May 25.—Eastern Counties M.C. Run to Newlands Corner.
- May 25.—Ilkeston and District M.C.C. Run to Quorn.
- May 25.—Liverpool M.C. Social Run to Blackpool.
- May 25.—North Derbyshire M.C.C. Run to Edwinstowe.
- May 25.—Rochester, Chatham, and District M.C. Run to Margate.
- May 25.—S. Birmingham M.C.C. Run to Bromyard.
- May 25.—N.M.C.F.U., Sheffield. Run to Glossop.
- May 31.—N.M.C.F.U., Sheffield. Run to Edwinstowe.
- May 31.—S. Birmingham M.C.C. Reliability Trial.

- June 1.—Harrogate and District M.C. Reliability Trial.
- June 6.—Essex Motor Club. Midnight Ride to Yarmouth.
- June 6-7.—M.C.C. London-Edinburgh Run.
- June 7-9.—Birmingham M.C.C. Trial to Land's End.
- June 9.—Cork and District M.C.C. Twenty Hour Reliability Trial.
- June 9.—Liverpool M.C. Open Reliability Trial.
- June 25.—Essex Motor Club. Speed Trials at Southend.
- August.—A.C.U. Six Days Reliability Trials.

The Proposed Colchester Club.

With reference to our paragraph regarding the formation of a club in Colchester, Mr. Edmond T. Elliott, who was an enthusiastic clubman before the war, writes that he will be pleased to act as trials secretary if such a club is formed. His address is c/o Egerton's, Northgate Street, Ipswich.

Purley and District M.C.C.

An effort is being made by Lt. C. A. H. Mason, 3, Queen's Road, Wallington, Surrey, who is undertaking this work in the absence of the hon. sec., who is still engaged on military duty, to start the Purley and District M.C.C. Lt. Mason will be pleased to hear from past members of this club and from those who would care to join.

South Birmingham M.C.C.

The next runs will be to Stratford and Bromyard on the 17th and 25th inst. respectively. The club reliability trial has been arranged for the 31st inst., entries for which should be sent to Mr. Roberts, 25, Cumberland Street, Broad Street, Birmingham. Hon. sec., Mr. E. Boydell, John Bright Street, Birmingham.

Rochester, Chatham, and District M.C.

An inter-meet with the Blackheath and District M.C.C. is being arranged in conjunction with the run to Margate on the 25th inst. or the run to Hawkhurst on June 1st. Particulars of the club holiday at Whitsuntide will shortly be announced. Badges are now obtainable for 4s. 6d. from the hon. secretary, Mr. S. White, 3, South Avenue, Rochester.

York and District M.C.

The results of the slow hill-climb at Garrowby are as follows:

SOLO.

1. Maj. G. Jefferson (4 Triumph).
2. P. Payne (3½ Ariel).
3. G. A. Walker (4 Triumph).

SIDECARS.

1. C. Potter.
2. W. E. Haddon (6 A.J.S.).

IMPROMPTU RACE.

1. C. R. Todd (8 Martin-Japi).
2. G. Hannen (8 Harley-Davidson).

THE M.C.C.'S SPEED-JUDGING CONTEST.

Successful Opening of the
Social Programme by a
Prominent Club.

THE first road event held by the Motor Cycling Club since the Armistice was a speed-judging trial, run over a course near Potters Bar on Saturday last.

The start took place about a mile from the junction of the Goff's Oak and Northaw Road to the Great North Road, and the route was a circular one about five miles in extent. Each circuit had to be covered three times, the first time at 16½ m.p.h., the second at 18½ m.p.h., and the third at any speed between 10 and 20 m.p.h. the competitor decided to declare. Altogether there were eighteen entrants, and of these nine rode motor bicycles and nine were down to compete as passenger motor vehicles, which included cars.

All the motor bicycle entrants started, but one driver of a sidecar outfit and two car drivers failed to put in an appearance. Among the competing machines we noticed a 3½ h.p. T.T. Rudge-Multi, a brand new 3½ h.p. Sunbeam beautifully finished and of most handsome appearance, one of the new Metro-Tylers, and a new flat twin Wooler. Of the officials present Mr. Robert Head, chairman of the M.C.C., acted as chief marshal, Mr. F. T. Bidlake was the timekeeper, and Mr. W. H. Wells did valuable work in taking him round the course so as to fix the arrows in position. Altogether it was an exceedingly pleasant afternoon—the rain held off, the roads were fairly good and not dusty, and the temperature was just right.

A start was made at about 3.15 p.m., and the leader of the competitors was A. C. Robbins on the new 2½ h.p. Wooler. We started soon after, endeavouring to keep to the prescribed speed. Speedometers and watches were allowed, but we carried neither, and our guessing proved to be somewhat wide of the mark. Two

Scene at the start of the M.C.C.'s speed-judging contest which took place last Saturday.

competitors passed us after the start, and the rest of the trip was made alone.

The route lay along the Ridgeway, with the Great Wood on the left looking perfect in its garb of fresh springtime verdure, straight along to Cuffley, passing the field where the first German airship (not a Zeppelin but a Schütte-Lanz) was brought down on English soil in

1916, leaving Cuffley station on the left, and straight on through pretty Northaw village, including a sharp rise, then round to the right and back to the start. The road surface was fair on the whole, but bumpy beyond Northaw. Southcomb May (hon. sec., M.C.C.) retired on the second lap, otherwise the event was without incident.

At the conclusion the competitors proceeded to the Old Salisbury Hotel, Barnet, where an excellent tea was served, and the results were announced as follow:

MOTOR BICYCLE CLASS.

1. M. L. Luigi (4¼ B.S.A.), error 57s.
2. W. C. Hemy (2½ Metro-Tyler two-stroke), error 1m. 20s.
3. V. Olsson (4 Douglas), error 1m. 21s.
4. S. C. Selby (3½ Rudge), error 1m. 55s.
5. A. C. Robbins (2¼ Wooler), error 2m. 2s.
6. J. E. Hull (2¼ Wooler two-stroke), error 2m. 5s.
7. R. H. May (4¼ B.S.A.), error 2m. 10s.
8. E. M. P. Boileau (3¼ Sunbeam), error 2m. 20s.

In the passenger class W. H. Wells's car made the best time of the day, as his error was only 47 sec. The best sidecar was J. A. Masters's 7 h.p. Harley-Davidson, which finished third, error 2 min. 7 sec.; E. Bridgman's 7 h.p. Indian sc. was fifth, error 3m. 14 sec.; while A. Mabon's 3½ h.p. Mabon sc., was sixth, error 3 min. 43 sec.

A competitor in the M.C.C. trial. E. Bridgman on his 7 h.p. Indian.

To Commemorate a Pioneer.

Birmingham Scheme to Perpetuate the Memory of James Watt.

BIRMINGHAM, the home of so many great enterprises in the engineering world at the present time, was the city where the great James Watt spent most of the working years of his life, and where he died in retirement at the age of 83. The centenary of Watt's death occurs in August next, and it is only fitting that Birmingham should desire to perpetuate his fame in a worthy and lasting manner. To this end a meeting was convened at the Council House, Birmingham, on the 8th inst., under the presidency of the Lord Mayor, to propose resolutions that the centenary should be marked in the following manner:

(1.) To endow a Professorship of Engineering, to be known as the James Watt Chair, at the Univer-

sity of Birmingham, for the promotion of research in the fundamental principles underlying the production of power, and the study of the conservation of the natural sources of energy.

(2.) To erect a James Watt Memorial Building, to serve as a museum for collecting together examples of the work of James Watt and his contemporaries, Boulton and Murdoch, illustrating this interesting epoch in the history of engineering. The building would also serve as a meeting place and library for scientific societies, and be a centre from which engineers can co-operate in spreading technical knowledge.

(3.) The publication of a memorial volume.

The meeting was attended by some 200 representatives of learned societies and engineering institutions. A most interesting speech was delivered by Sir Oliver Lodge, Principal of Birmingham University, on Watt's contribution to science. In the course of his speech Sir Oliver made the suggestion that the proposed chair would practically resolve itself into a chair of fuel research, and voiced the opinion that were James Watt alive today, in all probability his genius would be directed towards improving and perfecting internal combustion motors.

The Lord Mayor made the announcement that the Birmingham Small Arms Company, Ltd., had promised £1,000 towards the expenses of endowment of the Chair of Research, provided five other similar donations were received.

BALANCING THE SINGLE.

Device by Famous Engineer to obtain a Perfect Mathematical Balance.

IN a leader in the issue for April 3rd we referred to the question of balancing the single-cylinder engine; we are now able to give particulars of the device to which we referred and which probably foreshadows remarkable developments in single-cylinder engine design. The inventor of the device is Mr. H. R. Ricardo, the designer of several important war service engines, but who perhaps is better known to the general motoring public as the inventor of the Ricardo two-stroke engine and the slipper piston.

From the patent specification drawings reproduced it will be seen that, according to this invention, two masses are mounted so that they can reciprocate substantially radially with relation to the crankshaft, and are disposed in line with either side of the crankshaft and on that side opposite to the piston.

Two crank members are formed on the shaft, adjacent to the crank webs, and are introduced to reciprocate the two masses in opposite phase to the working piston. In the diagram, these crank members are formed as a pair of eccentrics, the throw of which is opposite to that of the main crank. To these eccentrics are connected a pair of weights, which are constrained by links so as to reciprocate substantially radially with relation to the crankshaft. The ratio of the throw of each eccentric to the distance between the centre and the centre of gravity of the weights to which it is connected is equal to the ratio of the throw of the main crank to the length of the connecting rod.

Further, the ratio between the weight of the masses that are reciprocating (i.e., the piston and connecting rod on the one side of the crankshaft and the counter-weights on the other side) must be inversely propor-

tional to the strokes through which these masses reciprocate. To control the reciprocating movement of the weights, two rocking arms are employed, which are pivotally connected at one end to the weight at the point near the centre of gravity of the weight. At their other end the rocking arms are pivoted to some fixed point at one side of the crank case.

The illustrations depict in diagrammatic form a single-cylinder engine arranged with the balancing device. Incidentally, it may be mentioned that the

utility of this device is not confined to single-cylinder engines.

A careful study of the illustrations will show that by making the rocking link of sufficient length and the throw of the eccentric relatively short, the arc through which the weights are reciprocated can be approximated to a straight line. Other forms of linkage may be employed which will enable the weights to be reciprocated substantially radially with respect to the crankshaft axis.

Where the centre of gravity of the main reciprocating mass (the piston and connecting rod) is not coincident with the gudgeon pin, but lies at

some point in the connecting rod, so that this centre of gravity describes an ellipse instead of a straight line, the centre of gravity of each counter-weight may be compelled to follow a similar and opposing elliptical path. This can be effected by connecting the rocking link to the weight at a point slightly below the centre of gravity of the weight. In this way the common centre of gravity of the two groups of reciprocating masses can be maintained coincident with the centre of the crankshaft under all circumstances, and a perfect mathematical balance can be obtained.

Ricardo's patent balancing device for single-cylinder engines.

WHAT WE STILL WANT.

ENOUGH information is available to suggest that few, if any, of the 1919 models will embody all the practical gadgets for which the average rider clamours. To quote examples, when I take delivery of a new mount, the following operations are essential:

(1.) Fit a speedometer. (No "integral" provision for the drive: and the fitting of this accessory is always a particularly fiddley job.)

(2.) Obtain and pack spares. (These will vary with the type of machine: chain and belt spares, plug, and valve representing the usual requisites. They are never provided with the machine, nor is any provision made for packing them.)

(3.) Obtain and pack tyre repair outfit. (Seldom

supplied. Frequently the outfit is too big for the pannier. The vendors of the repair outfit should dimension it to fit a standard pannier.)

(4.) Obtain and fit a tail lamp. (Provided only on electrically-equipped machines.) A tail lamp should be designed as an integral part of the machine, and supplied with it.

I say nothing as to equipment with head lamp, hooter, etc., on which tastes vary. In such matters the practice first introduced by the Rudge people (I fancy) of including a variety of suitable patterns in their catalogue, just about fills the bill: it enables the man who wants his machine complete on delivery to suit his own fads.

ROAD RIDER.

The New Douglas Suspension System.

Laminated Springs Abandoned in Favour of Helical Springs and Links.

It is now known by almost every spring frame inventor and maker that the proposition presents more difficulties than is supposed by motor cyclists generally. Therefore the following description of the details and principle of the Douglas new frame will be found of more than ordinary interest considering that the principle is entirely different from the other spring frame introduced by this firm.

In our issue for May 1st we gave a detailed description of the new $3\frac{1}{2}$ h.p. Douglas model, but space did not permit us to deal fully with the spring frame and the redesigned front forks. After two years' road experience with the new type of springing the makers are abandoning the laminated springing system of their pre-war models, and have the greatest confidence in coil springs as being more suitable for motor cycle frame suspension.

Side view of the front wheel suspension. Note the lamp bracket.

The back wheel is now carried in a triangulated frame, which is pivoted on the main frame at the rear of the gear box bracket. This pivoting point has a plain bearing 6in. wide. Hardened ground steel bushes provide the necessary bearing surfaces for the hardened distance pieces which surround a $\frac{1}{2}$ in. knock-out spindle. Hardened steel washers are pegged to the inside of the frame forks, movement occurring between the faces of these washers and the flanged ends of the bushes. Means of adjustment are not

General view of the springing system. The carrier tubes are omitted.

needed, as wear, if it occurs, will be very slight, and can be remedied by new washers.

At the apex of the triangle the rear frame is connected to the springs through a pair of levers which largely follow front fork practice. The upper ends of these levers are connected to a compensating link, which, in turn, is coupled to the main frame. The levers are attached to a pair of enclosed helical springs which lie horizontally one on each side of the frame with a forward attachment on the lower tank tube. Each spring is made up of

Section through the lower links of the front forks. Note the grease cups and means of adjustments.

two concentric springs of different periodicity. The action is obvious, but the amount of reduction through the links and levers is not so easily appreciated. A vertical movement of 3in. on the driving wheel is reduced to about $\frac{1}{4}$ in. on the springing. Lateral movement is practically non-existent.

The carrier is sprung with the frame, the lower lugs at the rear of the tank tubes accommodate a long supporting bolt, which carries both the saddle springs and the horizontal carrier tubes. The sloping carrier tubes are fixed to the main frame on the lug, on which the rear frame is pivoted.

The principle of the new front fork is the same as in former Douglas models. The chief point aimed at in redesigning has been to avoid lateral movement, greater resistance to wear at the links, and a good form of adjustment and lubrication. If side play develops it can be taken up by removing the grease caps, and slackening off the outside locknuts a few turns; a key is then inserted in the square holes in the spindle ends, and the spindles turned counter clockwise until the links move freely without side play.

The links of the spring frame in section and the wide bearing upon which the frame is pivoted.

The method of holding the springs is very good. Instead of the usual method of a nut and washer grip on the end coils of the spring, hardened steel lugs are spirally grooved to take two or three of the spring coils, and are screwed in at each end of the spring.

The steering crown is formed with a substantial lamp bracket projecting forward through the spring fork tubes.

READERS' ROAD REPORTS.

THE following are a selection of road reports furnished this week by readers of *The Motor Cycle*.

WARWICKSHIRE AND STAFFORDSHIRE.

Chester Road Station to threequarters of a mile beyond New Oscott.—Road very bad; pot-holed all over.

LEICESTERSHIRE.

Many of the Leicestershire roads are bad, one of the worst being from Leicester to Loughborough.

CUMBERLAND.

The road from Air Force to Matterdale is good, but from Matterdale to Troutbeck it is hardly safe, as it has been badly cut up by heavy timber waggons.

The road from Newby Bridge to Kendal over Cartmel Fell is good.

The road over the Kirkstone Pass is in excellent condition, though the surface is a trifle loose in places.

DENBIGHSHIRE AND MERIONETHSHIRE.

Chirk to Llangollen.—Road very bad; rutty condition for about two miles.

Corwen to Cerrigy-Druidion.—Still in a bad condition (has been so for quite a long time). It has been made up, but badly.

Corwen to Bala (main road).—Very bad, with loose stones. Valley road good.

Bala to Frongoch over the Arenigs to Festiniog.—Road almost impassable; the ruts are ten inches deep in places.

Portmadoc through Penrhyndendraeth, Harlech, to Barmouth, up to Penmaenpool.—In fair condition.

CARNARVONSHIRE.

Lake Gwinant, nearly into Beddgelert.—Road very badly cut up from timber drawing.

Road from Portmadoc through Criccieth, Pwllheli, Llanbedrog, to Abersock.—Very good.

Road from Pwllheli to Nevin.—Good. Nevin through Four Crosses to Criccieth.—In very good condition.

MONTGOMERYSHIRE.

Road from Dolgelly to Dinas Mawddwy, Welshpool, and Shrewsbury.—In very good condition.

MONMOUTHSHIRE.

The road from Cardiff via Newport and Chepstow up the Wye Valley to Tintern is in excellent condition except for about one mile on the Cardiff side of Newport.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address

A SPORTING MACHINE.

Sir,—It will probably interest your readers to know that the Zenith I rode in the Birmingham trial, and which did a non-stop run, was a standard 1915 model with a low gear of only 7 to 1. This, I should think, was the highest gear in the trial, and, in my opinion, is far more sport to drive round a tricky course than a very low geared machine, as the engine speed must be kept up on a stiff gradient. Congratulations on your plan of description of this event.

I should like to recommend all readers who are keen on motor cycling as a sport to enter in open trials. It gives one an enjoyable and sporting day's outing, and you get plenty of fun even if you do not pull off an award.

R. CHARLESWORTH, Lt., A.D.S.

SCOTTISH FERRIES.

Sir,—The Granton to Burntisland Ferry has been disused for a few years. It was advertised to start on May 1st. I wanted to cross only recently, but could not. All the satisfaction I could get was the statement that it would start in June. There are no regulations regarding petrol.

To cross the Forth it is necessary to go to Queensferry. Petrol may be carried. Solo mount, 6d.; yourself, 6d. The road from Inverkeithing is very bad as far as Kirkcaldy.

JAMES KILCOYNE.

Sir,—In reply to letter from "W 5124," I may state that I have crossed the River Forth on all the ferries both with motor car and motor cycle, and have always found absolutely no difficulty whatever.

There are no restrictions as to the carrying of petrol, and the charges are very moderate.

With regard to touring in the Highlands, I have not known of this ever having been stopped. It is necessary, however, for the tourist to apply for a passport to travel north of Inverness, this being a special military area. The chief constable at Inverness issues these passes.

Ferries north of Inverness are very rough and ready affairs, and there is considerable difficulty in loading and unloading.

A. SCOTT FREEMAN.

DUAL PURPOSE MOTOR CYCLES.

Sir,—Because a writer favours one special make of machine I hardly think he is justified in insinuating, even in the form of a question, that all other makes fail to be ideal for solo or sidecar work.

As an amateur rider, with practically no technical knowledge like Mr. G. Taylor, I can only speak from results as I see them; and I say that there are many machines which serve the dual purpose exceedingly well. We all look for improvements and new ideas, and so welcome and give our best wishes to the A.B.C., but why despise our old tried and true friends, which have carried us thousands of miles alone, and when asked to carry a double load have never failed us? I am patiently (or otherwise) waiting for a 3½ h.p. Sunbeam which, with its oil bath, gear case, and lively engine, will, I know, take me either solo or with a sidecar over the worst hills and roads of North Devon with perfect ease, and there are many other makes which can do the same.

N. H. KETTLEWELL.

Sir,—I am rather disappointed in one respect with that excellent production of Mr. Granville Bradshaw, viz., the 400 c.c. post-war model of the A.B.C. motor cycle, rated at 3 h.p. and weighing 150 lb. I have been longing for these happy days of peace to come, so that I could order one of the A.B.C. models, secretly hoping that the 500 c.c. model rated at 3½ h.p. would be increased to 550 or 600 c.c., thereby giving us a 4-5 h.p. machine for "double purpose," instead of which I find the capacity reduced to 400 and the weight to 150 lb.

I want the machine chiefly for pillion riding with a combined weight of say 22 st., including luggage, and possibly for a sidecar when I can find accommodation for it.

Now I am afraid that this model will not be strong enough for serious touring under the conditions I have stated, and that the load would necessitate running the engine "all out" for a considerable period of a day's run. This is bound to result in rapid wear and deterioration. I do not mind the first cost, but I cannot afford to buy a machine every few years. The one I have must wear and last for years, provided time and money are spent on its upkeep, and it is not overworked.

Cannot the A.B.C. Motors, Ltd., be persuaded to give us something between their 1,100 c.c. cycle car and the 400 c.c. solo mount?

I am sure there must be hundreds like myself who want a double-purpose mount that will give that long service that I have stated to be essential.

I trust, therefore, that some steps will be taken to satisfy that demand or many of us will, very reluctantly, feel ourselves compelled to buy inferior mounts, but of higher h.p. Portsmouth.

A.H.P.

Start of the first heat in the solo class at the York and District Motor Club's hill climb at Garrowby Hill. Results will be found on page 495.

SADDLE TANKS.

Sir,—I am glad to see the increasing popularity of the saddle tank, and to note that Messrs. Alldays and Onions have adopted it as their standard pattern.

It is, of course, open to anyone who devises a new or original shape of saddle tank to register the design of that shape, and Messrs. Alldays and Onions appear to have registered such a design a few months ago. The saddle tank itself dates from pre-war days. You described mine in your issue of June 18th, 1914, in connection with the triangulated top frame.

This form of frame construction is the real *raison d'être* for the saddle tank, the latter being the natural concomitant of the former.

DOUGLAS LEECHMAN.

THE GYROSCOPIC ACTION OF FLYWHEELS.

Sir,—“Ixion’s” remark *re* the gyroscopic action of transverse flywheels in motor cycles seems to assume that this action should tend to make a turn more difficult. On the contrary, however, it has no effect with this type of flywheel, and it is the ordinary flywheel rotating in the plane of the motor cycle that makes cornering more difficult. This can be shown by a simple process of reasoning from the elementary laws of mechanics relating to rotary motion.

The trouble occurs in the “banking over,” which always takes place in cornering. In the case of the usual type of flywheel there is a resistance to this “banking,” and the machine must therefore bank over at a bigger angle than would otherwise be necessary. In the case of the transverse flywheel, there is no resistance whatever, the effect in this case being an increased pressure on the front or back wheel according to the direction of the turn.

Obviously, then, the A.B.C. motor cycle, for example, should be, as far as the flywheel effect is concerned, a better cornering machine than, say, the conventional single-cylinder.

F. OGLE.

[“Ixion’s” paragraph was written to correct the suggestion made by a correspondent that cornering would be difficult on an A.B.C.—Ed.]

AN ENTHUSIAST.

Sir,—Having been a reader of *The Motor Cycle* for three or more years, and observing that you occasionally give space to paragraphs written by obscure lovers of the sport, with snapshots, I venture to send herewith a small photograph in which my $3\frac{1}{2}$ h.p. James twin machine appears.

You may be interested to know that I have taken up motor cycling after attaining my 51st birthday, and I get a tremendous amount of pleasure out of my James when I go out equipped with a camera and a binocular, and, although this is a land of high hills and steep gradients, I have not yet found an ascent that my little James will not romp up without trouble.

Mr. John Owen, who speaks enthusiastically of the motor cycle, and of the James in particular.

I would like to add my congratulations to the many you receive on the excellence of your paper, both as regards the matter as well as the attractive “get up.” I look forward eagerly to each issue, and read the whole from cover to cover.

JOHN OWEN.

Abergavenny.

THE A.B.C. COMBINATION.

Sir,—In view of the fact that future proud owners of the A.B.C. who desire to run a sidecar will often ride solo when the best girl is not available, it would be interesting to know if machines ordered as combinations will have special lugs brazed to the frame, or if all machines will be the same. It will be a great boon—especially for those who cannot get a combination indoors as a whole—if the sidecar is easily fixed with little possibility of getting an incorrect position.

Perhaps Mr. Granville Bradshaw will oblige with details, as none have yet been published.

F.A.

Bournemouth.

OVERALLS.

Sir,—*Re* “Ixion’s” remarks *anent* overalls; why should overalls always be made so that they cannot be put on without smudging the mud of a dirty boot all over one’s nether garments? The instep straps also are fastened in the wrong way. The enclosed sketch shows how to avoid both these troubles, and overalls so made are fully as efficient in every way as the usual kind—I have worn them for years, having had them made to order, and can speak from experience.

MUD-PLUGGER.

A useful design of overalls.

AVERAGE SPEEDS.

Sir,—A letter published in your issue of April 24th from “R.D.B.” *re* average speeds has “given me furiously to think.”

As one who has travelled the road in question many dozens of times for the last seventeen years, I may claim to know it well.

To put up an average of 34 m.p.h. your correspondent must have travelled for miles on end at speeds of 50 m.p.h. and over. There are portions of this road where speed is impossible, as at Iford, Christchurch, Totton (two dangerous corners), Winchester, Itchen Abbas (two corners dangerous), and Farnborough with its military traffic. What arrangement did “R.D.B.” make with the railway companies to have all the level crossings open as he flew by?

All things considered, I am afraid that “R.D.B.” must be exaggerating somewhat. No wonder motor cycling “stinks” in the minds of too many of the non-motoring public.

SHAZBAZZIK.

Sir,—With regard to the letter of “R.N.” concerning average speeds, I might mention that on Tuesday last I rode from Dunstable to Rugby, a distance of forty-nine miles, in 1h. 15m., which works out at 39.2 m.p.h.

The machine was a 1919 I.O.M. Rudge Multi, and was driven well within its limits.

The same journey was done on another occasion with a passenger on the carrier at an average speed of 33.4 m.p.h.

No overheating or loss of power occurred on either run. Usual disclaimer.

A. BRESLAU.

Sir,—Is not this question a relative one, like most motoring questions, and needing various factors to be taken into account? Doubtless “R.N.’s” friend exaggerated in saying he did 140 miles in three hours, but there is a reasonable medium between that and “R.N.’s” dictum that 20 m.p.h. only can be fairly reckoned on. It is all a matter of whether one wants to or not, plus horse-power and engine in good trim.

I have just completed a run of 340 miles, there and back—Lincolnshire to Wiltshire. My outfit is a $4\frac{1}{2}$ h.p. B.S.A. combination. I left at 8.30 a.m. and arrived at 4 p.m., stopping once only to fill my tank. I carried my own petrol for the whole trip in addition to passenger and bag, and ate as I rode. The petrol was No. 3 grade. The speed never dropped below 25 m.p.h., was mostly 30 m.p.h., and often 35 m.p.h. so long as I had a clear road. I passed through four big towns and encountered some dangerous corners, which necessitated a slower speed, but the machine had no rest, since the gears were constantly in use. I repeated the performance returning.

If the engine is of $4\frac{1}{2}$ h.p. or more and in good trim, I see no reason why any rider accustomed to more than riding

A trial recently held by the Motor Cycle Club of Rome, which included a 1 in 16 hill, with very bad surface, was won by Trivellato, who is seen above mounted on a Harley-Davidson. His average speed was 45 m.p.h.

about town should not do the same, with no untoward strain on himself or engine.

In doing a trip of well over a hundred miles there is usually some other factor besides mere pleasure present, e.g., urgency, saving train fares (I saved over £5), etc. Consequently, one gets over the ground as quickly as possible, so that, should a breakdown occur, one has as much time as possible to rectify the trouble.

F.J.A.

Spilshy.

A TABLOID HISTORY OF AIR-COOLING.

Sir,—I was both amused and interested to read "Torque's" letter on this subject in *The Motor Cycle* for May 1st. I am not in the habit of rushing into print without obtaining authority for my facts. I have figures on petrol consumptions of aero engines at heights which "Torque" has never seen, so I am certain of my facts.

I presume that "Torque" is all the time referring to consumptions in the air and not on the bench, for he says that a rotary consumes about one-tenth of a pint more per b.h.p.-hour than a stationary of corresponding power. Pints per b.h.p.-hour is the bench method of giving consumptions; consumptions in the air are always gallons per hour.

I entirely disagree with the examples given by "Torque." They are hopelessly wrong. I will prove this, and show that the rotary is the more economical. The two following tables, which give consumptions in gallons per hour, are self-explanatory. I have chosen these particular engines because they are practically all the same horse-power as the two large rotaries given in table No. II. They are all taken at the same height (15,000 feet) and at full out speeds:

TABLE I. (STATIONARIES).

230 h.p. S.P.A. ...	11½	galls. per hour.
230 h.p. Puma ...	11¾	" "
200 h.p. Raf. 3a ...	13½	" "
220 h.p. Benz ...	13	" "

TABLE II. (ROTARIES).

230 h.p. B.R.2 ...	11	galls. per hour.
220 h.p. Clerget ...	10¾	" "

I regret that in my previous letter I was not a little more careful about horse-power. I should have explained what power of rotaries and stationaries I was thinking of. However, the above tables will do this. I still maintain that radials are "unproved." I am quite aware what the R.A.F. 1919 programme was (I probably knew it before "Torque" did), but laying down a programme does not prove an engine. This can only be done by plenty of hard work in Service

machines, and this has never been done with radials, so how can "Torque" imagine they have been proved?

I hope this letter will answer the various points raised by "Revs." in his letter of the same issue.

PITOT.

EASY STARTING.

Sir,—As a constant reader of your excellent paper, I see frequent articles and allusions to the difficulty of starting up under the present-day conditions of petrol, etc., and should like to give you my experiences. In the first place, may I say that I am badly crippled in the right leg.

I am riding a 1916 A.J.S. combination, which I find suits me admirably, and which gives me the minimum of trouble in every way, but particularly in this matter of easy starting.

Whether it be high summer or the depth of winter my machine will always start with, at the most, three kicks, by the simple operation of flooding the carburetter, and I have never yet had to prime the cylinders, though I have used all grades of petrol and benzole.

During a recent frost, despite the fact that my machine had been standing idle for some days in an unheated garage, I was agreeably surprised to find that the engine started away merrily at the second attempt, while on one occasion after standing uncovered in the snow for about six hours it started at the first kick.

I leave other A.J.S. riders to account for my apparent good fortune in this respect; but my system throughout has been to ensure a minute adjustment of my valves, to keep my plugs clean, and to pay constant attention to what is, I suppose, the fitment which gets the least attention on a motor cycle—the high-tension wire.

Finally, attention to lubrication and the use of good oil will save "gumming" and much bad language from those who find that it takes more time and energy than they can spare to start their machines and get on the road.

Wimbledon.

K.O.S.B.

VALVE OPERATION.

Sir,—As you are doubtless aware, certain aero engines, for example the Curtiss, have both overhead valves operated by one rod and one cam. I should be interested to know if any readers of your excellent paper have suggestions as to why this method should not be incorporated in the manufacture of motor cycles.

Overhead inlet and exhaust valves operated by one rod and cam.

I cannot recollect any such design of British or foreign manufacture, and should by chance motor cycle engines of this type be in use, and have not come to my notice, they are certainly few.

Personally, I think that such a design would result in the removal of valve clatter and tend towards simplicity in valve design, though, of course, it would not permit of overlap.

R. G. R. PRITCHARD.

MAPS FOR MOTOR CYCLISTS

"THE MOTOR CYCLE" ROAD MAPS.	Price.	Post free.
1. England & Wales. 2. Scotland. 3. London. (Showing roads into and out of London and avoiding London.) Set of three, complete in case ..	4/6	4/10

 or of leading Booksellers and Railway Bookstalls.

SAFE TRAVEL BY AIR.

Landing under Difficulties. Anchored "Buoy" Balloons. Parachutes as Life Preservers.

By TORQUE.

EXPERIENCED pilots whose air impressions are based on scout machines, and tainted by the special dangers of fighting and stunting, are apt to be pessimistic about commercial flight. They often say that regular aerial services, irrespective of weather conditions, are impracticable on any real basis of safety; and they regard the glib optimism of the daily press as sheer "hot air."

In sober fact, while there is much *premature* optimism abroad, present hopes merely need post-dating to, say, 1925, rather than contradiction. Take parachutes as an instance. We have scarcely used them except from balloons, but they are being developed at a great pace. Large aeroplane liners will soon be equipped with a parachute for each passenger. Before long a test demonstration will be organised. Twenty passengers will be taken up to 1,000 feet, don their parachutes, and quit the saloon through a door in the side. The mere sight of the tackle will naturally "put the wind up" the occupants at first: but before long they will rouse no more qualms than the sight of the lifebelts on a steamer. Modern patterns open with infallibility, and can safely be used from heights of 500 feet or less.

Improved instruments will facilitate navigation extraordinarily. In 1914 altimeters were useless as aids to night landing. The instruments then in use suffered from "lag," recording the machine's height after an interval during which it might have gained or lost many feet. The modern types register instantaneously and with great accuracy. With the aid of a few more gadgets, it will become possible for a third-rate pilot to make a perfectly safe night landing on an unlit aerodrome in a thick fog. I cannot give full details, but here is an outline of a crude scheme. The aerodrome is located by balloons carrying lamp signals and floating above fog level. The pilot glides down into the rectangle thus indicated. At a height of 200 feet, as registered on his altimeter, he lowers a trailing ground indicator, which need not be more complex than a weight slung on a cord, though this is not the actual method in view. When the weight touches the turf, the change in the pull on the cord is signalled to the pilot by suitable mechanism to which the cockpit end of the cord is attached. He now knows his height above the ground to a foot, and can land safely without wingtip flares or ground lights, or if such illuminations are blanketed by an impenetrable fog. To go a step further, such an

apparatus could be constructed to operate the controls at the correct moment and to the correct degree.

The Remaining Risks.

Route-finding will soon be organised by means of lighthouses, anchored balloons, and other ground signals. Before very long overwater routes will be similarly marked out, and the three chief surviving dangers of aerial travel will be limited to:

1. Forced "landings" on large expanses of water.
2. Fires in the air.
3. Collapse of the aeroplane in flight.

None of these is as formidable as it may often appear, both to the war pilot and to the man in the street. Such machines as the "Felixstowe Fury" will be used for trans-ocean flights. It has five engines, and can take off or hold the air with two engines out of action. Moreover, on her keel she can ride out quite choppy seas. So before a "ditching"

could have catastrophic results she would have to come down in really rough weather far from assistance and with three engines more or less permanently dud.

Fires in the air must remain a possibility as long as petrol is used for aircraft fuel. On the other hand, except under war conditions, a fire in the air is not

commoner than a fire at sea; it would usually be detected in its infancy, and extinguished immediately by chemicals. This peril is absolutely as negligible as in any other form of transit, apart from the special risk attending a crash landing; and crash landings, as suggested above, will be reduced or eliminated by other methods.

Structural collapses have not been uncommon in the war, but have generally resulted from enemy action—e.g., machine gun or Archie fire, or from exceptional strains in stunt flying. The design of machines has been safeguarded with great efficiency by the Air Ministry, and the quality of materials and workmanship has been verified by the A.I.D. Proposals now before Parliament are evidently framed to continue these precautions. With the removal of special war strains and dangers structural collapses should become extremely rare.

GRANTS FOR ROAD REPAIR.

In reply to a question by Mr. Joynson-Hicks in the House of Commons, the Secretary to the Treasury stated that the Road Board are dealing promptly with all applications for grants from highway authorities in whose districts unemployment exists.

In view of the frequent discussions on the air-cooling of fairly large-sized cylinders, it may interest those readers not conversant with aero engines to know that the Gnat, a flat twin aero engine following motor cycle practice (although 30 h.p.), was quite a success during the war, although used without any special system of cowlings.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Roc Two-speed Gear.

? Would you please be so kind as to give me the name of the makers of the Roc two-speed gear, as I had a small break-down recently and broke the clutch?—W.T.

The address you require is Messrs. A. W. Wall, Ltd., Hay Mills, Birmingham.

Which is the Faster?

? Would you kindly tell me which has made the greatest speed, a motor cycle or a motor car?—H.A.C.

Up to the present, a motor car holds the record for speed. The fastest motor car, officially timed, was Hemery's Benz, which accomplished 127.877 m.p.h. on November 8th, 1909, at Brooklands. The fastest motor cycle, officially timed, was Sidney George's Indian, which accomplished 93.48 m.p.h. on May 5th, 1914, at Brooklands.

28in. x 2in. Tyres.

? I have a very old Quadrant motor cycle, and I require a new outer cover for one wheel. The one I have on it now is 28in. x 2in. Can you tell me if I can put a 28in. x 2½in. on it, as I am unable to obtain a 28in. x 2in.? If not, can you tell me where I can get a 28in. x 2in. outer cover?—R.M.

A 28in. x 2in. rim will not take a 28in. x 2½in. tyre. If you cannot obtain a 28in. x 2in. cover locally, write to Messrs. The Dunlop Rubber Co., Ltd., Aston Cross, Birmingham, as to whether they have any 28in. x 2in. covers in stock.

Worn Dog Clutches.

? I have a 2½ h.p. Douglas. When riding on top gear the gear suddenly fails to hold and the engine races round as if in neutral. After a few moments it picks up again only to do the same thing a short time later. I have made all adjustments I can think of without effect. I should be very much obliged if you could help me.—C.H.D.

The trouble is due to worn dog clutches in the gear box or to the gear control lever being wrongly adjusted. See that the gear is perfectly free in the neutral position, and then ascertain whether the top gear is fully engaged. If this happens there should be no reason why the gear should not keep in engagement, but if, on the other hand, you find that after this adjustment the trouble still ensues, you should take down the gear box and see if the dogs are badly worn. If they are, renewals are necessary.

Sparking at the Contact Breaker.

? Would a magneto be faulty if (1) it sparked slightly at the platinum points? (2.) The make and break on my magneto is faulty. The points are opened the proper distance, but they close about two-thirds on the cam. Would this cause it to spark at the platinum points? I get a good spark at the plug. (3.) Is a sparking plug faulty when it loses compression through the body, except as regards loss of power through losing a little compression? (4.) Can anyone tell if a magneto is faulty by the colour of the spark? (5.) Is it possible for a magneto to fire petrol when poured in through the compression tap and not fire what is drawn from carburetter? (6.) What are the symptoms of a magneto getting out of order, besides the spark becoming feeble? (7.) What is the cause of firing in the silencer about once in a hundred or two when travelling "all out"?—P.W.

(1.) No, this is only natural. (2.) There must always be a slight sparking at the platinum point, but the degree of sparking is regulated by the condition of the condenser. (3.) Certainly the sparking plug is faulty if it allows the compression to leak past the body of the plug. (4.) You only need be concerned with the magneto being faulty if it ceases to spark. The colour of the spark is nearly always the same. (5.) Certainly this is possible if there is any defect in the carburetter. (6.) There are no others. (7.) Probably through misfiring, which causes unexploded charges to enter the silencer and get fired by the next charge which is exploded.

SPECIAL NOTICE.

TO EVERY READER.

TO ensure regular supply of "The Motor Cycle," readers are requested to place definite orders with their newsagents or at a railway bookstall for copies to be reserved or delivered each week. To depend upon chance purchase is to risk disappointment.

Castor Oil.

? Having a quantity of castor oil at my disposal, would you tell me if it would be suitable for the lubrication of my 3½ h.p. sidecar combination? I have been told it is used in air-cooled aero engines.—H.C.

Castor oil is not suitable for motor cycle engines, as it is liable to have a corrosive action upon the cylinder. Aero engines are run under different conditions, and are frequently cleaned, whereas motor cycle engines are required to run anything from 1,500 to 2,000 miles without having attention paid to them. We presume you do not refer to Castrol, which is quite suitable for motor cycle engines.

High Petrol Consumption.

? (1.) I have recently purchased a 2½ h.p. Alldays two-stroke motor cycle fitted with a Senspray carburetter. It is a good machine in every respect, but I find I can only get 48 to 50 m.p.g. This seems to me a very low mileage. I should be glad if you could advise me how to improve matters? It has the petrol method of oiling, and a No. 26 jet is fitted. (2.) What is the correct amount of oil to a gallon of petrol? There is a ½ pint measure fitted to the underside of the tank.—A.E.M.

(1.) We would recommend you to try a smaller jet, as the petrol consumption named is certainly too high if the machine is used at normal speeds. If, however, you are maintaining comparatively high averages, this may account for the consumption mentioned. (2.) The correct proportion is half a pint of oil to one gallon of petrol.

Carburetter Freezing.

? My 2½ twin is fitted with an Amac carburetter. The wire gauze fitted over the air intake becomes covered with a white film, like thin tissue paper. This cuts off the supply of air and stops the engine until the film is removed, when it goes all right again until the film reforms. I have varied the size of the jet, but with no success. Can you suggest cause and remedy and tell me if the fact of running on benzole is in any way responsible?—REX.

The thin film referred to is probably hoar frost or snow, caused by the rapid vaporisation of the fuel which causes intense cold. The only remedy is to remove the gauze and fit a warm air intake. Petrol would cause the same trouble as benzole. Try the effect of running without the gauze first of all.

Four-stroking.

[?] I have a 1914 2½ h.p. two-stroke Connaught and find it satisfactory except that, when running on the level or downhill, misfiring takes place, and it four-strokes frequently, but when going uphill it fires beautifully and pulls well. I shall be greatly obliged if you will give me an idea of the cause of the trouble.—K.L.S.

This is a common fault among two-strokes when running "light." Perhaps the fitting of a smaller jet might improve matters.

Miles per Gallon.

[?] I have a 4 h.p. W.D. Douglas sidecar combination, and shall be glad if you can tell me: (1.) What mileage should I get per gallon? (2.) How should the driving chain to the gear box be tightened? (3.) How is it that my aero plugs soot up every ten to fifteen miles, especially the rear cylinder one?—W.P.

(1.) About sixty miles per gallon. (2.) By loosening the nuts holding the gear box to the bracket and sliding it back. (3.) This is because you probably give rather too much lubricating oil.

Copper Tubing and Acetylene Gas.

[?] Will you please let me know if it is dangerous to use copper tube for connecting up acetylene lamps?—F.J.W.

There is certainly some danger in using copper tubing in connection with acetylene lamps, though nearly everybody does so. There is no doubt that steel tubing is safer. Under certain conditions—that is to say, if the temperature is warm and damp—a substance is formed of the nature of fulminate of mercury, known as copper acetylide, which is liable to explosion if the tube be subjected to a blow or to friction.

Timing a Two-stroke.

[?] My machine is a 1915 Levis two-stroke. I have taken it down for decarbonisation, but on putting it together it will not run. I have thoroughly overhauled every part—engine, carburetter, and magneto—but can find no defect. Timed contact points just breaking with piston on top and spark fully retarded. Is this correct? Carburetter quite clean, also jet; no air leak anywhere. Petrol gets into cylinder all right. Compression excellent—sufficient to lock back wheel. All ports—inlet, exhaust, and transfer—quite clear. I have tried several plugs, and every one has given a good hot spark when the plug has been out on the cylinder top. I have injected petrol into the cylinder, but get no explosion from that; therefore I conclude it must short-circuit under compression, although the carbon brush is quite clean on the slip-ring, also the platinum points.—B.C.O.

If the carburetter is really fixed properly without any air leaks at the joints, and the timing is correct, the engine should, of course, fire. The timing of a two-stroke requires a much more exact

setting than does that of a four-stroke. You might try the spark rather more retarded. If you half advanced the lever and retimed as before, you would probably get better results. We presume you have not replaced the piston back to front?

Cork Floats and Benzole.

[?] (1.) Would benzole injure the cork float of the fuel level indicator in my tank, also the enamel on the tank and the machine? (2.)

I recently had the springs of my Triumph forks plated and they now seem much livelier than before, bottoming very often on what I do not consider a very bad road. Could the plating have weakened the springs? (3.) Would Terry's spring links be a good remedy? (4.) Could you suggest a better alternative, or how they might be fitted? (5.) What gauge tubing is usually used for making the chassis of sidecars?—E.S.

(1.) Yes, unless the float is treated with a varnish made of 90% alcohol and shellac. Pure benzole does not much affect the enamel of the tank, but, as a precaution, it is advisable to wipe off any trace of benzole which has been spilt on the tank with an oily rag. (2.) The fact of plating the springs could not well have weakened them. (3.) Terry spring links could not be fitted to a Triumph fork. As you mention springs, we assume that the fork is of an old pattern or one not of the Triumph design; the modern Triumph fork has but one spring. (4.) A better alternative would, we think, be to return the springs to the Triumph Co. and ask them to exchange them for a stronger pair. (5.) The gauge varies from eight to twelve.

Fitting a Sidecar.

[?] Would you please give me advice on the following: (1.) I have a 1914 3½ h.p. Sunbeam and Gloria A1 1914 sidecar. Would you let me know what you consider the best means of connecting the bicycle to the car? When new, the back connection was by means of a bent tube from the saddle pin to the sidecar chassis just near the sidecar wheel. By having this kind of connection, it was impossible to keep the sidecar wheel in a vertical plane, and to get over this difficulty a straight tube was fitted from the saddle pin to a point about directly beneath the centre of the body of the sidecar; this connection broke the sidecar tube within the first fifty miles. Now I have the chassis repaired. I thought I would seek your advice before attaching it to the machine. (2.) I intend fitting four coil springs between the body and cross pieces of the sidecar, and should be glad if you could tell me what size springs to use (weight of passenger 11½ stone), as the sidecar wheel is not sprung. I thought these coil springs would take off some of the worst road shocks. Do you think ½ in. round stock, 2½ in. long, 1½ in. diameter, would be sufficiently strong for the purpose?—E.D.

(1.) You require a substantial connection on to the horizontal rear wheel fork, one to the saddle-pillar, and one to the

steering head. The point to aim at is to get a connection from near the sidecar wheel axle to the saddle-pillar in a straight line. (2.) You require four 75 lb. springs, about 3½ in. long, to give approximately ½ in. deflection.

Impure Benzole.

[?] I have a 2½ h.p. 1913 Douglas fitted with an A.M.A.C. carburetter, with which I am having some trouble. I should be much obliged if you would give me a few hints. I am running on benzole, there has been no alteration to the carburetter, and I have a jet which is about three sizes bigger than is generally used. When I start up, the machine will sometimes run all right on the throttle, but will not take any air; at other times it will only run about fifty yards and then start blowing back through the carburetter, and stop as soon as I try to open the air lever. I have had the carburetter all to pieces and cannot find anything wrong with it. The induction pipe joints are bound with tape, so there are no air leaks. I have new cylinders, so it cannot be the valve guides, and the valves are not sticking. I get a good spark and the timing is correct. I notice the slides in the carburetter are worn slightly, but have never had any trouble with petrol.—J.H.

You can usually afford to use a much smaller jet when you are running on benzole. Very likely the benzole you are using is impure, and the presence of water in it might account for the blowing back from which you are suffering. Find out the source from which the benzole was obtained, and, if you have reason to suspect its quality, write to the National Benzole Association, Horseferry Road, London, S.W.1.

RECOMMENDED ROUTES.**LEICESTER TO DROITWICH.—F.H.S.**

Leicester, Rugby, Southam, Learnington, Warwick, Stratford-on-Avon, Alcester, Bradley Green, Droitwich. Approximately 76 miles.

ALCESTER TO LIVERPOOL.—J.T.E.S.

Alcester, Droitwich, Kidderminster, Bridgnorth, Wellington, Hodnet, Whitchurch, Chester, Birkenhead, ferry to Liverpool. Approximate distance, 112 miles.

WOLVERHAMPTON TO HERTFORD, AVOIDING LARGE TOWNS.—H.G.C.

Wolverhampton, Willenhall, Walsall, Aldridge, Bassetts Pole, Watling Street, then direct to Fazeley, Atherstone, High Cross, Kilsby, Daventry, Weedon, Towcester, Stony Stratford, Penny Stratford, Dunstable, St. Albans, Hatfield, Hertford.

PRESTON TO LOWESTOFT.—H.P.

Preston, Clitheroe, Skipton, Ilkley, Otley, Harewood, two miles south of the latter place turn right and go through Doncaster, Retford, Newark, Sleaford, Swineshead, Holbeach, Long Sutton, King's Lynn, Swaffham, Watton, Caston, Attleborough, New Buckenham, Pulham, Harleston, Bungay, Beccles, Lowestoft. Approximately 260 miles.

WE KNOW

THAT by merely promising deliveries of new machines we could keep a clerk all day and every day booking orders.

THAT we could take any number of deposits and see our Bank Balance (like the fat boy in *Pickwick Papers*) "swell visibly."

THAT by buying second-hand machines indiscriminately at fancy prices we could, without any trouble, re-sell at still higher prices.

THAT we could easily obtain premiums for preferential deliveries of new machines.

THAT in fact at the present time:—

*There is unlimited capital (by way of deposits) for the asking.
Unlimited opportunities for making big profits.*

BUT as we have no intention of sacrificing our reputation—acquired by ten years' honourable trading—for one year's orgy of Boom Profits:—

We make no definite promises as regards delivery of new machines.

We persist in our rule only to sell second-hand machines as and when they pass through our workshops—where they are completely dismantled and thoroughly overhauled.

We continue our policy to supply new machines in strict rotation at catalogue prices.

AND——we are sanguine enough to think that in 1929 GODFREY'S LTD. will still flourish and be more firmly established than ever in the confidence of the motor cycling public.

WE can foresee a lot of trouble in the near future and a plethora of disillusioned and dissatisfied customers. We do not want a single one to associate GODFREY'S with his disappointment.

WE want GODFREY'S promise to be something which the whole motoring world will accept without question simply because it is GODFREY'S.

WE don't want to refuse orders. We are anxious enough to make our already large business larger still, but we want no business which is not satisfactory to the customer, and think it only fair to state we can only accept orders at present for strictly rotational delivery.

GODFREY'S LTD., 208, Gt. Portland St.,
LONDON, W.1.

Phone: 7091 Mayfair (2 lines).

We are open to purchase for cash modern second-hand motor cycles and combinations.
Send full particulars and our representative will call at your convenience.

THE A.A. AND THE MOTOR CYCLIST.

The wise motor cyclist is a member of the A.A. because he knows that not only does it offer him advantages not approached by any other organisation, but its activities precede him into every corner of the Kingdom and overflow on to the Continent.

Its General Headquarters are at Fannin House, Whitcomb Street, London, W. C. 2, where all its administrative departments are quartered. Here the Executive Committee under the Chairmanship of Mr. W. Joynson-Hicks, M.P., review and direct the work of the Association, and the chief officials under the Secretary, Major Stenson Cooke, meet weekly to discuss policies and programmes. The personal services of the staff are

at the service of every member and each inquirer receives prompt and painstaking attention.

In the Reception Room his particular business is stated, and if it can be settled then and there, that is done. If not, he is put in touch with the department handling it without delay or circumlocution.

Headquarters is the Clearing House for the considerable metropolitan membership, and linked up to it, modelled on its lines, and conducted with the same efficiency, are seven District Headquarters covering the entire Kingdom with offices at

Belfast.	Cork.	Manchester.
Birmingham.	Dublin.	Norwich.
Brighton.	Edinburgh.	Oxford.
Bristol.	Exeter.	Plymouth.
Cambridge.	Glasgow.	Swansea.
Cardiff.	Leeds.	and Paris and
Carlisle.	Liverpool.	Nice.

At each of these a member can obtain all the information and assistance available at General Headquarters.

The new member, or the old one re-starting, will have his way made easy in the matter of a petrol licence at any of these offices, and should he require it, obtain an insurance voucher covering the value of his machine and protecting himself to the fullest extent. He is handed his badge, hoists it, and has the most useful passport existing in Motoring.

Should he meet with mishap, he will find the A.A. road patrol a friend in need; should he desire information regarding route, road or railway, the patrol will provide it. He is

the motorists' guide, philosopher and friend,

and his local knowledge is all embracing.

In answering this advertisement it is desirable to mention "The Motor Cycle."

He can render first aid to man and machine, can advise where the nearest Doctor, Post Office, Railway Station, or Garage is located. He will bring fuel or human aid to the stranded motor cyclist, and his sentry box is equipped with a telephone which often is a perfect Godsend to the unfortunate or careless. If any article of equipment has been lost, he becomes an enquiry agent, and the missing unit usually turns up a few days later at the A.A. headquarters in the loser's district.

As he salutes, he notes the number of your machine for his daily report.

Should your motor cycle be stolen,

or taken out for a joy-ride, these reports provide evidence useful in tracing thief or joy-rider.

First aid motor cycle combinations are provided to assist members in case of accident or breakdown. These machines are equipped with tools and material to deal with mechanical repairs and tyre replacements, also stretchers and medical sundries for first aid to the member or his passenger. They work in conjunction with the roadside telephones and can be summoned by the patrols in charge of sentry boxes.

The A.A. has erected thousands of direction signs on a plan which tells the traveller not only the nearest Village or Hamlet on his route, but also indicates the terminal points. In addition, there are thousands of A.A. Special Warning Signs erected at dangerous points of all roads in the Kingdom.

The Road Scheme of the A.A. includes the appointment and classification of Hotels. This classification is being constantly revised in accordance with reports from members and inspecting officials. It also includes the appointment of Road Agents, Motor Cycle Agents and Garage Keepers, in order to provide members with **assistance of a satisfactory skilled character** and to prevent overcharging.

In connection with its insurance of machines, the A.A. member possesses a special privilege. Should any dispute arise between him and the Insurance Company, a special Committee of the A.A. adjudicate on the matter promptly and pay the award they decide upon. In the case of any overcharge by motor cycle repairer or road agent, the A.A. on appeal, takes the matter in hand and secures the most favourable settlement. Should a member be prosecuted for any offence under the Motor Car Act or D.O.R.A., free legal defence is provided by the A.A. and the case fought in any court in the Kingdom. This alone is worth more than the membership subscription.

Should a tour on the Continent be projected, now that the way to peace is clear, the A.A. will be found indispensable to comfort and freedom from trouble with foreign Customs authorities. At any of the Headquarters the member is furnished with triptyques for the country or countries intended to be visited, and by merely indemnifying the Association through his Bankers

he will be relieved of the necessity for depositing actual cash in respect of the Customs dues levied on cars going abroad.

The A.A. is a safe and sure guide and the best friend of the motor cyclist in trouble.

Further information as to the privileges enjoyed by members of the Automobile Association is obtainable in booklet form from the Secretary, A.A. & M.U., 21, Farnham House, Whitcomb Street, London, W.C.2, and every motor cyclist who has not yet "joined up" should write for a copy.

In answering this advertisement it is desirable to mention "The Motor Cycle."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—First 12 words or less 2/6, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed** Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "The Motor Cycle," 20, Tudor Street, E.C.4. Replies to Box Number advertisements containing remittances should be sent by registered post.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged: when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

CROW Bros., High St., Guildford, have contracted largely for the new A.B.C. Order now for earliest delivery. [5298]

MAUDE'S

NEW MACHINES.

In order to save as much disappointment as possible, we want to make it quite plain that the only way to ensure delivery is to book your order. Deliveries are being made in the order they are received. To leave ordering over, in the hope of buying a machine when you want it, means waiting till next year.

Orders booked with us do not bind you legally to take delivery, you can cancel the order at any date, it only ensures you getting the machine in your turn.

MOTOR

Second-hand Machines.

As our stock changes so very rapidly, a list sent for publication would be out of date on the day of issue. We shall be pleased to forward our list upon application. If possible, we suggest a visit to our Show-rooms, so that you can see the various models we can offer.

1916 3h.p. Enfield, 2-speed, K.S., excellent condition, just overhauled; 60 gns.—26, Addison Av., London, W. [9959]

ENFIELD 1914 3h.p., 2-speed, perfect condition, good tyres; £45.—1a, Devonshire Rd., Holloway, N. (After 6 o'clock.) [9678]

1916 Enfield 2-strokes, new oversize Palmer tyres, mechanically perfect; £37.—McNaught, 29, Sharbrooke Av., Glasgow. [X0400]

1916 Enfield Combination, electric light, all accessories, original Palmer cords; £120.—51, Glenelldon Rd., Streatham, S.W. [9938]

ROYAL Enfield 6h.p. Combination, 1918; £115: or would consider lower power and cash.—Box 3,439, c/o The Motor Cycle. [X0111]

ENFIELD 6h.p. Combination, 1919, fully equipped, lamp, hood, tools, etc., brand new; £160.—76, Handoe Rd., Lee, Kent. [9969]

ENFIELD, 1914, 3h.p., Bosch, Amac, P. and H. lamps, tyres good, 2-speed, running order; £40.—Perrice, Rye Hills, Silloth. [X0366]

ENFIELD 3h.p. 1916 Twin, only ridden 500 miles, lamps, horn, complete, as new; after 5 p.m.: Cooper, 47, Catford Hill, S.E.6. [X0535]

ENFIELD 8h.p. Combination, 1915-16, perfect condition, little used, any trial, lamps, horn, etc.: £115.—Slater, 88, King St., Blackburn. [X0110]

1919 Enfield and Sidecars, new and slightly used, complete with lamps, horn, oversize tyres; £145 to £120.—16, Hesper Mews, Earl's Court. [9594]

1917 Royal Enfield 2½h.p., 2-stroke, 2-speed, free engine, lamp, necessary tools, splendid condition; £44.—Homer, Lister Institute, Chelsea. [9926]

ENFIELD. Sole district agents.—For earliest possible deliveries, try The Layton Garages, London Rd., Bicester. Phone: 35 Bicester. [9335]

6-h.p. Royal Enfield 1914 Combination, speedometer, new tyres and tubes, excellent condition, 3 years store; £130.—Norman Cycle Works, Bridge St., Maidenhead. [9901]

ENFIELD 3h.p. Twin, 2-speed, new Dunlop and Palmer, Bosch shaft drive, just overhauled, gas lamps, horn, pump; £25.—Box 3,440, c/o The Motor Cycle. (D) [X0128]

ENFIELD Combination, 6h.p., new in 1914, hood and screen, nice condition, stored considerable time; £98.—31, Haversham St., Goodwood St., Stapleton Rd., Bristol. [X0605]

LATE 1915 6h.p. Enfield and Sidecar, as new, unscratched, mileage under 3,000, 3 lamps, generators, speedometer, horn, etc.; £100, lowest.—Apply, Box 3,464, c/o The Motor Cycle. [X0426]

ENFIELD 1918 8h.p. Combination, in new condition, run 2,500 miles only, with £12 worth accessories and spares, guaranteed perfect; £130.—Watson, 132, High St., Aldeburgh, Suffolk. [9994]

BRAND New Royal Enfield 8h.p. Combination, Palmer cord oversize tyres, acetylene head and sidecar lamps; £145, no offers; seen after 6 p.m.: C. Willmet, 35, Jervis Rd., Fulham, London. [9746]

ROYAL Enfield, 2½h.p., twin, 2 speeds, chain drive, 1918 B.B., tyres good, camelling and plating as new, 2 lamps, all in excellent condition; 32 gns.—After 7, Davis, 30, Beaconsfield Rd., South Tottenham, N.15. [9646]

ENFIELD, 3h.p., 1915, 2-speed, kick start, P. and H. head lamp, Lore generator, Lucas horn, Coway speedometer, good tyres, Watsonian lightweight sidecar, property of naval officer now abroad, combination good order throughout; £65.—Southfields, Sutton Common, Surrey. [X0454]

1914 Royal Enfield 6h.p. Combination, stored during war, in first-class condition, sidecar just completed, fitted with hood, screen, and spring luggage carrier, 3 lamps, 2 large generators, exceptionally fine engine, the whole in first-class and perfect order; £90: can be seen and tried by appointment only.—47, Broadway, Coventry. [X0389]

Excelsior.

AMERICAN Excelsior; place orders now.—J. Blake and Co., Liverpool and Manchester. [X0441]

1917 Excelsior Combination, 6h.p., 3-speed counter-shaft gear, coachbuilt not done 1,000; £100.—Ellingworth, New Inn Yard, Kendal. [X0116]

A Question of Policy.

As every Motorist knows, there is a dearth of mounts, because for various reasons factories are not yet producing 1919 models in quantity. This state has brought into being the "waiting list," by which means the man who has decided on the make he will ride can place an order covered by a small deposit and rest assured that he will receive delivery in strict accordance with his position on the list, but in advance of the prospective buyer who expects to blow into a depot and purchase from stock. The number of deliveries from stock this side of November won't keep the Registration Dept. very busy.

It is here that the question of policy arises. Shall a dealer accept orders for which he can only pass on the maker's promise of delivery, or shall he refuse to sell until he has the goods actually in stock? We have chosen the former policy because as buyers we had to adopt it or we should be left in the lurch. Imagine a Motor Trader going round the Manufacturers next June, saying, "Sir, all the men in my district go on their holidays next month so I'll buy those 'buses I see in the test shop." Only one guess is needed at the answer.

What about YOU, patient reader, what of your policy? Will you wait to see and then spend the Summer walking, or get on the hated waiting list and ride?

If you fancy one of the good makes we sell, get in now and let us quote you approximate delivery.

MOTOR CYCLES FOR SALE.

Excelsior.

AMERICAN Excelsior Coachbuilt Combination, dynamo lighting, and horn, not ridden since completely overhauled and re-camelled; £110, no dealers.—Hall, 2, Rodney Cottages, Clifton, Bristol. [X9962]

EXCELSIOR, American, late 1916, 7-9h.p., T.T. model, 3 speeds, clutch, kick start, racing sidecar, ear head and rear lighting, Klaxon, speedometer, spares; this machine is mechanically perfect; £120.—Broad, Fruiterer, 76, Hornsey Rise, London, N. [9747]

Fafnir.

FOR Sale, 8-10h.p. Fafnir, 2-cyl. water-cooled engine, complete, with Bosch mag. and carburettor; £20.—A. R. Montgomery, Victoria Rooms, Bristol. [X0278]

F.N.

F.N., 4-cyl., in running order; £22.—104, Blough Rd., Battersea. [1014]

F.N. 4-cyl. 4-6h.p., Bosch mag., shaft drive, engine good condition; £20.—69, King Edward Rd., Rugby. [X0401]

F.N., 4-cyl., 6h.p., clutch, kick start, excellent condition; £45; after 6 p.m.—Apps, 12, Stanley Gardens, Hampstead, N.W.3. [9863]

5-6h.p. F.N., engine perfect, Bosch, fixed gear; highest over 225, or exchange twin; after 7.30.—526, Heckford Rd., Brixton, S.W.9. [9718]

1914 F.N., 2-speed, Bosch mag., horn, front and rear lamps, excellent condition, ready to ride away; £35, no offers.—E.C., 58, Chapel St., Dalton-in-Furness, Laacs. [X9971]

Grandex.

GRANDEX 1914 T.T. 3½h.p., twin Precision engine, Enfield 2-speed, all chain drive, Bosch mag., lamps and horn, tyres good, petrol capacity 3 gallons, good running order; £55, or near offer.—Hesketh, Pleasington, Blackburn. [X9973]

4½h.p. Grandex-Precision 3 speeds, free engine, 4 overhauled, new tyres and tubes in January; would exchange for 2½h.p. Douglas, Enfield, or Levis, or sell £40.—36, Victoria Rd., Askrum, near Doncaster. [X0466]

Harley-Davidson.

HARLEY-DAVIDSON, 7-9h.p., late 1915, only had 3 months' wear; £80.—Arthur Belcher, Wantage. [X0226]

HARLEY-DAVIDSON Combination, believed late 1916, mag. model, Canoelet sidecar, good condition; £100.—Rider, 3, Moorcroft Terrace, Rotherham. [X0280]

HARLEY-DAVIDSON Combination, 1915, mag. model (Bosch), fast, powerful, speedometer, lamps, horn, etc.; £110; consider exchange.—Guest, 73, Church St., Rugby. [X0388]

LATE 1915 7-9h.p. Harley, electric model, 3-speed, kick start, in beautiful condition, been stored during restrictions; £90; ready to ride any distance.—32, Hartley St., Ulverston, Laacs. [X0370]

GENUINE 1916 T.T. Harley, double tank, pedal start, clutch, mileage under 1,000, enamel very good; best offer accepted, or would exchange for good single.—Box L1,163, c/o The Motor Cycle. [1095]

1915 Harley-Davidson, 7-9h.p., 3-speed, mag. model, with Gloria spring wheel sidecar, Triplex wind screen, etc., overhauled and re-enamelled grey; offers above £95.—Walker, Inct Farm, Broseley, Salop. [9852]

HARLEY-DAVIDSON Combination, late 1915, dynamo lighting, Bosch mag., 2 large sets head lamps, magnificent condition, new tyres, etc.; 100 miles trial; £112 cash.—Godfrey Attwood, 13, Park Terrace, Swindon. [X0407]

HARLEY-DAVIDSON Combination, late 1915, to perfect running order, lamps, mechanical horn, speedometer, 2 new tyres, wind screen, appearance as new; best offer over £115; can be seen at Newmarket by appointment.—Wheeler, Gessys Hall, Wickhambrook, Newmarket. [9823]

HARLEY-DAVIDSON 7-9h.p. Combination, 1918 (Nov., '15), No. L13652K, been stored, overhauled, and all like new, electric lighting, electric horn, front and back brakes, luggage rack, hood, screen, apron, mirror, etc., a superb turn-out; £130 cash, lowest for quick sale.—"Moorside," Hereford Rd., Harrogate. [X0211]

HARLEY-DAVIDSON Combination, 1915, bushes and bearings perfect, general condition excellent, been in careful service for total of 19 months, 14 as solo mount, stored whilst owner at the Front, Mills-Fulford coachbuilt sidecar (4-point) fitted January this year at cost 19 gns., tyres new (unpunctured), driving sprocket and chains new, acetylene installation, Klaxon, large tool kit, mag. (Bosch), speed guaranteed, average 30 all day if desired; £95: no lower offer.—Lieut. Millett, St. John's College, Oxford. [X0391]

Hazlewood.

HAZLEWOOD 5-6h.p. Coach Combination, chain, belt, Armstrong gear, all accessories, wind screen, etc.; any examination or trial; £75.—51, Church St., Wolverton. [9766]

HAZLEWOOD, 5-6h.p. J.A.P., engine No. 52508, 3-speed gear box, latest pattern, as new, large sidecar with child's seat, hood and screen, perfect condition; seen by appointment; £115.—67, Marlborough Rd., Wimbledon Park, S.W. Phone: 5414 Ken. [9989]

A Lightweight T.T.

ONE effect of the success of a small two-stroke in the Victory Cup Trial will be a revision of opinion in some quarters concerning this type of machine. Before the war there was a certain hesitation about two-strokes, and the four-stroke seemed to be winning back its old favour. The splendid performance of the Cup winner and his colleague on the smallest engined machines in the trial (less than 200 c.c. capacity) proves that, under favourable conditions and at a set speed, a machine of this type can be regarded as a satisfactory solo motor cycle for ordinary, and even extraordinary, road conditions. That a difficult course of over 126 miles was covered on less than a gallon of petrol shows the economy of an efficient two-stroke, and is a point which, in these days of high-priced fuels, should go a long way further to popularise the lightweight.

In this type of machine we see the motor cycle for the million. Such a machine has many advantages for general utilitarian purposes; it has very few parts, and consequently needs little attention; it is light—as light as, if not lighter than the motor scooter—both points having great bearing upon the question of quantity production and reduction of cost.

For many years this journal has asserted that in the two-stroke engine lay the keynote of the lightweight, and *The Motor Cycle* has consistently encouraged this type of engine. Just before the war we recommended the A.C.U. to conduct a special trial for two-strokes, and, although our suggestion did not bear fruit, a trial exclusively confined to engines working on the two-stroke cycle may become an accomplished fact before very long.

A Cup Offered.

Also in 1914 we offered to the A.C.U. a silver challenge trophy for a separate class in the T.T. races for lightweight motor cycles limited to 250 c.c. capacity. We repeat that offer to the

governing body, as, undoubtedly, there is no better means to develop the small engine and light machine than the conditions imposed during a long run at speed over a T.T. course.

Because the small lightweight is the most suitable and most promising machine for "the million," a tertius class T.T. has a strong claim upon the governing body, and we appeal for the organising of this suggested class in the next T.T. Probably, in view of recent engine development, it might be found desirable to reduce the limit suggested in 1914 to 225 c.c., or even 200 c.c.

A Weight Limit.

As to whether a weight limit should be imposed is a matter for the A.C.U. to settle, should the committee accept our offer. Naturally, the small size of the engine automatically tends to induce designers to reduce the weight of the complete machine as much as possible; but it may be remembered that the average weight of the 1914 Junior T.T. machines which completed the course was over 200 lb., the heaviest being 234 lb., and the lightest 159 lb. True, tanks had a capacity for two gallons of petrol and a comparatively large quantity of oil; but, even allowing for these necessary extras, the weights were considerably higher than is desired for such machines.

The two lightweights which did so well in the Victory Cup Trial weighed about 1 cwt. For a 200 c.c., 225 c.c., or 250 c.c. class T.T., a limit in this neighbourhood might be found suitable.

We are convinced that the time is now ripe for more attention to be focussed upon the lightweight smaller than the Junior T.T. class, and that the A.C.U. might with advantage promote a race for machines between 200 c.c. and 250 c.c. capacity. We hope, therefore, that our offer of a trophy will be accepted, and that the 1920 A.C.U. programme for the Tourist Trophy races will include a class for genuine lightweights.

Occasional
Comments

What Trials do Not Tell.

AT this time of the year we are naturally bombarded by queries which boil down to "What machine shall I buy"? Enquirers often take four foolscap sheets to put the question. I notice a distinct change of tone in these letters since 1914. Many of the querists are concerned with information which a manufacturer's catalogue cannot give. The published results of trials cannot give it. I cannot give it, unless I have ridden the machine concerned far enough or recently enough to have received an indelible impression of its finer points. I am hunting about for a simple Saxon word to cover the subject matter of these queries, but I doubt if anything outside the French *nuance* will do. Briefly, the average buyer is now perfectly assured that any leading make of motor cycle will give him all the reliability, speed, and hill-climbing which he needs. On general grounds, he narrows his choice down to perhaps two or three machines by different makers, and then consults somebody whom he regards as an authority. His interest may concentrate on various details. Here are a few samples: steering, springing, silence, service, chain life, fuel and oil economy, detachability of wheels, top gear pulling, balance of engine at high speed, cleanliness in respect of oil and of mud, brake action and wear, loose nuts, carbonisation rate, valve-grinding period, accessibility, development of rattles, second-hand value, and the like. I think this list covers most of the finer points, the *nuances* which Philip Gibbs might describe as the "soul" of a motor bicycle.

The Parting of the Ways.

IN the past it was broadly taken for granted that all motor cycles were much of a muchness in these subtler aspects of quality. Machines were formerly differentiated chiefly by reliability, speed, climbing power, cost, and weight. On these five points the press, with the aid of competition results and manufacturers' advertising matter, could provide all requisite information. To-day fastidious and experienced riders admit another twenty points into their critical purview, and no man living can deal out facts on them all. A few leading journalists have tested most of the 1919-1920 experimental 'buses, but none of us have yet sampled—to quote one obvious example—the "service" of the many new firms who have already invaded the motor industry, nor do we know whether the old firms are going to offer service of the 1914 vintage, or change their familiar policies. Moreover, of the twenty odd new points in my list of desiderata above, there is not one on which a Six Days Trial of the pre-war type could throw very much light.

Three Deductions.

IN twelve months' time thousands of private owners will be in a position to give definite opinions on all these points in respect of the 1919-1920 models: and "reputation amongst owners" is, therefore, going to count far more heavily than ever it did as a factor in sales and output. A satisfied customer has always been the best advertisement, but customers in our particular industry are becoming super-critical, and they will never again be contented with some of the crude, coarse 'buses which sold freely enough in the old days. Fierce competition lies ahead, and makers will be compelled to listen more sympathetically to the public voice, as soon as the present famine of machines ends. Secondly, the prestige and value of the big trials will tend to decrease unless the organisers are clever enough to incorporate some test of these secondary qualities. Nobody thought a penny the less of the Rolls aero engine because Major Wood fell into the sea off Holyhead, and nobody would think less of the Triumph if their first string dropped out of the next Six Days within ten minutes of the start; nowadays we take reliability within limits for granted where first-class samples of established types are concerned. Thirdly, we need an independent testing laboratory, e.g., at Coventry, to which manufacturers could submit engines for an ordeal approximating to the Air Ministry fifty hour "acceptance" test of a new type of aero engine. A detailed report from such an institution would be more valuable to the manufacturer and more instructive to the public than a long string of gold medals won in road stunts of various kinds.

There would be no difficulty in organising such tests of engines and transmissions to-morrow with a clever man at the helm. I fancy comparative tests of comfort and springing might be devised. One great advantage of such an institute would be its power of curtailing the period during which the "form" of a machine becomes public. At present this period is lengthy. A new model is staged at Olympia in November. The public may buy at sight, and possibly burn their fingers. Or they may wait till after the T.T. (seven months later), or the Six Days (nine months later). They do not want to wait if the machine is sound. The manufacturer does not want to wait, with his capital locked up and earning next to nothing. The proposed testing institute could undertake tests in winter, and would be useful to makers, agents, and buyers. If certain firms shunned such a chance of publicity, we should know what conclusions to draw.

This year, however, many 1920 models will be entered in the Six Days event, and prospective buyers may judge their merits from the results

£1,000 A YEAR AT 26.*By GEORGE HENRY.*

WE were sitting in the club lounge after lunch the other day, and the talk had turned to the wonderful possibilities that modern Business offers the young man.

"The business world is simply crying out for men of mental energy," said Baines. "Any young man—and, for the matter of that, any young woman, too—who can bring an efficient mind to bear upon business problems is sure of a well-paid job to-day. There's a young chap sitting in the corner over there—d'ye see him? Doesn't look brilliant, does he? Just an ordinary personality—a young man of twenty-six. Looks keen in a quiet way, eh! Speak to him, and you'll find that his mind is alive. His brain begins a search for ideas before he gets his shaving water in the morning, and doesn't leave off before he closes his eyes to sleep—even then I'll wager there's some part of his mental apparatus at work.

"One firm alone pays that young chap £1,000 a year for giving ideas."

"And I've no doubt he's worth every penny of it," chimed in the managing director of a well-known manufacturing firm who was in the circle. "We've a young fellow very much in the same boat. He came to us in quite a minor position, something in the stock room. He hadn't been with us three months before he was in my room one day with a scheme for increasing output, worked out to the smallest detail. In six months he'd proved himself, and, frankly, I'd pay him double his present very liberal salary if he asked for it. I couldn't afford to lose his brain."

"Isn't it surprising that so few young men realise the opportunities that surround them?" mused Baines.

"It isn't surprising really," returned the managing director. "Education, or rather lack of education, is at the root of it. We are only just beginning to live down the evil effects of that shibboleth of the last generation—'My son, be contented with your lot.' Too many young men believe that brains are born, not made. They are content to accept the theory that genius is a gift from the gods. As a matter of fact, genius is just super-mental-efficiency. And any mind except a diseased mind can attain it. The most definite proof of the claim is this Pelmanism movement. Some of you are sceptical of Pelmanism; but let me tell you that Pelmanism has done more to bring men and women to a realisation of their powers and possibilities than any other educational factor.

"That young man I spoke of just now—I asked him once how it was that he, who on his own showing, had never aspired to more than a 'thirty-bob-a-week-job,' how it was that he became fired with enthusiasm for my business, how it came about that he gripped the details so well in so short a time, how he plucked up the courage to beard me in my own den. His answer came readily and simply. 'I discovered Myself—I underwent a course of Pelmanism.'

"If every young clerk and salesman did the same, if every young woman who is tapping typewriter keys followed his example there wouldn't be the dearth of £1,000 a year workers that exists to-day. There are managerial armchairs crying out for occupants, and crying in vain, because the people on the stools

in the general office don't trouble to send out an invitation card to Opportunity.

"And as for Opportunity—the opportunities in business to-day are endless. Given the efficient mind, the young people of mental energy, receptivity, creative thought, logical reasoning, and self-confidence can get anywhere. And, believe me, the quickest, the easiest, and the most certain way to get those qualities *in excelsis* is—'Pelmanise.'"

"Why are you so keen about Pelmanism?" asked Baines, as the circle broke up.

"Well, between ourselves," answered the managing director, "I'm a Pelmanist myself."

OVER 500,000 MEN AND WOMEN.

The Pelman Course has already been followed by over 500,000 men and women. *It is directed through the post, and is simple to follow.* It takes up very little time. It involves no hard study. It can be practised anywhere, in the home, in the office, in the train, in spare minutes during the day. And yet in quite a short time it has the effect of developing the mind, just as physical exercise develops the muscles, of increasing your personal efficiency, and thus doubling your all-round capacity and income-earning power.

THE MOST POPULAR BOOK.*By A LITERARY CRITIC.*

THE two most popular novelists in Britain are Nat Gould, who publishes four stories a year and is beloved by the British soldier in the ranks, and Victoria Cross, a million of whose books are said to have been sold during the war.

But, leaving out light fiction like the two classes mentioned, no author has such a wide public as the publicist who wrote "Mind and Memory." This volume has enjoyed the record circulation, in the last two decades, of over 3,000,000 copies. Not only have these copies been circulated—they *have been read*.

I had often read about "Mind and Memory," but I had never the book itself until I received one the other day from the Editor. I understand now how his mind must have been well Pelmanised before he could have crowded into thirty-two pages such a mass of interesting facts and figures, and before he could have made 3,000,000 people read a serious work.

Most serious books I have to criticise are verbose and over-written. Here is a writer who believes in his mission, and then has the organised brain to preach it tersely and without the waste of a word.

The case of Pelmanism is put down briefly and so convincingly that the 3,000,000 copies issued converted 500,000 readers into convinced and ardent Pelmanists. Never surely in the history of literature has a pamphlet or a treatise of any kind—or even such propagandist fiction as "Uncle Tom's Cabin" or "Law Down Your Arms"—had such an astounding result in comparison with the effort involved.

Take my advice: write for a free copy to:—The Pelman Institute, 199, Pelman House, Bloomsbury Street, London, W.C.1.

If you only want to learn how to write convincingly you will find in "Mind and Memory" a lesson for nothing.

In answering this advertisement it is desirable to mention "The Motor Cycle."

THE LONDON-EDINBURGH RUN.

Some Reflections and Advice to Competitors.

It hardly seems possible that the most interesting and best attended of any closed motor cycle trials—the London-Edinburgh run—is actually to take place again after an enforced break of four years.

Previous runs seem almost like dreams, and I am sure even those of us who have competed in this classic event several times look upon this year's run almost as an innovation.

To me the event had become a sort of annual jaunt. I have competed no fewer than eight consecutive years, each succeeding ride seeming to be easier than the last, partly on account of the increased reliability of machines, and partly, I suppose, physical accommodation to the ordeal.

Physical Effects.

In some respects the run is more of a physical test than a test of the machine, and for this reason it must not be treated too lightly. It must be a great disappointment to fail; but, with intelligent foresight, and bar accidents, the coveted gold medal is a "snip."

It has been my practice to give a few hints and tips prior to each year's run—more for the reader who is tackling the event for the first time. I hope anything I write here may help to smooth the difficulties of the long run.

The worst mistake I ever made in this run—the first I rode, in 1907—was to drink a pint of beer with my lunch—and what a time I had from Newcastle to Berwick, for only by sheer force of will could I keep my eyes open, and twice I must have gone to sleep momentarily, to be awakened by my machine bumping on to the grass at the side of the road.

Several strong cups of tea, however, at Berwick kept me going to the finish. To my mind, beer—perhaps present-day beer is far less potent—is the worst possible drink on this run.

Keeping Awake.

If I have anything *en route* between official meal stops it is whiskey. Seriously, keeping awake is one of the points the novice has to study, and, paradoxically, a certain amount of trouble on the road is sometimes a blessing in disguise, inasmuch as it distracts one's mind from the monotony of reeling off mile after mile.

It is generally conceded that the worst section of the run is the first fifty miles or so after lunch. Edinburgh at this stage seems an interminable distance away in spite of well over half the distance having been covered, and until one reaches within twenty miles or so of Edinburgh the end seems as far off as ever.

But to get back to riding hints.

Lamps.

A good lamp, of course, is essential. I used two in 1910, 1911, and 1912, but the two years following only one, as lamps had so much improved. But I carried two generators as a safeguard. Ordinarily, only one refill of the generator is needed, and this is done at Biggleswade, forty odd miles from the start, where, though no time is allowed officially, all riders up to time stop and have a cup of coffee and a sandwich. Fortunately, this year these welcome necessities will again be available, though the food and drink question is not so easily solved for the real meals of the day.

Grantham is the first official stop (half an hour), and a welcome stop it is. The early starters find the day breaking during the last few miles in to Grantham, but the street lights are invariably on, and there is something uncanny, albeit fascinating, in running into this town in its stillness and quietness, except for an odd goods train snorting away at the back of the town.

Food and Warmth.

As regards food here, it is hoped to arrange for this to be provided, but up to the time of writing no definite arrangements have been made. I hope a good hot meal will be available, for one is ready for it at this time of the morning: it is very cold sometimes. I have known frost on the ground an hour out of Grantham.

This brings me to another point: Keep warm and, if necessary, shed some clothes at one of the stopping places later in the day. A wide, warm body belt is a boon, for, besides keeping one warm, it can be pulled up tightly, and the road shocks to the back considerably reduced. Personally, I found this the best tip I ever discovered for long-distance riding on a motor cycle. I hate to think of the possible state of the roads this year, which reminds me of another point. Always be on your guard for freshly laid and unrolled stones. I never remember a run without them, and have cause to remember them in 1908, when I croppered in the dark, a friend carrying my cap off my head with his footrest as he cavorted over the stones. It has not always been possible to get advice of these patches in time to warn riders at the start. They should be looked for between Hatfield and Stamford in particular.

Moderate Speeds.

A word of warning to those who find it difficult to ride at a moderate speed. The continuation of this classic run year after year has only been due to the

committee of the Motor Cycling Club making rules calculated to damp the speed propensities of the minority, who would otherwise ruin the event. The rule that any rider found fifteen or more minutes ahead of schedule time (which is based approximately on legal limit speed, viz., 20 m.p.h.) is disqualified is strictly enforced, and more than once a competitor has to his chagrin had to forego the coveted gold medal after a no-trouble run through. The last four events have been run most smoothly, the police rendering every assistance in guiding the riders, etc., and I exhort every rider to respect the amenities of the road and all speed limits when and where they may be found.

Hills.

In these days of improved mounts and variable gears, the hills encountered on the run are negligible to a well-tuned machine. It is not unusual to experience very hot weather, so overheating is a point to bear in mind.

Dust is another evil, both from the point of view of carburetter and one's eyes. Smoked glasses are a great relief on the interminable white road, and more especially if there is a strong sun.

Riding in Company.

Riding with another motor cyclist is to be commended: while jogging along at an even "twenty," conversation can be carried on, and the monotony relieved considerably. In past events this was only possible to entrants for the medals; the entrants for the special cups, since they did not know when or where they would be timed, had, perforce, to keep dead on time.

As no special awards are put up this year, any two riders starting within a few minutes of each other could ride together, the later starter of the two bearing in mind that his schedule time is later, and not be drawn into the mesh when running into one of the checks.

Setting Watches.

Finally, every entrant should set his watch to official time at the starting point, and compare his time at each checking place, in case a watch objects to the shaking it receives on the way. Route cards should be first given a coating of size. After this has dried, a coating of white varnish, when the cards will be waterproof. Fill in your own arrival and departure times at the various points before treating the cards, these times, of course, being based on your own particular starting time. This procedure saves mental calculations *en route*, which are a bugbear.

H. G. BELL.

Making The Best Of An Old Machine.

A FEW HINTS ON GEAR RATIOS, CARBURETTERS, AND LUBRICATION.

IT is not given to every sidecar enthusiast to possess a brand new outfit. A great many will have to make do with old machines for another year at least, and, apart from the difficulty of obtaining a new machine, we may always assume that the old machines outnumber the new. These lines, then, are written for the man with the old sidecar turnout.

In the text books of a few years ago we read that for sidecar work at least $3\frac{1}{2}$ h.p. is necessary and with a change-speed gear for hilly districts. At the present time, anyone owning even a modern three-speed machine does not need more than one short tour, fully loaded, away from his native heath, to become an ardent advocate of 6 to 8 h.p. for real sidecar work. But we have to

A standard $1\frac{1}{4}$ in. steel piping cap, screwed at the end to suit valve cap thread, gives approximately 32 c.c. extra compression space.

make the best of our old machine. It may be a Triumph, Bradbury, Humber, or Premier, fitted with a Roc, Albion, Millennium, or Bowden two-speed gear—and it pulls a sidecar.

Gear Ratios.

The value of a two-speed gear for sidecar work depends ultimately *ceteris paribus* on the value of its lower speed, because it is this gear which decides whether you can just scramble home up a long 1 in 9 or 1 in 10 rise without shedding your passenger or running alongside.

Of the various two-speed gears in use on old mounts, the N.S.U. gives the "highest" low gear. There is, as most readers know, a reduction of 50% from top to low,

or a rise of $33\frac{1}{3}\%$ from low to top. Thus, if the "top" ratio is 5 to 1, the low gear is $7\frac{1}{2}$ to 1. With an adjustable pulley a top gear of about $5\frac{1}{4}$ may be obtained, which gives the lowest possible gear of $7\frac{1}{8}$ to 1. This gear roughly approximates to the middle gear of a modern three-speed, and, though it would not be of much use in real hill-climbing with a sidecar, a great deal of useful work and pleasure can be obtained from a 4 h.p. machine fitted with such a gear, provided both engine and gear are in good condition.

First, with regard to the machine. It is, of course, essential that compression be good, wheel bearings correctly adjusted, and valves properly ground in. Also, unless the valve springs are known to be new, it will be advisable to fit new ones. Too often is this point neglected and the old ones deemed good enough; but in most cases it will be found that there is a marked difference with new springs fitted, and the experiment is well worth the very trivial amount which need be expended.

The exhaust valve lifter should be carefully examined and so adjusted that the valve seats properly when running. The writer has seen a 1912 machine which had developed exhaust valve trouble, and the cause was finally found to be that the primitive valve lifting arrangement prevented the valve from firmly seating. This only occurred when the engine was running on the road; which made the cause of the trouble rather difficult to locate.

The Stanley belt fastener sheaths are a saving to the belt on low gear work with an adjustable pulley.

Sectional diagram illustrating a worn valve guide.

Making the Best of the Old Machine.—

In many cases, with an old machine, it will be necessary to give special attention to the carburetter and make experiments with different petrols, levels, and jets. If no spare jets are available, one may close up the one in use with a light hammer, and gradually increase the size with needles until the opening giving the best results is obtained. Carburation for sidecar work with an ageing single-cylinder is a very important matter. When a machine is used as a solo mount faulty carburetter setting is not so noticeable, but there is only one carburetter setting really suitable for the sidecar machine worked up to its maximum power, and only experiment can find this.

Air leakage at the inlet valve guide during the induction stroke not only makes starting difficult, but plays an important part in the running of the engine, especially when careful carburation is required as in hill-climbing or running slowly. One of the illustrations given here shows a simple method of overcoming leaks of this kind.

Next comes the important question of lubrication. As one is often called upon to give a good charge of oil to the engine at a second's notice, the hand pump, with which most pre-war machines are fitted, will probably be found difficult to improve upon.

It should always be remembered that it is better to over-lubricate than to use the oil pump sparingly.

Wrapping the belt fastener with a strip of raw hide gives extra grip on the pulley, and is specially useful with a variable pulley gear.

This, of course, is purely a question of judgment, but it may be taken as a good rule to give the engine a full charge before ascending a long hill. While "on the run," half charges every four miles may be more beneficial than a full charge every eight miles. A good quality oil should be used, as there is no economy in buying a cheap oil which inadequately lubricates the engine bearings.

The gear unit should be given attention by an occasional washing out with paraffin and recharging with the lubricating oil most suitable for the type of gear fitted.

As regards belt transmission, it will be advisable in the majority of cases to obtain the lowest top gear possible by means of the adjustable pulley, if such is fitted. It may be found that the belt "jumps" every time the fastener passes over the engine pulley. A Stanley fastener guard is a simple and effective remedy for this, or the fastener may be wrapped with a strip of raw hide, as shown in the

accompanying drawing.

The spokes in the back wheel should be examined, especially if the belt drum is anchored by means of clips to the spokes.

In conclusion, it may happen that, if an overloaded single is used on heavy spirit, it may be beneficial temporarily to lower the compression. A simple method of doing this is shown, a domed cap being in lieu of the ordinary exhaust valve cap. C.R.E.

Motor Cycles for Disabled Men.

LIEUTENANT G. B. HILLING, D.C.M. and Bar, 1st Wiltshire Reg., who is seen on his 6 h.p. A.J.S. and sidecar, was severely wounded in the right leg, which is permanently stiff, and he is unable to use it. He never rode a motor cycle before his injury, but thought that this means of locomotion would enable him to get over his disability and to enjoy touring in the country. The alteration was entrusted to Maude's Motor Mart, 100, Great Portland Street, London, W.1, who, we are glad to announce, are making a speciality of converting machines for the use of wounded soldiers. By means of extending the footrest

Lt. G. B. Hilling, D.C.M., and his A.J.S. outfit, the right footrest of which has been altered to enable him to ride in comfort, although unable to bend his knee.

and the fitting of a special footboard, shown in the illustration, Lt. Hilling is able to stand on the special footboard, work the kick-starter with his left leg, and then mount the machine. The right leg reposes on the special footboard and has no work to do, as all foot controls are arranged on the left-hand side of the machine.

Under such circumstances motor cycling is perfectly safe for people who unfortunately have not the full use of all their limbs; at the same time, it is not to be recommended that anyone so affected should make a practice of riding a solo machine, for their own sake.

Allon Two-stroke Improvements.

Detail Alterations to a Popular Lightweight.

IF evidence is wanted to prove that the two-stroke lightweight is as popular as ever the order files of the majority of two-stroke makers will supply all that is needed. Messrs. Alldays and Onions, for instance, have been obliged to refuse further orders for some time, as the demand was much in excess of the present output of their works at Fallows Road. They are not alone in this respect; many other manufacturers are "snowed under" with orders. Conditions are improving, and every week witnesses progress. Although there are many improvements in details which make for increased accessibility, the latest models are substantially the same as the former Allon production.

Unit Assembly.

The engine unit is now assembled and aligned complete with the gear box, magneto, and silencer on the bench, and the whole placed in the frame *en bloc*. When being decarbonised, the cylinder remains *in situ*, the crank case lower half is dropped, and with it the flywheel, shaft, connecting rod, and piston. The necessary scraping can be done through a large port in the head which carries the release valve dome. The exhaust port has been redesigned, and the pipe is now attached by bolts through two lugs on the pipe.

Frame and tank construction form the principal improvements. Messrs. Alldays claim to be the first to introduce the saddle tank, and all future Allon models will be fitted with a very smart double tank, saddled over the sloping top tube. A U-shaped pipe connects the two compartments at the rear. A sump and filter over the petrol tap is a good feature,

A new type of exhaust pipe connection which takes the place of a manifold cast on the cylinder.

An attractive lightweight outfit. The latest Allon two-stroke with a Canelet-minor sidecar and Rally wheel covers.

while the capacity is one and a half gallons of fuel and three pints of oil.

Efficient metal leg shields are now a standard fitting, also small aluminium covers over the front and rear hub band brakes.

A coil spring hidden in the magneto contact breaker cover enables the former vertical spring and cable stop to be dispensed with, and so gives better access to the sparking plug.

A Severe Test.

The model illustrated is a special order, and, although the makers do not intend this lightweight for use with a sidecar, it is quite capable of giving much good service within reasonable limits.

The Allon spring sidecar coupling. The bayonet fixing can be operated by hand with ease.

The Canelet-minor sidecar as fitted is probably one of the lightest attachments obtainable, but it cannot be termed roomy, and is only suitable for a small person. Nevertheless, a run of several miles in Birmingham traffic, and incidentally over tramlines and cobble paving in an atrocious condition, served to show its capabilities; although rider and

passenger were each about 11 stone, the second speed was very seldom needed.

Rally wheel covers are specially fitted to this machine, but these are not standard.

A lady's model also incorporates the saddle tank, and a belt guard.

The firm's recently patented sidecar lugs are now being made, and give promise of being an excellent fitting. The ease with which they can be manipulated will be the chief advantage; the possibility of detaching or attaching a sidecar by hand, without tools, is certain to appeal to sidecar owners.

Two views of the saddle tank of the Allon. Note the large filler caps, connecting pipe, and the sump over petrol tap.

BAD PETROL AND GOVERNMENT PROFITS.

IN reply to a question as to the profits the Government have made on petrol, it was stated in the House of Commons last week that the accounts between the importing companies and the Government have not yet been settled, but the prices had been fixed to balance as nearly as

possible to cost price after allowing for freight payment to the Ministry of Shipping. On January 31st, Government purchase ceased, and the petroleum companies have since been free to import on their own account, although restricted by lack of storage facilities.

Mr. Joynson-Hicks asked if the companies are allowed to sell decent petrol now, or are the Government insisting on getting rid of old stock and poor quality American petrol. The answer to the question was that the companies were allowed to sell newly imported petrol.

A SPORTING CLIMB.

Ascending Grindon in a Storm on
a 4 h.p. Douglas Sidecar with
Four Passengers.

The 4 h.p. Douglas ascending the steepest portion of Grindon Hill. Observe the state of the surface.

GRINDON Hill is not unknown to competitors in the A.C.U. Six Days' Trials. It has been the Waterloo of many a bold rider with its riverbed surface and steep gradients, coupled with its formidable S bend.

A few days ago, however, a party of Sheffield motor cyclists, mostly well-known riders, decided to settle for their own satisfaction whether the ascent was too steep and too rough for standard sidecar outfits.

They left Sheffield in beautiful sunny weather, and found grand going over the moors to Bakewell, but when dropping down into the village dark clouds gathered on the hills ahead. A distant rumble, along with a clammy atmosphere, warned them of an approaching storm.

Four up on a "4."

From the steep bank into Manifold Valley they got their first sight of Grindon Hill, arriving just as the sky grew dark.

It was decided to get the climb over as soon as possible, owing to the threatened storm. Lots were drawn for the first attempt at the ascent. J. Haslam started off with four up, including himself, riding a 1919 standard 4 h.p. Douglas combination.

As Haslam set off, a great crash of thunder shook the valley, and before he had got to the first S bend, down came the rain. To describe it as rain does not do Nature justice. It was like the opening of some huge mill sluice. The driver and his passengers braved the elements, and scaled the hill in fine style, reaching the top before stopping.

Another Douglas rider followed, carrying three passengers (two in the sidecar), and, with the exception of a slight check on the second bend—through the blinding rain—he also made a clean ascent.

Grindon Hill is without shelter of any kind, so both riders and onlookers were soon wet to the skin, dust-coats not being found waterproof!

Haslam, having climbed the hill with his three passengers, was challenged to attempt the climb with four up, excluding himself. Notwithstanding the loose nature of the surface, and the heavy rain still falling, he again made a clean ascent. The load on one corner nearly pulled driver and machine into the wall, as the bend was taken slightly on the inner side, but the machine picked up well, and finished the rest of the climb with a rush across the roaring watersplash in the top field.

Haslam rode a standard Douglas 4 h.p. machine, and used his bottom gear ratio of 13 $\frac{3}{4}$ to 1.

(Left) To climb Grindon in a rainstorm with one passenger in the sidecar is a good performance, but to take five up under those conditions is a worthy achievement.
(Right) The Douglas pulling well on a steep portion of the hill.

A Selective Clutch Gear for Old Machines.

A Simple Gear Unit to take the Place of the Pedalling Gear of Old Pattern Machines.

UNDoubtedly the sidecar makes a stronger appeal to the average potential buyer than does a solo mount, and any device which helps to make a solo machine suitable for sidecar use is of particular interest at the present time when the demand for sidecar outfits exceeds the supply.

There are available a large number of single geared $3\frac{1}{2}$ h.p. singles, and twins a little larger, fitted with pedalling gear which would be more useful if they had a change-speed device. Two and three-speed hubs are not plentiful, and generally require several alterations to the frame before they can be fitted, but the Rigby gear illustrated has been designed to take the place of the pedalling gear, and with such a gear fitted a comparatively old machine can be brought up to date, with chain transmission and kick-starter, without a great deal of trouble; or, if desired, a chain-cum-belt transmission can be installed.

The engine-shaft is fitted with two sprockets mounted on an extension of the shaft and held thereon by means of a split spring washer and lock nuts, no keys being employed. The countershaft gear mechanism is carried in a shell which is eccentrically bored, and passing through which is the hollow main shaft. Through this hollow shaft runs a push rod, which is given a lateral motion by a double pedal, through which it is operated by means of a quick thread device. At the opposite end of the push rod there is a cross head mounted on two ball bearings attached to two thrust plates having inclined surfaces corresponding with similar faces in the inside of the phosphor bronze

Section of the two-speed countershaft Rigby gear adaptable to almost any machine having pedalling gear.

clutch drums lying outside the main shell, which is mounted on ball bearings. The drums are split in two places on their periphery, and, when not expanded, form bearings for the pair of large chain sprockets.

All the ball races are adjustable, and the working parts are enclosed in a dust-proof case. The conversion set includes double engine sprocket, chain sprocket and adapter for rear wheel chains, the countershaft gear and aluminium cover, or, where chain-cum-belt transmission is

required, with a pulley in place of the small sprocket for the final drive. The gear reduction is 50%.

This gear is specially suited for all Triumphs from 1906 previous to the countershaft model, Bradbury, Matchless, Premier, Rover, B.S.A., Rudge, Singer, and similar machines with pedalling gear. The gear is the patent of Mr. E. J. Rigby, of Prescott Road, St. Helens, Lancs., who is open to grant licences to one or more first-class manufacturers of motor cycles or units.

A Matchless twin, formerly single geared and belt driven, now a two-speed countershaft chain-driven mount.

An old pattern Triumph fitted with the Rigby two-speed gear conversion set.

READERS' ROAD REPORTS.

THE following is a selection of the reports received from readers on the state of the roads in various parts of the United Kingdom:

Shrewsbury to Sanderstead (Surrey) via Ironbridge, Bridgnorth, Kidderminster, Worcester, Tewkesbury, Cheltenham, Cirencester, Faringdon, Wantage, Reading, Sandhurst, Bagshot, Guildford, Dorking, Reigate, Purley: Rough to Ironbridge, fair to Bridgnorth, thence better to Worcester, good to Cheltenham, fair to Cirencester, fairly good to Reading (though rough in places), good to Bagshot and Guildford (avoid road via Ash), loose

stones in places to Reigate, good to Smitham, and then bumpy through Purley. Return route—South Croydon, Waddon, Sutton, Cheam, Ewell, Hook, Weybridge, Chertsey, Staines, Henley, Oxford, Chipping Norton, Evesham, Worcester, and then via Wenlock to Shrewsbury: Bumpy to Waddon, good to Cheam, slightly bumpy to Ewell, rough to Weybridge, fair to Staines, but loose stones in places and on to Maidenhead, thence good to Henley and Oxford (except last five miles), fair to Chipping Norton and Evesham, although bad ruts in places where timber haulage has taken place, fair to Worcester. Bridg-

north to Shrewsbury better via Wenlock than Ironbridge. Throughout the whole route there is a tendency in places to fill up pot-holes with loose stones and trust to the traffic to grind them in. The road Worcester - Stourbridge - Wolverhampton - Shrewsbury is fairly good.

The hill known as Black Forest Hill in Devon, from Starcross to Haldon, is "up" for miles at a stretch, and a Canadian lumber camp light railway takes up half the roadway. The alternative is to go via Kanton, which joins the hill about one-third of the way, where the surface is quite good.

WHEEL BEARINGS.

A Suggestion for Simpler Adjustment by Eliminating the Troublesome Lock-nuts.

OFTEN have I sighed, not only for truly waterproof hubs, but for wheel cones that could be more simply and quickly adjusted. Lack of proper adjustment in this direction is one of the commonest neglects on the part of the everyday motor cyclist, especially when a sidecar is attached. The owner of the outfit, having packed his hubs with grease, proceeds cheerfully to forget all about them, and one day, finding one of his wheels a little loose, he decides to postpone till to-morrow the troublesome business of fishing out special keys to make the adjustment, and so forgets it again. In the meantime, mud and water get into the bearing, and when next his attention is drawn to it the damage is done, the cone unevenly worn, and so there is nothing for it but to fit new cones if the wheel is to be restored to its pristine order. I have examined a whole collection of machines at a second-hand store, and have found at least eighty per cent. of them badly out of adjustment as regards wheel bearings and steering heads, and so it is with the majority of machines on the road—simply because the ordinary novice avoids the ticklish business of tinkering with narrow, jammed-up, cone nuts.

Practically every rider in France discovered that wheel bearings were a prominent weakness in present-day design, while the present state of the roads in England, and the amount of stagnant water they carry, demands constant watchfulness, or wheel troubles soon crop up. When a sidecar is attached the front wheel of the motor cycle is the first offender, the sidecar wheel is a good second, and it is only a matter of time in the rear wheel, which, usually the sturdiest bearing of the three, develops a considerable headache in pursuit of the others. The sidecar acting as a stabiliser, the defect is not noticeable till considerably advanced, by which time, as already stated, the harm is done. I suggest that if wheel cones were more instantaneously adjustable, trouble in this direction would be less common.

A Suggested Simplification.

Wheel bearings could very easily be designed so that they could be adjusted simply by the application of the fingers, no keys being required other than

the standard wheel spindle key every rider carries. Personally, I should be very glad to see the last of thin cone lock nuts, requiring their special spanners—nuts with inadequate gripping surface, which have a knack of jamming, so that the slender jaws of the spanner soon yield to the labour of unjamming them. If they do not jam they are apt automatically to alter their adjustment, the wheel becomes a trifle slack, and so trouble is stored up for the future. I have known wheel bearings to become absolutely unadjustable to any nicety, owing to the constant attention they have required, and though it may appear that I am making the most of the alleged weakness it is, nevertheless, fairly clear that an improvement in design, eliminating the weaknesses referred to, would be a considerable step in the direction of perfection.

A suggested method of bearing adjustment recommended by the writer. A milled disc takes the place of a special spanner. A further step would be as shown on the right, a short lever fixed permanently to the cone.

Accompanying is a rough sketch of a design which would render the wheel bearings adjustable simply by turning the milled head of the cone after slackening off the spindle nut. The sketch does not intend to convey more than the idea for adjustment. The forks would be arranged to spring open sufficiently to permit the disengagement of the shallow locking ratchet, the slips between the notches of which would not be too great for fine adjustment. When the cone had been adjusted by the finger and thumb it would be held in the vice-like grip applied by the tightening of the spindle nut. There could be no doubt as to the permanency of

the adjustment, which could be done in a few seconds after loosening off the spindle nut. It will be seen that the adjustment disc cannot turn because it is ratcheted to the fork. The main body cannot turn because it is on the square spindle, which passes through a square hole in the fork.

The only objection one can think of to this arrangement is that there might be some wear, resulting in play in the thread of the cone, and on tightening up the spindle nut the wheel would be found a shade tighter than intended, but this could easily be allowed for in the setting, and, at any rate, occurs to some extent in present-day design. The adjustment cone would, of course, have to have a good long thread, as it would be called upon to bear the whole pressure applied by the tightening of the spindle. **CHINOOK.**

ANOTHER MIDLAND HALF-DAY TRIAL.

ON Saturday, the 31st inst., the South Birmingham M.C.C. will hold a half-day reliability trial over a sporting course of about sixty miles. There will be two classes, for machines above 300 c.c. and for those below 301 c.c. The club awards will be the Allday Cup (value sixty gns.) for the best performance of any rider, and the Joyce Shield for the best "amateur" performance. There will also be gold,

silver, and bronze medal awards to the first, second, and third in each class. A secret check will be taken, to be used only in case of a tie.

The start will be from the Mermaid Hotel, Sparkhill, at 2.30 p.m. Entries close on Saturday next. The event is open to members of the S.B. M.C.C. only, the trials secretary of which is Mr. E. Roberts, 26, Cumberland Street, Birmingham.

NORTON SIDECARS.

An Attachment in keeping with the Design of the Big 4.

NORTON MOTORS, LTD., do not believe in half measures. The reputation of their big single for power and reliability necessitates a sidecar in keeping with it, and with this object in view the firm are setting out to produce a most attractive outfit.

Formerly their sidecar chassis were built to their order, but they intend taking up this branch themselves. Mr. W. J. Hassell, the works manager, is responsible for the design, and he has been at some pains to ensure a frame and connec-

tions which shall form a suitable combination with the "Big 4" model.

The sloping front connection has a small lug which takes the end of the footboard supports, and this forms a triangulation which makes for considerable strength. The telescopic tube to the seat-pillar lug has three movements, and the rear axle attachment has two movements, so that the range of adjustment is unusual. One of the chief points is in the construction of the radial joints at front and rear. These allow a range of movement sufficient

for all purposes without sacrificing rigidity in the slightest degree. Springing follows the firm's former practice, and the body may be very easily detached from the front springs and lifted up out of the way, thus facilitating adjustments.

A type of Norton sidecar of which little

An innovation on new Norton sidecars is the fitting of a small screen for the child's dickey seat.

has been seen, although it has been made for several years, is the dickey seat model. In the rear locker is a folding seat fitted with an upholstered back, and on the latest model a detachable screen is fitted.

Production troubles are being cleared up, and Norton models, both machine and sidecar, should be coming through during the next month.

The newly-designed chassis to be used for the 1919 Norton sidecars.

Valve Speed in Proportion to Piston Speed.

An American Valve Operating Mechanism aiming at Greater Engine Efficiency.

ALTHOUGH, at first sight, not extremely novel, the valve operating mechanism illustrated here is an attempt to obtain certain results which are not immediately apparent.

The aim of the invention is to assure the opening or closing of each valve at such a rate as to afford an area of valve opening in direct proportion to the speed of piston travel, with a view to maintaining a constant velocity of the inlet and exhaust gases, and thereby lessening the effect of gas inertia.

Piston velocity is higher at the inner end of the stroke than at an equal distance from the outer end, and reaches a maximum at a point in between the inner end dead centre and the mid-point of the stroke. This fact makes it advantageous to open the inlet valve and to close the exhaust valve quickly, as it is at the points mentioned that the piston exerts the greatest effect upon the mixture and exhaust gases. Thus, by correctly pro-

A valve gear designed to give valve opening and closing at a speed in proportion to piston speed.

portioning the length of the cam follower, it is feasible to maintain the area of valve opening in constant ratio to the velocity of piston travel during that period and to obtain a maximum valve opening at the time of maximum piston speed.

Mr. R. W. Phelps, of Rock Island, Ill., U.S.A., the patentee of the device illustrated, attains this end through a symmetrical cam operating both valves and imparting to one a quick closing and to the other a quick opening. The variation between rates of opening and closing of the valves is due to the varying radial distance from the point of contact between the cam face and the flat face of the follower to the pivot of the latter. The point of maximum valve lift may be advanced or retarded relative to the point of opening by varying the position of the pivot. With the more conventional form of valve gear this occurs midway between opening and closing, and rarely at the time of maximum piston speed.

MOTOR TAXATION AND THE ROADS.

THE following resolution was unanimously passed at a recent meeting of the Motor Legislation Committee:

"This Committee regrets that no assurance has been given by the Chancellor of the Exchequer that the proceeds of taxation upon motor vehicles and motor fuel shall revert to the purpose for which it was originally imposed.

"The increased taxation was accepted by the motoring organisations in 1909

on the understanding that the proceeds should be devoted to the Road Improvement Fund, and be administered by the Road Board. This revenue was diverted to the general purposes of the Exchequer in 1915 as a purely war emergency measure.

"This Committee desires to record its opinion that the restoration of the Road Improvement Fund from January 1st, 1919, alone affords highway authorities

the assurance of the financial resources to carry out the urgent work of road reconstruction and improvement necessary to meet the immediate requirements of all classes of road traffic; and, further, that until the Central Road Authority has secured an annual income, they will be unable to exercise their borrowing powers, by which alone sufficient funds can be raised to carry out at once a national scheme of road reconstruction."

Single-cylinder motor cycles on Glendoe during the Scottish Six Days Trials of 1914.

IT is a little difficult to define what one means by a "sporting" motor cycle. For some folk the mere externals of the machine fill the bill. Drop the handle-bars, remove the entrails of the silencer, wear a leather skull cap, with sausages over the ears, fit a speedometer dial graduated up to 80 m.p.h., and then you are a sportsman. For another type of mind it is enough to own a machine of a make which has figured largely in the archives of Brooklands and Manxland, and on occasions to ride it rather fast. For persons of a truly detestable kidney, the word need not mean more than to find Kingsway clear of traffic and free from police, to roar up it at forty with an open exhaust, making everybody stare, and then to shut down and creep winking into Holborn with the air of being "one of the boys."

The True Sportsman.

I offer a different interpretation, and present it by means of an illustration. In 1914 (?) the Rudge team for the Scottish Trials was entered with belt drive and a bottom gear of $6\frac{1}{2}$ to 1, as compared with the chain drives and 10-15 to 1 emergency ratios of most of their rivals. I do not know the inner history of this brave effort. Probably neither the firm nor the riders were aware of the calibre of the hills along the route. Had those hills been even moderately straight, the high-g geared Rudge would have stormed them at terrific speeds. But you cannot climb precipices on a high gear unless you can keep up your revs.; and you cannot keep up the revs. on a $6\frac{1}{2}$ gear round corners which represent a Cubist artist's impression of a true lover's knot. At the start the cognoscenti averred that the first big hill would behold the *débâcle* of the Rudge crowd. But they had not reckoned with the sportsmen in the Rudge saddles. I have admired many motor cycling deeds of derring-do, but I never

saw anything finer than the pluck and skill of some of the Rudge jocks. They swept up to those appalling corners—"blind" ones, in some cases—at crazy speeds. They "lay over" as far as their footrests would let them till their bicycles assumed the angle of a spun penny on the verge of collapse. They cut their engines out at the psychological second, wrenched the hurtling jigger round in a steep "bank," and slammed on full engine again. If they fell, as sometimes *had* to happen, they were up and running furiously to re-start on 1 in 5 goat tracks before any man could lift a finger. This was sporting work, jewelled and machine polished. *They were setting their mounts at fierce, dangerous, all but impossible feats.*

Now that a non-sporting mount costs £85 or so, many of us are being forced back upon the cheaper single-g geared solo machine. And why not? Tone down the Rudge picture a little, and what sort of riding contains more zest and thrill to the square millimetre? The 500 c.c. single-gear, belt-driven for preference, can be taken almost anywhere in Great Britain by the right sort of man. Major W. G. McMinnies, R.A.F., in the last Scottish Trial got a T.T. Triumph up the Kenmore side of Amulree in pouring rain. He stripped to his socks, so to speak, to do it, sending his kit on by train, but he did it. Main road hills in England and Wales are less formidable: a moderately good rider, in full touring kit, can wangle a T.T. single up nearly all of them if he knows his business, and it is just the spice of uncertainty that tickles one.

Having no gear box or free engine wherewith to camouflage indifferent tuning or clumsy driving, the sportsman must know his machine inside out. A new machine of this pattern will start in two yards; three months later it may need a lot of pushing about unless

The Sporting Single.—

the owner studies and pets it. Ham-fisted work with the controls reveals a rider's deficiencies: he tries to cross London from north to south or east to west on it, and spends a sweaty, weary couple of hours, conking out behind slowed taxis or seeking a cranny in the traffic big enough to give him vantage for a starting run. A month later his deft forefinger slides the throttle in quarter-millimetres, *tock—tock—tock* (very slowly, leaving room ahead), and then in quick time, *tockety, tockety, tockety*, as a gap opens and he nips through the block with never a dismount. When the surge of packed vehicles comes to a dead pause, he must stop with them: but, knowing his job by now, he is restarted on the decompressor before the 'busmen have let their clutch pedals up.

The Supreme Test.

If traffic is perhaps the supreme test of single-gear driving, hill work is certainly a very close second, even in England where real hills are far to seek. In the novitiate of sportsmanship a little mechanical assistance is possibly desirable. A Rudge-Multi or the simpler Zenith models or a Philipson pulley gives you a bottom gear which is higher than the second ratio of many countershaft boxes: and the non-sporting driver is usually forced down to first gear on Sutton. So a novice tackling our more difficult hills on such a machine is at least semi-sporting. But there is better fun to be had—from this special standpoint—in a *pukka* single-gear, without any reserve but maybe an adjustable pulley and a spare belt or a three-length fastener.

Years ago the late I. B. Hart-Davies and F. Hulbert used to go "prospecting for pimples" on single-gear Triumphs with adjustable pulleys, and "H.-D." told me shortly before the crash that killed him that flying was no better fun than these hill-jaunts. I have ridden many, many thousands of miles on tour and in trials, but 1911 stands out as my golden year. I rode a $3\frac{1}{2}$ h.p. Rudge with an N.S.U. gear giving a $5\frac{1}{2}$ to 1 gear, plus incalculable friction. It was always touch and go on the knuckle of a really bad hill; and that kept me fresh and interested, for quite a lot hinged on every feel of the carburetter levers.

A Thing of Pep and Life.

In between thick traffic and stunt hills the single-gear is the most charming mount on the roads, and to my mind no car can approach it, whilst the three-speeded tourist is dull and utilitarian by contrast. In the garage your single-gear T.T. belt-driven is as docile as a baby two-stroke—you can lead it about with a forefinger, or pick it up and dandle it. Outside the garage door you can heave it off without appreciable effort, whether the road be steep or flat. Get it running, and nothing short of a racing car has the same pep and life. It answers its spark and throttle as a live thing should. Its noise is clean—just the bark of the hot gases behind you, and the sharp clack of the tappets near your right knee—no confused smother of squeaks and rattles and growls from a hundred different stresses in as many frictional parts. And the *simplicity* of it! When the back tyre begins to thump, off with a couple of nuts and the wheel is adrift. If you keep a watchful eye on the belt in the garage, you need never touch it by the roadside, unless you venture among mountains in a

wet week. There is nothing else to go wrong, except the veneer of tune: and the sportsman enjoys tracing those lost 100 r.p.m., or the secret cause of a growing sulkiness in producing the first pop.

Since weight is a matter of account with these thoroughbreds of the road, the owner is protected from many inanities. Let the dud rider pack the panniers till they bulge: strap a flat case on the carrier, containing umpteen spare chains in grease-proof paper, a £2 case of magneto bits, and other absurdities; and finally ruin the set of his jacket and breeches by depositing further reserves of greasy iron-mongery in his pockets. What does the single-gear man carry? A Patchquick set. A 4in. King Dick. A knife. A belt-punch. Maybe a plug. A "plus sign" vest-pocket screwdriver. Not much more. Moreover, and for similar reasons, he is protected against one of the more ridiculous instincts of our fallen nature. I mean the "acquisitive" faculty by dint of which accessory dealers wax fat. Put the average motor cyclist down in front of the proper counter at Gamages, or Hunts, or Dunhills, with £5 in his pocket, and he will have to walk home in nine cases out of ten. His purse is the sole limit of what he will buy. Leather cases for belts and inner tubes and plugs and tyre kit. Mascots galore. Map cases. Watch cases. Containers for spare carbide. Weird alarms. Patent switches. Reverse mirrors. Badges. Muffs and gloves. Body belts. Goggles. Lubricators in amazing variety for every component of the machine. Tail lamps by the half-dozen. Densimeters. Voltmeters. Ampère meters. We all do it. I've done it. I shall do it again shortly. But you cannot insult the self-respect of a single-gear T.T. by bedecking it with these pretty toys.

Choosing a Wife!

The girl? Ah, there's the rub. When the hateful Percy comes along with a sprung wheel sidecar and electric dynamo and exhaust footwarmer and windscreen, you think he'll cut you out! Let him. It's a sound test. If she's after money and comfort and swank and soft cushions, let her go. It is not every girl who is worthy of a seat on the carrier of a fast T.T.: and those who are generally make good wives. But—just *pour passer le temps*? Oh, run away and get a four-speeder with a sidecar if you can afford it.

J. G. Poole, captain of the Nottingham and District M.C.C. Mr. Poole is the Nottingham representative of Messrs. Rudge-Whitworth, Ltd., and for years has been a keen supporter of the competitions held by this very live Midland club.

1,000,000 MOTOR CYCLISTS POSSIBLE.

The Scooter and the Question, Why Stand? A Case of a Fly in the Ointment.

THE sporting spirit which permeates the whole motor cycle movement was well exemplified by the complimentary dinner given to Mr. Frank S. Whitworth on Friday evening last at the Wheel Club, Birmingham. Mr. Whitworth is known to many of our readers as a competition expert, not only astride a motor cycle—he was usually seen on a Douglas—but also as an organiser, for he is a leading light in the Sutton Coldfield and Mid-Warwickshire A.C. For many years past Mr. Whitworth has held an important post with the Colmore Depôt, but is now commencing a new business under the title of F. S. Whitworth, Ltd., as agents for cars and motor cycles, and premises have been acquired in New Street, Birmingham. His former chief, Mr. E. C. Paskell, proprietor of the Colmore Depôt, was in the chair, and the gathering consisted of many motor cycle trade celebrities, from London and the Midlands, the North being represented by Mr. G. E. Rigby, of Manchester.

Beside the speakers there were present, among others, Messrs. Humphries and Dawes (O.K.), Mr. Cochrane (Best and Lloyd), Mr. Downes (New Imperial), Mr. Allday (B.S.A.), Mr. Eason (A.B.C.), Messrs. H. Smith, J. St. John, P. Mose-dale, H. R. Lane, R. H. Henderson, E. King, P. Olai (Amac), C. H. Gough, and J. Urry.

Naturally the great possibilities ahead of the motor cycle industry were the subject of constant reference by the different speakers. Mr. Paskell, in wishing Mr. Whitworth success in his new venture, stated his conviction that the market for motor cycles was in the neighbourhood of 1,000,000. The figure of

250,000 was given as the existing number of roadworthy motor cycles in this country, so that the extent of the promised expansion of the movement might be gauged. Later Mr. Granville Bradshaw, the designer of the A.B.C., who had driven from London on his Rolls-Royce, voiced the opinion that the motor scooter was not being regarded sufficiently seriously. He considered that that type of machine had a prosperous future, particularly among ladies, and especially those living on the outskirts of a town, for they would adopt the scooter in their thousands for shopping expeditions. At first he had somewhat scoffed at scooters, but he now readily acknowledged his mistake, and was quite enthusiastic as to their future. This conclusion, too, had been arrived at after experiments with an engine fitted to the front and rear wheel—he favoured the latter method—and after testing his latest scooter creation with 1½ cwt. of luggage. Here is a chance for the enterprising milk boy, paper boy, and messenger boy.

Mr. Alec Ross (Bowden's), in the course of an amusing speech, advised all his trade *confrères* to cultivate the press—as he had done—especially drew Mr. Bradshaw's attention to the dates of the Arbutnot Trophy Trial (July 4th and 5th) and the Six Days Trials (Sept. 15th to 20th)—reviewed what the specialised press had done for the industry—particularly on the sporting side—and pointed out the indispensability of that section of the press to the automobile movement.

Again, Why Stand?

Mr. Geoffrey Smith (Editor, *The Motor Cycle*), who responded, expressed appre-

ciation of the spirit of *camaraderie* evident that evening among men who were supposed to be trade competitors. He regarded the friendly feeling shown that evening to a new trade competitor indicative of the true spirit of the best types of sporting motor cyclists. Mr. Bradshaw had chided him for apparent lack of enthusiasm for scooters. He inclined to the opinion that the daily press enthusiasm would wane, and buyers would demand a seat to their scooters and other features of accepted motor cycle design, and thus we should arrive at the true lightweight motor bicycle, with which he was satisfied as it possessed a far wider range of action.

Mr. Bradshaw Tells a Tale.

During the evening an amusing incident occurred. Mr. Geo. Stevens (A.J.S.) seemed very troubled because Mr. Bradshaw, who arrived late, explained that he had experienced delays on the road, first, by a fly getting into the jet, and again by unbalanced steering, due to changing one of the front wheels, which necessitated a second stop to set matters right. Mr. Stevens, quite overcome with such a story, retired to a corner convinced that this was leg-pulling of the highest order. How could the fly have got into the jet, he pondered, surely that meant *via* funnel, petrol tank, feed pipes, gauges, etc. And who ever heard of steering being balanced during a fast road trip? Returning to the fray, Mr. Stevens and Mr. Bradshaw were several times seen arguing the matter out, evidently to the satisfaction of both, for they toured the A.J.S. works at Wolverhampton in company on Saturday morning.

THE M.C.C. LONDON-EDINBURGH RUN.

ENTRIES NOW NUMBER 114.

AT the time of going to press 114 entrants had been received for the London-Edinburgh run at Whitsuntide, which we give below:

SOLO MOTOR CYCLES.

W. Cooper (3 A.B.C.)
W. C. Hemy (2½ Metro-Tyler)
A. C. Robbins (2½ Wooler)
R. L. Williamson (4 Triumph)
Fred Notari (4 Triumph)
N. Rycroft (4 Triumph)
G. A. Reed (2½ Coulson B.)
E. M. P. Boileau (3 A.B.C.)
R. C. Boxer (4 Triumph)
J. T. Ross (4 Triumph)
P. W. Moffatt (spring frame 3½ Douglas)
A. Cocks (2½ Clyno)
T. H. Weaver (2½ Sirrah-Verns)
Tudor Thompson (2½ Douglas)
J. A. Watson-Bourne (4 Blackburne)
R. T. Leather (2½ Douglas)
H. E. Walker (2½ Hobart)
R. W. White (4 Triumph)
H. Le Vaack (3½ M.A.G.)
H. C. Nais (3½ Rudge Multi)
A. J. Sproston (3½ Lea-Francis)
W. R. Preston (3½ Sunbeam)
F. H. Ronsley (8 Zenith)
C. H. Hunt (3½ Zenith)
L. A. Baddeley (2½ Douglas)
Vivian Olsson (4 Douglas)
G. T. Udall (2½ Chater-Lea two-stroke)
G. F. Glen Kidston (3½ Sunbeam)
L. de Arango (7-9 Harley-Davidson)
W. G. Harrison (3½ Norton)
W. J. Lake (2½ Omega)
P. J. Enticknap (4 Blackburne)
P. Pike (2½ Lewis)
A. Hill (3½ Zenith)

H. R. Harveyson (6 Matchless)
P. T. C. Body (3½ Sunbeam)
H. Walker (2½ Lewis)
J. F. Hull (2½ Wooler)
J. A. W. Armstrong (3½ Lea-Francis)
A. M. C. Scott (5-6 James)
G. F. Ammon (2½ Metro-Tyler)
C. W. Addingley (3½ Humber)
J. E. Addingley (4½ B.S.A.)
J. Smithies (2½ Allon)
W. S. Jameson (6 A.J.S.)
H. Minton (3½ Sunbeam)
C. S. Baddeley (—)

PASSENGER MOTOR CYCLES.

J. Emerson (3 A.B.C. sc.)
J. S. Holroyd (8 Blackburne sc.)
Thompson-Thompson (4 Douglas sc.)
G. A. Bridgman (7 Indian sc.)
Rex Mundy (8 Matchless sc.)
James McKenzie (6 Humber sc.)
A. Mabon (4 Mabon sc.)
W. A. Fell-Smith (7 Harley-Davidson sc.)
J. Stevens (6 A.J.S. sc.)
R. C. Davis (8 Chater-Lea sc.)
J. Haslam (4 Douglas sc.)
F. D. Walker (4½ B.S.A. sc.)
J. L. Stocks (3½ Ariel sc.)
Gordon Fletcher (4 Douglas sc.)
H. H. Saddington (5-6 James sc.)
Hugh Gibson (8 Clyno sc.)
T. C. Delahay (3½ Sunbeam sc.)
W. B. Gibb (3½ Douglas sc.)
T. H. L. Witt (6 Enfield sc.)
E. G. Johnson (4 Douglas sc.)
John Godsal (8 Bat-Jap sc.)
W. P. Tippet (4 Rex sc.)
R. C. Osborne (7-9 Harley-Davidson sc.)
John Hilger (3½ Rover sc.)
A. J. Read (8 Sunbeam sc.)
F. E. Saehar (3½ Rudge sc.)
Leslie Pulham (3½ Ariel sc.)

F. H. Douglass (7-9 Harley-Davidson sc.)

E. Milton (5-6 A.J.S. sc.)
Kaye Don (8 Zenith sc.)
S. Julian (6 A.J.S. sc.)
F. Smith (8 Clyno sc.)
W. A. Jacobs (8 Rex sc.)
J. P. Le Grand (6 Rex sc.)
Frank White (6 Rex sc.)
A. G. Douglas Cleese (4 Norton sc.)
Sidney F. Garrett (8 Blackburne sc.)
W. H. Eggington (8 Sunbeam sc.)
S. Sawyer (4 Norton sc.)
F. T. Jonas (3½ Ariel sc.)
S. A. Applebee (7 Indian sc.)
E. Atkins (3½ Ariel sc.)
A. Carlton (7 Indian sc.)
S. J. Ellis (8 Matchless sc.)
R. Hoywill (6 A.J.S. sc.)
G. W. Wierkin (5 Brough sc.)
J. R. Lane (4 Douglas sc.)
T. B. G. Vale (8 Enfield sc.)
J. D. Campbell (6 A.J.S. sc.)
D. R. O'Donovan (4 Norton sc.)
G. Stevens (6 A.J.S. sc.)
J. Hargreaves (4 Norton sc.)

CYCLE CARS AND LIGHT CARS.

G. A. Nash (10 G.N.)
— Hay (10 G.N.)
G. G. Blakey (9.5 Hillman)
W. H. Oates (11.9 Lagonda)
G. C. Stead (10 A.C.)
T. H. Birch-Reymard (12 Clegg Darracq)
Y. Addis (10 Aston-Martin)
C. J. Myson (10 Singer)
A. Noble (10 A.C.)
G. W. Brownsort (10 A.C.)
K. A. McDonald (8 G.W.K.)
C. A. H. Mason (11.9 Morris-Cowley)
H. C. Vadis (10 A.C.)
A. J. Duncan (8 Duncan cycle car)
J. Van Hooydonk (11.9 Phoenix)

Times to Light Lamps.

SUMMER TIME.

May 22nd	9.21 p.m.
" 24th	9.25 "
" 26th	9.28 "
" 28th	9.30 "

Police Trap.

We learn that a police trap has been working over the week-end at Castelnaud, just past the bend and between the Boileau Arms and the Red Lion.

A.A. Glasgow Offices.

The Glasgow office of the A.A. is now at 23, Royal Exchange Square, Glasgow. The telephone number and the telegraphic address will be as heretofore.

Ten-mile Limit.

The police are very active on the Kew Road, from Kew Bridge to Richmond, at week-ends. Many motorists enjoying the opportunity afforded by the spring weather fall victims to the policemen's stop watches. A ten-mile speed limit begins near the end of this road, just on entering the town.

Government Petrol.

Mr. Kennedy Jones asked in the House last week whether the petrol sold to-day is all Government petrol, and in answer to that question it was stated that besides the Government petrol, of which there were large stocks when the war stopped, other petrol is now on the market.

A Panacea for all Ills.

A correspondent complaining of overheating of his engine enquires whether he had better submit it to an engineer for overhaul or fit a steel cylinder. There is something fascinating and wonderful about steel cylinders to the lay mind, but in this case a pair of new tyres would probably be as effective.

Cycle Cars in France.

The makers of the original cycle car, the Bedelia, 32, Rue Félicien-David, Paris, are placing two models on the market, a single-cylinder at £107, and a two-cylinder sold at £142. The single-cylinder model is complete with hood, screen, lighting, horn, and toolkit. Its engine is a 4 h.p., and the change of speed is by variable pulleys, allowing (so it is claimed) all hills to be climbed. The consumption is 88 m.p.g., and the average speed twenty miles an hour. The two-cylinder is a sporting type, petrol consumption 50 m.p.g., average speed 50 m.p.h., and it is claimed to climb hills at 30 m.p.h.

Additional Identification Marks.

In addition to the existing distinguishing index marks of various counties, the following identification letters have been assigned in addition: London County, LX; County Council of Lancaster, TB; Surrey, PB; Borough of Birmingham, OE; County Borough of Manchester, NB.

Huge Motor Scheme Successfully Launched.

The first share issue of the British Motor Trading Corporation, Ltd., the largest organisation of its kind in this country, with a capital of £2,000,000, has been over-subscribed. It shows that the public and the trade recognise the need for expansion and progress, without which we have but little chance of competing successfully for the colonial and foreign trade in motor vehicles.

The Institution of Automobile Engineers.

The programme for the next session of the Institution of Automobile Engineers appears to be interesting. Papers have already been secured from Mr. Ricardo, Dr. Aitchison, Dr. Ormandy, Mr. W. M. Hackett, and others. Among the subjects to be dealt with will be engine design, valve failures, volatile fuels, production of steel tubes, producer gas for vehicles, cast iron for use in automobile construction, etc., while it is hoped to obtain an important paper on American practice.

It is intended to hold a special session of the Institution during the period of the Olympia Show, which will be

Special Features.

MAKING THE BEST OF AN OLD MACHINE.

THE SPORTING SINGLE.

THE LONDON-EDINBURGH RUN.

arranged in such a way as to give members an opportunity of meeting the president and council.

A useful feature of the next session will consist in the reading of the papers not only in London, but in the various provincial centres in which a demand appears to exist, and where the subjects of the papers are connected with local industries.

How Long Will it Last?

The other day we set out for London on a 1914 3½ h.p. Humber and sidecar with Armstrong three-speed gear. The engine and gear were in good condition, but the sidecar was shabby, and the machine by no means a new one. We made a good run to the county town, six miles away, where, noticing that the lubricator was not working, we stopped at a garage kept by a well-known motor cycle rider to have it cleared. While attention was being paid to it, we mentioned the fact that we were taking the machine up to London to be sold, and stated that the price was £50. After a short trial run by the proprietor, the money was paid and we completed the journey by train.

The sidecar chassis put to good use by a sculling enthusiast who uses it for taking his skiff down to the water.

Major Dixon-Spain, the newly-appointed assistant secretary of the A.C.U.

The A.C.U. Six Days Trial.

It has been practically decided that the venue of the Six Days trial this year will be Llandrindod Wells, and the dates from September 15th to 20th.

The London-Edinburgh Run.

The M.C.C. is greatly in need of voluntary helpers at the Grantham check, at which the first competitor is due at 2.58 on the morning of Saturday, June 7th. Those willing to assist should communicate with Sec.-Lt. W. Cooper, R.A.S.C., M.T., Clayton, Suffolk.

The Arbutnot Trophy.

The rules and regulations for the Arbutnot trophy event are nearly complete, and will be announced shortly. It will be in the nature of a two days' trial on July 4th and 5th, and will be open to officers and ex-officers of the Royal Navy. The start and finish will be at Plymouth, and the winner will be found by sending the competitors up a certain test-hill. On each day the first ascent will be at a slow speed, and the second at a high speed. The competitor whose average difference is greatest will be accounted the winner, the test being one of consistent running throughout.

Petrol Reduced—Good News for Motor Cyclists.

On Monday last, the 19th inst., reduced charges for fuel were announced by the Shell Marketing Co., Ltd., as follows:

	Per gallon.
Shell motor spirit	... 2s. 8d.
Flag motor spirit	... 2s. 6d.
Crown motor spirit	... 2s. 6d.
Benzole motor spirit	... 2s. 4d.

The reduction was not altogether unexpected by our readers, as, in the issue of the 8th inst., the following paragraph appeared:

"This month motor cyclists may confidently expect a tardy, though none the less welcome, reduction in the price of petrol."

Levis Cup Trial.

As the premier award in the Sutton Coldfield A.C. trial last Saturday was presented by Mr. W. H. Butterfield, managing director of the firm making Levis motor cycles, no Levis machines were entered by riders connected with the firm.

The R.A.E.M.C.C.

A motor cycle club has been founded in connection with the Royal Aircraft Establishment at South Farnborough, and has a membership of approximately 100. The first run will be to the Hut Hotel, Wisley, on Sunday afternoon, June 1st. The secretary is Mr. T. P. Mears, O9 Department, Royal Aircraft Establishment, South Farnborough.

The 1919 N.U.T.

The N.U.T. Co. is moving into larger works, but preparations for the output of the 1919 model are now well in hand. The new machine, which has been subjected to several thousand miles testing, is fitted with a $3\frac{1}{2}$ h.p. V twin, made exclusively for the N.U.T. by the J.A.P. Co. from the design of Mr. Hugh Mason. The cylinders are 64.5 mm. x 76 mm., and the machine is intended for solo use only. Chain-cum belt transmission, with a Sturmey-Archer gear box, is adopted, the chain being entirely enclosed in an aluminium case. With 26in. x 2 $\frac{1}{2}$ in. Palmer Cord tyres, the saddle height is 29in.

Coventry and Warwickshire Motor Club.

The Club Competition for the Manville Cup, a trophy valued fifty guineas, presented by Mr. Edward Manville, M.P., president of the club, will be held on Saturday next, May 24th. The starting and finishing point is Davenport Road, Coventry, and the trial will be held over a route of just over eighty-one miles. The event will be non-stop, except for

the tea interval of one hour at the top of Edge Hill. A starting and stopping test will be made on Sunrising. Thirty-six entries have been obtained, which are sub-divided into the following classes:

MOTOR CYCLES.—Up to 350 c.c. Up to 550 c.c. Up to 1,000 c.c.

SIDECARS.—Single cylinders. Multi cylinders.

CARS.—Up to 1,500 c.c. Over 1,500 c.c.

Motor Cycles for Discharged Soldiers.

It has been known for a long time that we have been in sympathy with any scheme which would enable discharged soldiers to purchase surplus Government motor cycles at a reasonable figure. The A.C.U. is also in sympathy, and has been in communication with the Surplus Government Property Disposal Board with a view to persuading them to adopt some scheme which would enable ex-D.R.'s and other discharged soldiers either to purchase their old machines or other Government motor cycles at a reasonable price.

The Disposal Board has replied to the effect that it has not been found possible to grant preferential treatment to ex-service men, and that the object of the Board is to sell at the highest possible price so as to relieve the tax-payer.

To a letter from a correspondent who recently approached the Controller on this subject, a reply was made to the effect that the Department is prepared to sell motor bicycles by private treaty at full market price to any approved organisation interested in the welfare of discharged soldiers, which is willing to undertake the responsibility for disposing of such vehicles to ex-service men on a scheme of deferred payments.

This sounds very nice, but, unfortunately, no such organisation exists so far as we know, which will undertake the business of buying motor bicycles and selling them on the deferred payment system.

Mr. Claude Grahame-White and Captain Robertson aboard a $1\frac{1}{2}$ h.p. Buckboard, which is propelled by an Auto-wheel. Mr. Grahame-White states that he is making preparations to produce these little machines with an output of 1,000 per week.

BIRMINGHAM-LLANGOLLEN AND BACK.

Week-end Touring Trial of the Birmingham M.C.C. 34 Survivors of the 41 Competitors.

Over forty members of the Birmingham M.C.C. started in the club's two days' trial to Llangollen and back last week-end. A scene at the start.

FORTY-ONE competitors started in the above trial on Saturday afternoon, and thirty-four of them had arrived back at the finishing point near Streety at 9.10 the following evening.

Starting from Duke's Garage, Birchfield Road, at 2.30 p.m., the competitors were guided by route cards via time checks at the Bradford Arms, Shrewsbury, and Llangollen, a distance of 75½ miles.

After breakfast on Sunday morning several competitors, in company with the Liverpool contingent who assisted in the checking, tried their luck on Altj Bady, the local *pièce de résistance*. There were more failures than successes, as may be imagined in view of its precipitous nature.

G. Kuhn, on his Victory Levis, and A. G. Bostock on a 2½ h.p. A.J.S., made clean ascents, and Kershaw (2½ h.p. New Imperial) got up with foot assistance. These were the only successful soloists, whilst sidecar honours fell to Rex Mundy, who, with Lt. H. R. Davies, had ridden up to Llangollen during the night, after competing in Saturday's Levis cup event.

The return trip, which measured 80½ miles, included two observed hills. The leader left at 3 p.m. on Sunday, the remainder following at minute intervals. Harley Bank, Wenlock, and Jockey Bank, Ironbridge, were no real test of the machines.

The weather was fine throughout, ren-

dering the dust rather trying, and, as usual, punctures were frequent. One or two finished with flat tyres.

The survivors of the trial and the machines they rode are as follows:

G. Kuhn (Levis)
E. H. Weaver (Venus)
E. R. Troward (Metro-Tylor)
B. Kershaw (2½ New Imperial)
P. S. Taylor (New Imperial)
W. A. Bown (Bown-Villiers)
L. Newey (3½ Ariel sc.)
C. Oerton (—)
W. E. Emery (Rudge Multi sc.)
M. G. Silver (Quadrant)
F. T. Hill (twin James sc.)
W. C. Treen (James sc.)
T. F. Watson (Norton)
W. H. Edwards (6 twin James sc.)
A. H. Edwards (James)
E. Kibble (Triumph)
E. Danks (James sc.)
H. P. Cutler (Norton sc.)
J. Allday (4¼ single-gear James)
S. Rodway (twin A.J.S. sc.)
L. Baker (B.S.A. sc.)
T. Pollock (twin James sc.)
G. R. Morgan (Triumph sc.)
H. H. Saddington (James)
C. L. Whitley (Triumph)
A. Woodfield (Clyno sc.)
H. J. Stretton Ward (Triumph)
J. F. Lidstone (twin James)
G. H. Dalby (Triumph)
H. Phillips (twin James sc.)
B. L. Bird (B.S.A. sc.)
E. Sherriff (James sc.)
R. W. Vaughan (7 Harley-Davidson sc.)
L. Clarke (twin James sc.)

Observations.

Lt. Treen, R.A.F., rode from Brown-hills with a flat front tyre. Nothing to what he has gone through as an observer, for he wore three wound stripes and several decorations.

W. H. Edwards, who rode one of the new big twin James sidecar outfits, carried a passenger on the carrier throughout.

P. S. Taylor, thanks to his spring frame New Imperial, was able to finish the last ten miles on a flat back tyre. He was thus able to keep on time throughout.

J. Allday had out for the first time a 4¼ h.p. single-gear James, found no difficulty in climbing the hills; and was delighted with the smoothness of the all belt drive.

Scenes during the Birmingham M.C.C. Two Days Trial. (Left) Cutler (Norton) timing in at Llangollen. (Right) A rider of a Quadrant (with Mr. T. Silver as passenger) signing at the finish of first day's run

THE LEVIS CUP TRIAL.

Sutton Coldfield A.C. holds Sporting Half-day Event.

THE Sutton Coldfield and Mid-Warwickshire Automobile Club usually opens the competition "season" with the Colmore Cup trial, which, before the war, probably attracted more entrants than any reliability trial organised by a motor cycle club. This year, however, the manufacturers were not ready for a Colmore Cup trial in February or March—and perhaps the Sutton Coldfield Club was not ready to organise it—so to mark the opening of activities, they held an opening half-day trial over a thirty-seven miles course, which proved to be a sporting event. There were two observed hills—both in the same non-stop section—and the two features of the trial were route finding and speed judging.

The course was not marked in any way, neither did the route cards mention any place by name nor give any distances. Competitors did not know whether the course was forty or sixty miles. They were provided with a direction card which they had to follow at 18½ m.p.h., and speedometers were barred; so, altogether,

The machine on which H. Greaves won the Levis Cup—a Calthorpe fitted with the new 350 c.c. Precision two-stroke engine.

the Levis Works, Stechford, including the following well-known competition riders: T. Stevens (James), W. L. Guy (Scott), the last winner of the Levis Cup, F. A. Watson (Sunbeam), Rex Mundy (Matchless), H. Greaves (Calthorpe-Precision), H. O. Wood, the Scott T.T. winner, and A. Milner (Diamond).

The following are the awards:

1.—LEVIS CUP AND GOLD MEDAL.

H. Greaves (350 c.c. Calthorpe-Precision two-stroke). Time error of 1m. 7½s.

2.—CLUB GOLD MEDAL.

A. Milner (2½ Diamond-Jap). Time error of 1m. 15½s.

3.—CLUB SILVER MEDAL.

Seymour Smith (2¼ Ivy two-stroke). Time error of 2m. 28½s.

SILVER SOUVENIR PRIZES.

H. R. Lane (4¼ B.S.A.), A. W. Thrush (4 Triumph), T. Stevens (4¼ James sc.), R. E. Walker (2½ Excelsior), W. L. Guy (3¼ Scott), B. H. Norris (4¼ B.S.A. sc.), F. A. Watson (3½ Sunbeam sc.), J. N. Roberts (2¼ Douglas), P. G. Dallison (3¼ Ivy-Precision), S. W. Sparkes (3½ Rudge Multi), Rex Mundy (7 Matchless sc.), and H. J. Edwards-Cox (4¼ Sunbeam sc.)

RETIRED.

F. R. Hovard (2½ Allon) and H. O. Wood (3¼ Scott).

The greatest time error was 17m. 13½s. Rex Mundy was fourth with 3m. 1½s.

The winner of the Levis Cup, H. Greaves (Calthorpe-Precision), ascending the observed hill.

to the competitors, it was a most sporting event, and by no means could the speed judging be termed speed guessing, since they had to average the speed mentioned over the whole of the course.

Although rough and in narrow lanes, the observed hills were not sufficiently severe to eliminate any of the competitors. In fact, every starter except two finished without loss of marks.

The gradient of the most severe hill may be judged by the fact that the lightweights only resorted to their second gears on the rough portion near the top, and the 3½ h.p. sidecars successfully negotiated the ascent on middle gear.

Mr. W. Hughes Butterfield, the donor of the cup, organised the trial, and eighteen competitors were sent off from

Scene after the finish of the Levis Cup Trial on Saturday.

Woolwich, Plumstead, and District M.C.

The Matchless Cup trial has been postponed owing to unavoidable circumstances and will be held later in the year.

Ballymena and District M.C.C.

Competitions arranged by this club include speed-judging, reliability, and petrol consumption trials, with possibly a hill-climb. Social runs round interesting parts of the country are also included.

Bristol M.C.C.

A special general meeting was held recently at the Grand Hotel, Bristol, when many new members were elected. Capt. Philip Grout was elected captain of the club, and a working committee of ten was also elected. It was decided to hold a tourist competition (for members only) at Whitsuntide to Land's End, competitors starting from Bristol on Whit-Saturday and returning on Whit-Monday.

Wolverhampton M.C.C.

The reliability trial held on the 10th inst. over a route comprising Bridgnorth, Farlow, Whitley, Stourport, and Kidderminster resulted as follows:

- 1 (Corke Silver Cup and gold medal), H. J. Stretton Ward (4 Triumph).
- 2 (silver medal), A. J. Stevens (6 A.J.S. three-wheeler).
- 3 (bronze medal), Lt. A. Milner (2½ Diamond).

New Glasgow Club.

A social club for Glasgow motor cyclists has been suggested for some time, and such a club has now been formed under the title of "The Garage Club." Club rooms have been opened by Messrs. Bell Bros., at 250, Great Western Road, who have also undertaken to fit up and decorate the premises.

It was proposed to run social and competitive fixtures. The following office bearers were elected: President, Mr. Wm. Simpson; vice-president, Mr. J. Barclay; captain, Mr. J. Connel; vice-captain, Mr. R. Runnell; hon. secretary, Mr. J. Robinson; treasurer, Mr. H. Macdonald; committee, Messrs. D. S. Anderson, N. Laurence, J. Bell, J. Mackie, and E. N. White.

Taunton and District M.C.C.

After four years of enforced suspension this old club was resuscitated at a general meeting held at headquarters—Clarke's Hotel—on Friday last. There was a good attendance of members, and everything points to a most successful season.

Col. Dennis F. Boles, M.P., was again elected president, a position he has held since the club's formation. Mr. W. G. Potter was re-elected captain. Mr. H. T. Kite deputy captain, Mr. W. E. Maynard treasurer, and Mr. Stuart Goodman, Little Court, Taunton, hon. secretary.

The opening run is to Sidmouth on Thursday, 29th May, leaving headquarters at 2 p.m.

Future Events.

- May 24.—Coventry and Warwickshire M.C. Manville Cup Trial.
 May 24.—Birmingham M.C.C. Social Run.
 May 24.—Glasgow M.C.C. Hill-climb.
 May 24.—Oldham and District M.C. Reliability Trial, Heyden Bridge.
 May 24.—Sheffield and Hallamshire M.C.C. Competition for Dickenson and Darwen Cup.
 May 24.—N.M.C.F.U., Leeds. Run to Dunsforth.
 May 24.—Exeter and District M.C.C. Opening Run.
 May 25.—Eastern Counties M.C. Run to Newlands Corner.
 May 25.—Ilkeston and District M.C.C. Run to Quorn.
 May 25.—Liverpool M.C. Social Run to Blackpool.
 May 25.—North Derbyshire M.C.C. Run to Edwinstowe.
 May 25.—Rochester, Chatham, and District M.C. Run to Margate.
 May 25.—S. Birmingham M.C.C. Run to Bromyard.
 May 25.—N.M.C.F.U., Sheffield. Run to Glossop.
 May 25.—Manchester M.C. Reliability Trial.
 May 25.—Wolverhampton M.C. Run to Holt Fleet.
 May 25.—Widnes M.C.C. Run to Rugh.
 May 25.—Ballymena and District M.C.C. Benzole Consumption Trial.
 May 25.—N.M.C.F.U., Leeds. Picnic Run to Nunmonkton.
 May 28.—York and District M.C. Run to Bolton Abbey.
 May 29.—Taunton and District M.C.C. Opening Run to Sidmouth.
 May 31.—N.M.C.F.U., Sheffield. Run to Edwinstowe.
 June 1.—S. Birmingham M.C.C. Reliability Trial.
 June 1.—Harrowgate and District M.C. Reliability Trial.
 June 6.—Essex Motor Club. Midnight Ride to Yarmouth.
 June 6.—M.C.C. London-Edinburgh Run.
 June 7.—Birmingham M.C.C. Trial to Land's End.
 June 9.—Cork and District M.C.C. Twenty-hour Reliability Trial.
 June 9.—Liverpool M.C. Open Reliability Trial.
 June 25.—Essex Motor Club. Speed Trials at Southend.
 June 28.—Midland C. and A.C. Reliability Trial.
 September.—A.C.U. Six Days Reliability Trials.

Worcester and District M.C.C.

It has been proposed by a few motor cyclists in this district to form a club in Worcester. All interested in the pastime are invited to attend a meeting for that purpose at the Grandstand Hotel, Worcester, to-morrow, Friday, the 23rd, at 7.30 p.m., or to communicate with Mr. C. E. Tysoe, 38, Droitwich Road, Worcester.

Glasgow M.C.C.

This club will hold a hill-climb at Inverberg on Saturday next, at which there will be five classes. (1) under 350 c.c., (2) 350-600 c.c., (3) exceeding 600 c.c., (4) sidecars under 600 c.c., and (5) sidecars exceeding 600 c.c. A prize will be awarded to the winner in each class (provided there are six entries). The hon. secretary of the club is Mr. W. J. Turpin, 26, Wilson Street, Glasgow.

Swinton and District M.C.C.

This club, which was formed with the earnest desire of fostering the pastime of motor cycling in the Swinton district by promoting social outings and club sports competitions, has developed with encouraging rapidity. The president is Viscount Mountmorres, Vicar of Swinton.

A copy of the rules, together with the programme of runs, can be obtained on application to the hon. sec., Mr. L. H. Harris, 15, Kersal Avenue, Pendlebury.

Ripon M.C.C.

The Ripon Motor Cycle Club has been restarted. A general meeting was held in Ripon recently at which fourteen new members were elected. The hon. secretary of the club is Mr. James Douglas.

Stalybridge and District M.C.C.

A motor cycle club has been formed for motor cyclists residing in Stalybridge and the surrounding districts, the object of which is to promote social runs and competitions. Local motor cyclists should communicate with Mr. T. H. Mills, Wood Lea, Stalybridge.

Hartlepool M.C.

The Hartlepool M.C. is making a strong appeal to motor cyclists and car owners to join the club, and has issued a compelling circular which details the advantages of so doing. Motor cyclists in the Hartlepool district should write for a copy of this to the hon. secretary, Mr. W. T. Walton, jun., 21, Scarborough Street, Hartlepool.

Scarborough and District M.C.

An effort is being made to revive the Scarborough and District Motor Club, and motor cyclists or car owners in the district are invited to communicate with either Mr. John D. Fell, 57, Gladstone Street, Scarborough, or Capt. H. L. Waddington, R.A.F., 51, Valley Road, Scarborough.

North Birmingham M.C.

The committee will meet shortly to discuss future competitions and social runs. The first event, probably, will be a reliability trial for the silver cup presented by the distributors of Shell motor spirit. Prospective members of this club are invited to communicate with the hon. secretary, Mr. A. W. Thrush, 34, Reservoir Road, Erdington.

Sid Vale M.C. and L.C.C.

There was a good response to the invitation sent out to motor cyclists to start a motor club in Sidmouth. About twenty met at the Y.M.C.A. rooms. Councillor J. Lashbrook was unanimously elected chairman, Mr. Owen Ford secretary, and Mr. Thomanson, Lloyds Bank, treasurer, with the following as a committee: Rev. —, Griffiths, Messrs. Pickson, Martin, Arnold, Wilson, Oliver, and Mortimer.

Sale and Altrincham M.C.

A new club for the southern suburbs of Manchester has just been formed under the above title. The club subscription is 10s. 6d. for motor cyclists and 15s. for car members. The officers elected are all well-known and enthusiastic motorists, and a strong committee has been formed. Those desirous of joining who use the Cheshire roads should apply to the hon. secretary, Mr. F. Stanley Booth, Holme Lea, Mornington Road, Sale, or the assistant hon. secretary, Mr. J. T. Ward, Arran Avenue, Sale.

The New Spring Frame Matchless.

A Peace Model
which has Many
Novel Features.

The new 8 h.p. Matchless will have the rear portion of the frame suspended on coil springs

SINCE early in 1915 Messrs. H. Collier and Sons have been experimenting with spring frames for motor cycles, and no doubt, but for the war, a spring frame Matchless would have been offered to the public in 1916. In 1915 we described a flat twin Matchless which embodied a spring frame with coil springs, and the new Model H, as the Peace model is called, has a springing device which is a modified design of that fitted to the flat twin, and gives an excep-

tionally large movement to the rear wheel. As will be seen from the accompanying illustration, the springing system differs in many respects from others embodying coil springs, which are carried at the outer corners of two triangular members rigid with the frame. The wheel fork is pivoted at its inner end, and a substantial loop passes vertically over the wheel, having at its lower end lugs for carrying the springs.

We shall shortly describe this new

model more fully; in the meantime it suffices to say that the design embodies more features not apparent from the photograph. One of these is an ingenious arrangement of linking both driving and sidcar wheels. This synchronises the movements of both wheels, and prevents the driving wheel from leaning when turning corners.

Other features include an automatic exhaust valve lifter connected to the starting pedal, and interchangeable wheels.

THE GRAHAME-WHITE SALE.

AMONGST the various lots offered for sale last week by the Grahame-White Aviation Co., Ltd., were several motor cycles. A Royal Enfield sidcar was purchased for £125, and was only exceeded in price by a brand new 8 h.p. New Imperial-Jap sidcar outfit, which was sold for £145.

A 4 h.p. Douglas sidcar outfit (Army pattern) was knocked down for £104.

With the exception of a 1912 $3\frac{1}{2}$ h.p. Humber motor cycle and Chater-Lea cane sidcar, which realised £55, the remaining machines were solo mounts. Of these a $2\frac{1}{2}$ h.p. Rex fetched £16 and a 1911 $2\frac{3}{4}$ h.p. Kerry went for £15.

(Top) A 4 h.p. Douglas
sold for £90.

(Left) £145 was the price
paid for this New Imperial
outfit, which was quite new.

(Right) This $2\frac{1}{2}$ h.p. Rex,
of very early date, realised
£16.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

BENZOLE AND TANKS.

Sir,—As many readers, like myself, are using benzole, they will find that, by giving their tanks a coat of Shellac varnish (obtained at almost any oil and colour merchant), the benzole will not soften or affect the enamel in any way. It is a spirit varnish, dries quickly, and with a bright, hard finish. My tank has been treated with it for over four months and is still in perfect condition.

King's Heath.

EXCELSIOR.

AUCTION SALE OF CANADIAN MOTOR CYCLES.

Sir,—We have noticed that, not only the catalogue, but the press, states that the Indian motor cycles sold at the British Motor Cab Co.'s Depot, Brixton Road, on the 5th inst., were 1916 models. This is an error. The machines in question were 1914-15 models, and entirely different from the 1916 Powerpius.

We should appreciate it very much if you would give publicity to this letter, as we consider it is only right that purchasers of these machines should know exactly what models they have purchased.

HENDEE MANUFACTURING CO.,
W. H. WELLS, Manager.

THE LYCETT TROPHY.

Sir,—Although the Birmingham M.C.C. has issued preliminary regulations for the Lycett Trophy, which have been published in your valuable paper, the committee has been continually up against the usual stumbling-block when a premier award is up for competition, namely, finding the winner which will eliminate the element of luck. Although rather late, a special meeting was called to go thoroughly into the matter, and, after much discussion, in which all the suggestions put forward had their weak points, it was decided to award the Lycett Trophy as follows:

The Lycett Trophy will be awarded to the competitor who makes a perfect performance. That is, not more than two minutes early or late at each time check and climbs the observed hill. If more than one competitor qualifies, they will be bracketed equal trophy winners and each awarded a silver replica in miniature of the Lycett Trophy. Although this does not actually pick out the winner, I think you will agree it is a move in the right direction, as it gives to each who has made an equal performance an equal award, as all those who are within the four minutes margin are considered to have made an equal performance on time.

W. H. EGGINTON, Hon. Sec.

NORTH WALES ROADS.

Sir,—I read with interest in *The Motor Cycle* of May 1st suggestions as to a route to North Wales. I happen to have just completed the journey myself. My route was Slough, Maidenhead, Henley-on-Thames, Oxford, Woodstock, Chip-ping Norton, Evesham, Worcester, Kidderminster, Bridg-north, Much Wenlock, Shrewsbury, Llangollen, Corwen, Bala, and Dolgelly. I spent one night at Oxford with some friends. I avoided all big centres such as Birmingham, and met with nothing big in the way of hills. The roads round Hounslow are bad, but otherwise I found them good; there is another bad bit before reaching Shrewsbury. In Shrewsbury, on signalling for a turn to the right, in order to follow the pointer "to Holyhead," I was made to go straight on by the police. There was no other pointer, so I took the first turn to the right down a narrow back street which landed me out at the bridge on the north side of the town.

I think the pointer where the policeman would not let me go might quite well be removed to this street. Between Llangollen and Corwen there was one bad piece of unrolled stones. I took the valley road from Corwen to Bala, which was good. The roads in Merioneth are in a shocking condition owing to much traction traffic in log hauling. Very little seems to be done to mend them beyond throwing down large stones. The Dolgelly-Festiniog road in particular should be avoided.

C. T. A. BEEVOR.

SINGLE-SPEED AND FOUR CYLINDERS.

Sir,—There has been a lot said recently *re* the single-speed "big single" as a sporting 'bus, but very little has been said about the four-cylinder single-speed machine.

The single must always be the simplest and most reliable type of engine, but the 5-6 h.p. F.N. and the 7-9 h.p. Henderson have both proved to be reliable machines if properly looked after.

The following is my ideal specification:

FRAME.—Sprung front and rear *à la* Indian.

ENGINE.—Four-cylinder 7-9 h.p., o.h.v., air-cooled.

TANK.—Wide at the front, tapering to the rear, to hold two and a quarter gallons of petrol and half a gallon of oil.

LUBRICATION.—Drip feed with auxiliary hand pump.

CARBURETTER.—Two-lever variable jet.

TRANSMISSION, ETC.—Shaft drive. Combined lighting and ignition generator, behind the engine, close to the tank. Semi-T.T. handle-bars with Pedley grips.

A machine such as this would satisfy any ordinary desire for speed, and would be easy to manage in traffic, as when the engine is warm a slight push will start it, and if all is in order it will fire regularly at 3 m.p.h.

FOUR CYLINDERS.

REPAIR JOBS.

Sir,—*"Ixon"* is quite right in what he says, but the trouble, again, is that firms require the cash first, and do not always fulfil their contracts. This has happened to me twice. What is to be done then? Also they do not keep anywhere near the time stated, which is a great annoyance.

On the other hand, I had the following repairs to my engine (a 1916 J.A.P. 5 h.p. twin): Completely dismantled and cleaned, rebored crank case and fitted special bush, connecting rods straightened, new baffles, rockers hardened and ground, two new gudgeon pin bushes, big end bush, crank pin, two spindles, cone for gear and balls, inlet pipe nut, piston and rings and gudgeon pin, piston ring valve cap and washer, three valve guides, four valve springs, odd washers and bolts, valves ground in, and whole engine assembled with a new cylinder.

Spare parts	£4 12 3
Plus 45%	2 1 2
Labour	3 6 0

Total £9 19 5

What could be more reasonable, and, moreover, it was done to time. Also, now I have had some dealings with the firm, they do not hold up spare parts for the cash, but despatch them promptly.

I should wish here to thank Zenith Motors for the way they treat their customers.

Should other readers be willing, I should like to give and hear of the firms who do not give satisfaction, and see their names printed in your paper.

G.B.A.

A GOOD CLIMBER.

Sir,—The performance of my "Big Four" Norton is, I think, worthy of the notice of your readers.

With a Norton coachbuilt sidecar, myself and passenger (each weighing fourteen stone), petrol and spares, it climbed the well-known Porlock Hill, near Minehead, without any effort or stunt riding. This outfit is just an ordinary standard "Big Four" single-cylinder Norton, and can pass heavy twins quite easily.

I have used this combination for four years, and am still running on the original Dunlop heavy tread 26×3 oversize tyres—an excellent feature of the Norton outfits.

I should like also to say that the Norton people have always been courteous and prompt in despatching spares.

Bedminster, Bristol.

B.J.

AN EXTRA SPARK.

Sir,—The cause of a peculiar firing back into the carburettor of my brother's machine baffled us for many days, and as we thought the matter rather strange, I have written to you so that perhaps some other motor cyclists might benefit from the explanation.

Much intermittent firing after one big pop in the carburettor made us think that premature ignition was caused, and we were led to believe that the Bosch magneto was giving two sparks. This turned out to be the case. The contact breaker casing was worn rather on the end boss of the magneto. So much so, that the points of the breaker varied in distance apart as they moved round. This was due to the eccentricity of the casing and the contact breaker, which caused the points to touch again and break a second time towards the end of the cam piece, thus causing a second spark at the plug points and somewhere near the beginning of the suction stroke. Hence the explosion when the valve was open and the intermittent firing.

A new contact breaker casing and end plate put matters right immediately. The trouble may not be new to you, but it struck us all as being most novel.

P. BOWLEY.

AVERAGE SPEEDS.

Sir,—Just to show that it is possible for a girl motor cyclist to be interested in another part of motor cycling besides the clothes to be worn, may I comment on the letter from Mr. Stuart in the April 24th issue?

I was pleased to see something sensible written on the subject of averages. I did not see Mr. Varney's letter, but the idea of his two-stroke averaging 35 m.p.h. with a sidecar and 45 m.p.h. without puts my head in a whirl. I have ridden a Lewis and an Allon, and always thought they were doing well if they touched 35 m.p.h. solo. I should have called 20-25 a good average on a long run.

I have what I consider an excellent 2½ h.p. Douglas, Colonial model, and have never done more than 46 m.p.h. on the level. My best average was from Bromley to Birchington (seventy miles odd) at 27 m.p.h. exactly. To do this I was riding at 35 m.p.h. most of the way, and for several stretches of good road at 38 m.p.h. I only beat this run by five minutes a week later on a 4½ h.p. Bat, which seems to show that, taking cross roads and villages into consideration, one cannot comfortably, in the interests of one's own safety and that of other people, do much more than average 27 m.p.h. I have a Bonniksen speedometer.

I read your paper with interest, as I am a very keen, though ignorant, motor cyclist.

(Miss) E. MANVELL.

GUESSING COMPETITIONS.

Sir,—To determine reliability by speed guessing is nothing short of ridiculous, and may, at some time or other, open the way to fraudulent practice in order to obtain the premier award.

In the Victory Cup trial there were many riders who qualified for the guessing competition, i.e., secured highest possible marks for reliability, but their mounts were in effect designated less reliable than those fortunately placed machines whose drivers had the good luck to estimate speed more closely. The result is that there can be no real pride of ownership, because possession signifies nothing meritorious, and, consequently, a very excellent and remarkable performance loses the appreciation it deserves.

In spite of the splendid management and organisation of the Victory Cup trial, and the hard and voluntary work of the officials, it has ended unsatisfactorily, as so many similar

trials are bound to do if reliability is determined by a man's ability to ride to a timetable, his knowledge of the exact position of a check, or his ability in speed-judging.

It would save a deal of trouble if the qualifying riders' numbers were put in a hat and a draw arranged for the premier award. This should be more satisfactory to the sporting fraternity, and would be just as efficient a test of reliability as the method in question.

In the coming Birmingham-Land's End and back trial of the Birmingham Club for the Lycett trophy, some other method than timetable riding is wanted, and I have no doubt the officials of the club would hail with delight any suggestion that would assist in this respect. The Birmingham Club is not alone in its desires in this direction. Acceleration, fast and slow hill-climb, petrol consumption, stopping and restarting on hills, etc., are admirable, provided a satisfactory formula and the necessary numerous officials can be found.

JAS. L. NORTON.

HONOUR TO WHOM HONOUR —

Sir,—I read with sympathy the experience of "The Learner" in your issue of April 17th, and cannot help thinking that more publicity might be given to us fortunate ones who have been treated generously by the trade. Some two months ago I was on the look-out for a second-hand sidecar machine. From previous experience I knew that I ran risks, but unfortunately my purse would not allow of a new machine. I saw the mount I wanted at Messrs. Selfridges—a 4 h.p. Calthorpe-Jap and sidecar. I explained at the time that I could not afford to be continually putting my hand in my pocket for repairs. After a short trial the machine did not come up to my expectations. As soon as I explained matters to Messrs. Selfridge they promptly gave me a free hand to have the machine thoroughly overhauled at their expense at any repairers I might choose. In your advertisement columns I saw that Herpin and Sharples, of 47, South Lambeth Road, undertook overhauls. They had my machine three weeks, during which time I visited their shop frequently and saw for myself the excellent work which they put in. These two men were recently aero engine testers in H.M. Forces, and I feel sure that if I had fitted a pair of wings to my machine when they had finished with it I should have flown. I have just returned from a week's holiday without the slightest hitch. I have no interest in either of these two firms other than as a satisfied customer. I wonder if many of your readers have been treated as generously and as well as I.

SATISFIED.

THE FIRST FRENCH
MOTOR SCOOTER.

The model shown, manufactured by M. Blauseur, of Paris, is entirely in the rough, and it is reported that M. Blauseur has made this outfit simply for his own use. The tiny engine is fitted with an overhead mechanically-operated inlet valve, and the drive is by chain to the rear wheel.

ADVANTAGES OF A FOUR-STROKE.

Sir,—I see in your April 17th issue that "Excelsior" wants to know why the majority of people prefer the four-stroke to the two-stroke. I infinitely prefer a four-stroke as a lightweight mount for the following reasons: (1) It is more economical in oil and petrol; (2) it is faster; (3) it does not overheat so easily; (4) it does not use up so many sparking plugs; (5) it carbonises up much less than a two-stroke; and (6) it can sustain speeds of about 35 m.p.h. for quite long periods, whereas if you do that with a two-stroke it gets "tired."

Of course, a two-stroke is a better hill-climber, and is usually rather an easier starter. I once had a New Imperial-Jap that got up to within fifty yards of the top of Birdlip Hill on top gear, and I never had any trouble in starting up with war spirit and 15° of frost.

I think that this compares very favourably with a two-stroke. Though a two-stroke undoubtedly has advantages such as simplicity, lightness, etc., I do not think its advantages anything like outweigh its disadvantages. R.N.

On Active Service.

PULLEY GRIP.

Sir,—With reference to my original letter on this subject, and Mr. R. L. Boyd's letter in your issue of April 3rd, I have not yet seen a ball thrust Grado pulley, as my own is the 1915 model with plain thrust. The wording used by Mr. Boyd does not make it clear on which side of the operating ring the ball thrust is situated; he thinks it ought to be fitted "between the control rod and pulley." Which part of the pulley? He cannot mean the "sliding flange" (i.e., outer flange), as he uses that expression in the next line. However, there is no doubt in my mind that the ball thrust is most needed between the operating ring and the adjustable outer collar. It is also needed to a lesser extent between the operating ring and the outer flange. On my own machine, when the throttle is well open, I find it impossible to lower the gear without momentarily switching off owing to the terrific tendency of the outer flange to close in, which overcomes one's efforts to move the control handle. On the other hand, when running with very little throttle, the pull of the belt is not sufficient to tend to close the flange. In this case the thrust on the operating ring is obviously in the opposite direction, hence the need of two ball thrusts. I found proof of this when I took my pulley to pieces, when I found both sides of the operating ring slightly worn. The lubrication was the difficulty, because grease soon disappeared. Consequently, I fitted a ball race to both sides of the operating ring.

The steel washers made a free sliding fit on the sleeve of the sliding outer flange. By turning down the operating ring to half its original width, room was made on the sleeve for the four washers. This arrangement has given every satisfaction so far, and is quite simple to fit if a lathe is available; the cost is negligible.

I have not used a Whittle belt on the Grado, but my experience with this belt in the past was that it was more inclined to slip than ordinary belts, unless one frequently scraped and dressed the leather: it so soon developed a hard glassy surface in dusty weather. To my mind, there is nothing to beat a Dunlop of generous width, and a Forward fastener (which cannot come unhooked when the belt is running slackly in low gear).

Blackheath.

GRADUATE.

Sir,—I have seen the correspondence in your columns *re* the above and I am in agreement with your correspondent, Mr. R. L. Boyd, that, *re* Grado pulley, the makers' claims are not quite as clear as they might be. During the last four years I have had two machines fitted with this gear, a 2½ h.p. and a 3½ h.p. My experience is that there is very little extra grip on the belt when the belt is slack or in "bottom gear." It is only necessary to try a decent hill to prove his. As soon as the pulley is called upon to do any out-of-the-ordinary work, with the belt slack, the machine commences a series of leap frog jumps and "konks out" with a big effort to jump the moon. On the other hand (and this is my reason for sticking to the Grado) it is an

ideal gear for a solo speed merchant not desirous of out-of-the-ordinary hill climbing. On my 3½ h.p. T.T. model I run the gear at about 4½×1 on top; and with speed up I should take a bit of passing up an ordinary hill or on the level. The pulley is at its best when cornering at speed on an ordinary hill; a touch of the lever brings the machine round without losing revs. The same applies to picking up quickly from a standing start.

Here is a point I cannot understand: it is often claimed as a proof of the pulley's gripping powers that if the control lever were taken away the pulley would run automatically into high gear. Surely this is opposite to the claim that the pulley has a tendency to grip the belt when slipping. If, as is claimed, the outside flange moves inwards when the belt commences to slip, then what really happens is the gear is raised slightly, the movement being equivalent to moving the control lever slightly, but this is not gripping the belt.

Let me say in conclusion that for ordinary solo riding the pulley is, to me, just that much better than a fixed gear that it is not worth the while having a gear box fitted.

Sheffield.

BELT DRIVE.

COURTESY ON THE ROAD.

Sir,—Under the above heading, a letter appears in your issue of May 1st, in which the writer, Mr. C. J. Williams, asks you to put forward an appeal to the newer riders who are just taking up motor cycling to cultivate the old-time courtesy of the road. He quotes an unhappy experience of his, and all who read it must feel sympathy for him. May I, however, give my experience on the road at Easter?

On Good Friday morning I started from Croydon to Eastbourne at a leisurely pace, on my 2½ h.p. Levis. Being unaccustomed to the saddle, I stopped every half hour or so, to stretch myself. On almost every occasion, hardly had I left the saddle, when a sympathetic sidecar would slow down at my side to offer assistance. On one occasion, at Uckfield, the number of offers of help was almost embarrassing, and I quickly continued my journey, thinking gratefully of the fine spirit of comradeship shown by my fellow travellers.

Sanderstead

JOG TROT.

Sir,—I have read Mr. C. J. Williams's letter in *The Motor Cycle* of the 1st inst., and I am sure motor cyclists will agree that many performances such as that of the "gentleman" with the sidecar outfit who damaged Mr. Williams's machine and did not even stop to apologise would do a lot to spoil motor cycling. It seems to me, however, that this is rather an isolated case, at any rate round Kent. I have been out for several runs this year and have experienced two punctures and one "belt break." On each occasion, passing motor cyclists slowed up and asked if they could assist.

The driver of the sidecar outfit in question would do well to follow the example of the Kent motor cyclists, but if he still pursues his mad career, wishing him no harm, I hope the next thing he bumps into is not the rear lamp and mudguard of another motor cycle, but something such as the back wheel of a steam roller.

H. G. WARDEN.

MAPS FOR MOTOR CYCLISTS

"THE MOTOR CYCLE" ROAD MAPS.	Price.	Post free.
1. England & Wales, 2. Scotland, 3. London. (Showing roads into and out of London and avoiding London.) Set of three, complete in case ..	4/6	4/10
"The Autocar" Map of England and Wales. Dissected and folded in neat case cloth ..	12/6	13/-
Also on rollers (a good wall map) ..	12/6	13/-
"The Autocar" Map of Scotland.		
"The Autocar" Map of Ireland. Same styles and prices as above.		
"The Autocar" Sectional Map of England and Wales. Consisting of 24 loose sections on strong card. In stout waterproof envelope .. (complete)	5/-	5/6
In leather case, transparent front ..	15/-	15/6
"The Autocar" Half Inch Map of England and Wales. In 37 sections. Each section ..	3/-	3/2
"The Autocar" Map of South Eastern England. In stout waterproof envelope ..	3/6	3/10
In leather case, transparent front ..	15/-	15/6

Obtainable by post (remittance with order) from
ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4.
or of leading Booksellers and Railway Bookstalls.

Section of a pulley illustrating "Graduate's" remarks

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Removing a Front Wheel Spindle.

I shall be greatly obliged if you will tell me how to take out the front wheel of a 1913 7-9 h.p. Indian. I have thoroughly examined it and tried my best, but without success. The forks seem too rigid to spring apart sufficiently to clear the hub spindle.—J.P.B.

There is absolutely no difficulty in removing the front wheel of an Indian motor bicycle. All you have to do is to remove the two nuts and knock out the spindle with a lead hammer.

Speedometer Repairs.

Can you please inform me where I can get a Stewart speedometer new hair spring fitted for recording mileage per hour? The one I have, I have found out, is broken, and it will not record speed.—E.W.E.

The makers of the Stewart speedometer, Messrs. Cooper-Stewart Engineering Co., Ltd., 11, Broad Street, Bloomsbury, London, W.C., will probably be able to assist you.

Rear Lamp lighted by Magneto.

I desire to light a small glow lamp (for use in rear light) from the primary winding of my E.I.C. magneto fitted to 1915 Alldays-Allon, and should appreciate your assistance on the following points: Necessary alterations to magneto. Wiring up, viz., in series with contact breaker, or shunt on primary circuit. Am I correct in assuming that when an armature is rotated in a permanent magnetic field the voltage will not exceed a certain fixed point, regardless of revolution of armature, and that neither will electrical damage be caused?—SU 480.

(1) We do not recommend the practice of taking a lighting circuit from the primary of a magneto while it is being used for ignition as well, because it is likely both to interfere with the effectiveness of the spark and to give unsatisfactory lighting. The voltage given by the primary windings under these conditions is complicated by the fact of the self-induction of this circuit when the contact breaker opens. If you wish to carry out this scheme the best plan is to get into touch with Messrs. F.R.S. Lamps, Ltd., Birmingham, who make a special set for this purpose with a transformer coil to reduce the voltage to four volts for the lamp. In any case, the wiring for the lighting circuit must be taken off as a shunt circuit. You are right in assuming that when an armature is rotated in a permanent magnetic field the voltage will not exceed a certain fixed

point. The reaction of the armature prevents this being exceeded. This applies to an ordinary armature, but with a magneto where the circuit is periodically interrupted by the contact-breaker the conditions are different.

Use of Benzole.

I am purchasing a new 1919 B.S.A. and would like to give it a trial on benzole. (1.) Do you advocate the use of benzole in new models? (2.) What is your opinion as to using this spirit in a new 1919 4½ h.p. machine? (3.) Does it tend to carbonise more readily than the present poor qualities of petrol? (4.) Is the flash point higher or lower than petrol? (5.) Would a different jet have to be used, or will the usual jet supplied with the B.S.A. machines take benzole the same as petrol? (6.) Can the same speed, power, and economy be effected from benzole as from petrol? (7.) Does benzole cause overheated cylinders more than petrol? (8.) Can a B. and B. carburetter be used with advantage on B.S.A. models?—H.G.W.

(1.) Yes, if a good quality is obtained. (2.) Quite suitable for any machine. (3.) No. (4.) A higher temperature is required for ignition. (5.) No; the jet of the B.S.A. carburetter is adjustable and is suitable

for either. (6.) Slightly less speed, same power, more economy. (7.) No. (8.) Certainly; but the B.S.A. carburetter is quite efficient when properly adjusted.

Repairing a Carburetter Float.

My carburetter floods owing to a small quantity of petrol in the float. How am I to find the leak and remove petrol?—H.D.M.

Heat the float in a saucepan of water. As soon as the water becomes hot, petrol vapour will be observed issuing from the leak, which can thus be located. The quickest way to get the petrol out of the float is to enlarge the leak slightly, and when the float is quite empty the leak may be soldered over.

The Local Taxation Licence.

I had a B.S.A. motor cycle at the beginning of this year. I took out my licence at the post office, for which I paid £1. I sold the machine recently, and now have a two-stroke. The police inform me that my old licence will not do for this machine. Is this right?—ONE IN DOUBT.

The police are absolutely in the wrong. The local taxation licence entitles you to keep one motor bicycle at a time until the said licence expires.

Hill-climbing expeditions are again becoming popular, and all the well-known acclivities are being revisited. The picture shows a party of motor cyclists on Alms Hill, near Henley.

Cylinder Studs.

[?] I am having trouble with my engine, which is a 1910 7-9 h.p. Peugeot fitted with a clutch on the engine-shaft. I find that one of the bolts which holds the cylinder down is stripped, and I should like to know what means can be employed to remove it.—C.G.

The holding-down bolts are screwed into the crank case, and can be unscrewed by means of a footprint spanner. A better method is to screw two nuts on each bolt tightly one against the other, and then unscrew with an ordinary spanner. Unless the thread is too far gone, when the first method must be employed.

Rear Cylinder will not Fire.

[?] After my 5-6 h.p. Indian had been put aside for several months I found that the back cylinder would not fire. After overhauling it, cleaning carburetter, jet, and plugs, also cleaning and adjusting platinum points, cleaning carbon brushes, taking off cylinder heads, clearing carbon deposit from them, grinding in all valves, inspecting leads to plugs, replacing everything carefully and seeing that all joints are tight, I still find that the back cylinder will not fire. Will you tell me how to find the trouble?—H.J.K.

First of all, see that the magneto is sparking properly and that the current is reaching the back cylinder, then try changing the plug, and finally see that there are no air leaks at the induction pipe or carburetter unions to this cylinder, and that the inlet valve is working properly.

The Rudge Clutch.

[?] (1.) You were good enough to help me with advice before concerning the Rudge Multi clutch. Will you kindly do so again? I have taken the clutch down, cleaned carbonised oil off the projections on the plates, of which, by the way, I found fifty-one; removed the odd plate, raised and lowered the tension of the spring, tried removing another plate, and made various adjustments of the outer cone, and still the clutch engages so fiercely that there is a distinct bark or scream when it is engaged, and the engine stops. The machine has plenty of power when started with the clutch in, and I am at a loss to know what to do now. What would you suggest? (2.) Would you mind giving me some idea of how the plates in this form of clutch engage and disengage?—J.F.G.

(1.) The correct number of plates in the clutch should be fifty. If you have taken the clutch apart, cleaned it, and have omitted to clean all the holes in the main-shaft through which the lubricating oil reaches the clutch, your work has been in vain, and want of lubrication may cause the trouble. If you followed the instructions in the Rudge booklet, and everything is in order and the plates are not excessively worn, there is no reason why the clutch should not be satisfactory. (2.) The spring presses the plates together and locks them up solidly, so that the clutch should take the drive. When the pressure is taken off the plates separate, and the clutch is then free.

Broken Contact Breaker Springs.

[?] Will you please tell me, or suggest any reason why, when riding a 2½ h.p. Douglas, with a Bosch ZA2 magneto fitted, four contact breaker springs should break in four weeks, three of them in the last week? The machine runs well for about ten miles after fitting a new spring. The magneto is oiled according to instructions, and seems quite clean.—A.D.F.-R.

The trouble is probably due to the contact breaker springs being over-hardened.

Low-tension Magnetos.

[?] Please give me some information regarding low-tension magnetos. I have a motor cycle and have no idea of the ignition method employed, and fail to get any spark from the magneto. Also, how do the plugs work?—CONSTANT READER.

There are two types of low-tension magneto used on motor cycles. The first, a very early type, consisted of the magneto producing a low-tension current and was fitted with an oscillating armature. The cylinder was provided with a mechanical make and break. This type was soon superseded, and the next development of the magneto consisted in the production of the Eisemann, which was a rotary magneto developing a low-tension current raised to a high-tension one by means of a coil carried in a compartment of the tank. If by plugs you mean the mechanical make and break inside the cylinder the action is as follows: On the current being generated from the magneto the circuit is broken automatically inside the cylinder and a violent spark jumps across the gap created. The system is open to the usual defects of the complicated piece of mechanism, and leakage of compression is also possible.

The Silencer Regulations.

[?] I should be grateful for information on the question of the degree of silence required by law in the case of a motor cycle. (1.) Is the fitting of a silencer necessary by law? (2.) Does the law leave the necessary judgment to the policeman? (3.) In the event of a silencer being legally necessary, are baffle plates also essential? (4.) What about the machine with a long exhaust pipe?—G.L.W.L.

(1.) The following is an extract from the Silencer Regulations: "He shall not use any cut-out, fitting, or other apparatus, or device which will allow the exhaust gases from the engine of the motor car to go straight into the atmosphere without first passing through a silencer, expansion chamber, or other contrivance, suitable and sufficient for reducing as far as may reasonably be practicable the noise which would otherwise be caused by the escape of the gases." (2.) Even though a motor bicycle may conform structurally to the regulations, it is left to the policeman to say whether or not it is considered noisy in his opinion. (3.) You will also note that no mention is made of baffle plates. (4.) Here, again, comes the question of noise. It might be quite well argued that a long exhaust pipe is, in itself, an expansion chamber.

READER'S REPLY.**A Loose Bush.**

I had the same trouble as your correspondent "J.P." in your issue of April 17th, and got over the difficulty by making a special bush with collar. I should be pleased to help "J.P." if he cares to communicate with me.—H. A. ROGERS.

[A letter addressed c/o The Editor will be forwarded.]

EXPERIENCES WANTED.

B.H.—Bonnixsen Isochronous speedometer.

RECOMMENDED ROUTES.**NUNEATON TO ABERGAVENNY.—T.E.J.**

Nuneaton, Coventry, Kenilworth, Warwick, Stratford, Evesham, Tewkesbury, Newent, Ross, Monmouth, Abergavenny.

ABERGAVENNY TO BARMOUTH.—T.E.J.

Abergavenny, Hereford, Leominster, Ludlow, Craven Arms, Bishops Castle, Montgomery, Welshpool, Llanfair, Dinas, Mawddwy, Dolgelly, Barmouth.

BARMOUTH TO NUNEATON.—T.E.J.

Same route as above to Welshpool, then Shrewsbury, Wellington, Ketley Bank, turn left to St. George's, and along Watling Street through Crackley Bank, Weston-under-Lizard, Gailey, Muckley Corner, Fazeley, Atherstone, Nuneaton.

WITNEY TO CARDIFF.—S.G.P.

Witney, Burford, Northleach, Cheltenham, Gloucester, and back by the route previously given. Approximately 96 miles.

CANTERBURY TO BATH.—A.J.P.

Canterbury, Chilham, Charing, Maidstone, Leybourn, Igham, Seal, Brasted, Westerham, Limpsfield, Godstone, Reigate, Redhill, Dorking, Gomshall, Guildford, Farnham, Odham, Basingstoke, Whitechurch, Andover, Ludgershall, Up-avon, Devizes, Melksham, Box, Bath.

WILLESDEN TO BARROW-IN-FURNESS.—A.B.

Willesden, Harrow, Rickmansworth, Great Missenden, Aylesbury, Bicester, Banbury, Stratford-on-Avon, Alcester, Headless Cross, Kidderminster, Bridgnorth, Wellington, Hodnet, Whitechurch, Tarporley, Warrington, Wigan, Preston, Lancaster, Carnforth, Milnthorpe, Bowland Bridge, Newby Bridge, Ulverston, Barrow-in-Furness.

**BOURNEMOUTH TO STAMFORD, VIA WEL-
LINGBOROUGH.—J.E.B.**

Bournemouth, Christchurch, Lyndhurst, Cadnam, Winchester, Newbury, Abingdon, Oxford, Bicester, Buckingham, Stony Stratford, Newport Pagnell, Bozeat, Wellingborough, Kettering, Great Weldon, Stamford.

ALTRINCHAM TO MINEHEAD.—A.F.T.L.

Altrincham, Northwich, Tarporley, Whitechurch, Wellington, Bridgnorth, Kidderminster, Worcester, Tewkesbury, Gloucester, Stone, Alverston, Bristol, Axbridge, Highbridge, Bridgwater, Minehead.

MOTOR CYCLES FOR SALE.

Alldays.

ALLDAYS 4-stroke, 5h.p., good running order; £24.—T. W. Shaw, Wellington, Salop. [X1027]
ALLON, 1915, 2-speed, lamps and speedometer, stored 2 years; £35.—14a, Alliance Rd., Plumstead. [1137]

ALLON, late 1916, lamps, Klaxon; 38 gns.; unused 2 years; after 5 p.m.—35, Battersea Rise, S.W.11. [1614]

1916 Alldays Allon, countershaft drive, splendid condition; £45.—Rawlinson, Oxford St., Langdon Hill, Essex. [1338]

ALLDAYS Allon, 1915, 2-stroke, new condition; £39, no offers; after 6.—35, Freegrove Rd., Caledonian Rd., Holloway. [1267]

ALLDAYS Matchless, 2½ h.p., 2-stroke, good condition; trial, examination; £50.—17, Goldhawk Rd., Shepherd's Bush, London. [1280]

ALLON March, 1919, 2½ h.p., 2-stroke, 2-speed, h.p. clutch, P. and H. lamps, Lucas horn, condition as new; £57; after 5 p.m.—14, Ravenscroft Park, Harrow. [1323]

Alp

£25.—Alp lightweight, excellent condition; genuine; stamp for reply.—Advertiser, 8, Hatherley Rd., Reading. [1544]

Alycon.

2½ h.p. Alycon, smart lightweight, B.B. carburettor, 24 Bosch mag., good tyres, good running order; £35.—Davies, 54, Greenfield Rd., South Tottenham. [1211]

American, Ltd.

9 h.p. American, Ltd., free engine, lamps, horn, speedometer, not done 4,000 miles, very fast; £65.—H. Wright, Arlesey, Beds. [1537]

Ariel

ARIEL Combination; £50; not before 7.30 p.m.—50, Mann St., Walworth, S.E. [1447]

CROW Bros., High St., Guildford.—Ariel agents since 1915. 1919 deliveries have begun. [5299]

ARIEL, 3½ h.p., new tyres, very fast machine, in excellent condition; £43; seen after 6.—41, Heath Gardens, Twickenham. [1648]

ARIEL, 3½ h.p. and 6-7 h.p.: early deliveries.—F. Speakman, Ariel Expert, 7, Rochdale Rd., Harpurhey, Manchester. [5269]

ARIEL, 3½ h.p., late 1917, 3-speed countershaft, new, overhauled by makers last week.—134, Claremont Rd., Rugby. [X0843]

ARIEL 1914 3½ h.p., 3-speed gear, clutch, new back tyre, in thorough going order; £45 or nearest.—Laarak, Sunbury, Middlesex. [1458]

ARIEL 3½ h.p., T.T., believed 1913, re-enamelled, tyres and engine perfect, new P. and H. lamp set; £45.—Box L1351, c/o The Motor Cycle. [1678]

Arno.

ARNO Motor Cycle, 3½ h.p., Bosch mag., splendid condition; any trial; £45, or offer.—C. Meade, Elms Bakery, 568, High Rd., Leytonstone. [1330]

4 h.p. Arno, mag., B.B., perfect running order, nearly new tyres, lamps, horn; any trial; £38.—Lawn Dale, Cottrells, Hemel Hempstead, Herts. [1711]

Auto-Wheels

WALL Auto-Wheel, good condition; £7/10.—Melbury, Bushey Heath, Herts. [X1064]

WALL Auto-Wheel, perfect condition; £8/15.—8, Wordsworth Rd., Wallington, Surrey. [1557]

AUTO-WHEEL, B.S.A. de Luxe, mileage 250, as new; 12 gns.; offers.—Cpl. Lawrence, 50, Park St., Cardiff. [1617]

FOR Sale, brand new Smith Auto-wheel, just brought in from America, complete with fittings; what offers?—B., 15, Allyn Park, West Dulwich, London, S.E. [X1038]

Bat.

4 h.p. Bat-Jap, spring frame, B.B., clutch, just overhauled, ride away; £30.—Field, 26, Rowan Rd., Bexley Heath, Kent. [1154]

BAT 9 h.p. Combination, 3-speed, car tyres, handle starter, splendid condition.—A.W., 47, Brondesbury Villas Kilburn, N.W. [1406]

BAT-JAP, 8 h.p. Combination, coachbuilt, 2 speeds, clutch, K.S., spare Dunlop new, all accessories; £70; before 10 a.m., after 5 p.m.—Wills, 9, Ravenstone St., Balham. [1151]

4 h.p. Bat-Jap, 1913, engine just overhauled, new piston fitted, tyres and belt as new, spring frame model, £35; also 6 h.p. Minerva twin, fitted new C.A.V. mag., T.T. handle-bars, 26×2½ tyres, one new S.S., new belt, adjustable pulley, very fast machine, not a creak; any trial; £32.—Ford, jun., North Moreton, near Wallingford, Berks. [X1262]

Blackburne.

CROW Bros., High St., Guildford, are old Blackburne agents, and can give early deliveries. [5300]

BLACKBURNE—Sole agents. Book now for early delivery.—Chandler, Eyre and Williams, Sun St. Hitchin. [0999]

JONES' Garage.—We can accept orders for all models of Blackburne motor cycles; delivery expected in April; deposits optional.—Broadway, Muswell Hill. [0992]

We know

THAT by merely promising deliveries of new machines, we could keep a clerk all day and every day booking orders.

THAT we could take any number of deposits, and see our bank balance (like the Fat Boy in Pickwick Papers) "swell visibly."

THAT by buying second-hand machines indiscriminately at fancy prices, we could re-sell at still higher prices.

THAT we could easily obtain premiums for preferential deliveries of new machines.

THAT at the present time—
There is unlimited capital for the asking,
Unlimited opportunities for making big profits.

BUT as we have no intention of sacrificing our reputation—as acquired by ten years of honourable trading—for one year's orgy of boom profits,

WE make no definite promises as regards delivery of new machines.

WE persist in our rule to only sell second-hand machines, as and when they pass through our workshop—where they are completely dismantled and thoroughly overhauled.

WE continue our policy to supply machines in strict rotation at catalogue prices.

AND—

WE are sanguine enough to think that in 1929 Godfrey's, Ltd., will be more firmly established than ever in the confidence of the Motor Cycling public.

GODFREY'S
LIMITED,
208, Great Portland
Street, London, W.1.

MOTOR CYCLES FOR SALE.

Bradbury.

1913 4 h.p. Bradbury, perfect condition throughout; £35.—Inman, 1, Othello St., Liverpool. [1370]

BRADBURY, 1913 (late), 2-speed, kick starter; £42/10.—Robertson, 39, Broad St., Peterborough. [1171]

1914 4½ h.p. Bradbury, 2-speed, pedal start, new coach sidecar; £58.—29, St. Leonards St., Bromley-by-Bow, E.3. [1427]

BRADBURY 4 h.p., 1915, free engine, excellent condition, tyres almost new, lamps, horn; £47.—Knox, 22, Edith Rd., Faversham, Kent. [1491]

BRADBURY—For the earliest possible deliveries of 1919 models try the sole Manchester agent, Tom Davies, 229, Deansgate, Manchester. [6652]

4 h.p. Bradbury Coachbuilt Combination, 3-speed, clutch, splendid condition; £65; trial, seen after 6.—7, Grove Parade, High Rd., Finchley, N. [1593]

FOR Sale, 3 h.p. Bradbury, in good order, Stewart speedometer, Grado variable gear; £30, or exchange for good 2-stroke.—Ingham, Crossley Sanatorium, Frodsham, Cheshire. [X0845]

1919 Bradbury, 6 h.p., new at Easter, twin-cyl., kick starter, chain drive, 3 speeds, free engine, and all the latest, horn and lamps; secured car.—Best offers to Whalley, Clevelly, Croston, Preston. [X1167]

BRADBURY 4 h.p. and Sidecar, N.S.U. gear, B. and B. Bosch, lamps, generator, horn, all accessories, excellent condition; £39; seen Saturdays after 5.—Glenham, Ashurst Rd., North Finchley. [1213]

BRADBURY, 3-speed, clutch, Bosch, B. and B., Druid, nearly new tyres, belt, etc., overhauled, re-enamelled, replated, with comfortable wicker sidecar; 48 gns.—Write, S., 21, Kempe Rd., Kilburn. [1371]

Brough

BROUGH early deliveries, sporting mount.—J. Blake and Co., Liverpool and Manchester. [X0439]

BROUGH, 6 h.p., little used, idle during war; expect trial; first cheque, £50.—McDermott, Shercock, Ireland. [X1046]

Brown.

3½ h.p. Brown, Bosch mag., B. and B. carburettor, good tyres, in good running order; £28.—44, Ormiston Rd., East Greenwich, S.E.10. [X1159]

BROWN-PRECISION, 2½ h.p., 1914, 2-speed countershaft, P. and H. lamps, Stewart speedometer, good condition; £34/10.—163, Loughborough Rd., Loughborough Junction, S.W. [1514]

BROWN, 3½ h.p., 2-speed, free engine, semi-T.T. bars, Amac carburettor, Simms British magneto, splendid condition; £30.—90, Crayford Way, Crayford, Kent. [1604]

B.S.A.

B.S.A., 3½ h.p., fast machine; 32 gns.—68a, Delancey St., Camden Town, N.W. [1543]

3½ h.p. B.S.A., 1914, clutch, lamps, perfect; 45 gns.—76, Western Rd., Southall, W. [1337]

B.S.A., T.T., clutch, new condition; first over £50.—318, Cricklewood Lane, Cricklewood. [1269]

NEW B.S.A.'s in stock; immediate delivery Model K.—Alexander, Agent, Wallasey Village. [1506]

B.S.A., Xmas, 1915, K., almost new Canoelet, lamps, horn, very little used; £80.—2, Chestow Rd., Newport, Mon. [X0973]

B.S.A. Combination, 3½ h.p., 2 speeds, excellent condition and running order.—64, Loughborough Park, Brixton, S.W.9. [1206]

B.S.A., 1919 models, delivery June and July.—Hadow's Motor and Cycle Works, 130, Camberwell Rd., S.E.5. [9232]

B.S.A., 1919 models, early deliveries.—Bastone's, 228, Pentonville Rd., King's Cross, London, N.1. Tel.: 2481 North. [6819]

B.S.A. 1917 Chain-cum-belt Combination, stored 2 years, practically new; £85.—Lt. Moore, Box L1272, c/o The Motor Cycle. [1202]

B.S.A., 1914, 3½ h.p., in first-class condition, new tyres; 50 gns.—199, Pentonville Rd., King's Cross. Phone: Holborn 1812. [1210]

B.S.A. 4½ h.p. Combination, Phoenix sidecar, hood, triple screen, 3-speed, clutch, as new; £90.—47, Pretoria Av., Walthamstow, E.17. [1551]

FORWARD

PLUGS.

An abundance of unsolicited testimonials from users of Forward Plugs—of which there's a type for every engine—confirms our claim that they are stronger and will stand up under harder usage than any other make—let us send you details of all our various models.

Telling Testimony to the Forward Fastener

Price 1/6.

Read this. It comes from a customer at Stoke-on-Trent.

"About three years ago I sent for one of your FORWARD Belt Fasteners for my (Big Six) Motor Cycle Combination. Up to that time I had tried almost every make of fastener, but every one failed. Almost every time I went out I broke a fastener, and I got downright sick of it. So you will understand how pleased I am to say that since I put in your Forward I have never had a break."

If you want a cheaper but excellent Fastener, there is

THE KING HOOK.

Price 1/- or adjustable 1/3.
